—— Hon. Myron H. Clark, State Senator from the Ontario District, is proposed in "The Carson League" as the Maine Law candidate for our next Governor.

—— The Sentinel notices a heavy failure in Watertown, but omits names. The loss falls mainly upon banks and bankers in that part of the State and in Canada.

—— Lord Elgin will return to his government, in Canada, immediately. The day was fixed for his lordship's departure from England, Saturday the 6th of May.

—— The United Military Force that Germany including the non-federal territories of Austria and Prussia, can set on foot, amounts to little short of nine hundred thousand.

—— Five children of Geo. A. and Mary C. Turnbull, formerly of Richmond Co., Ga., died at Jacksonville, East Florida, of scarlet fever, all within the first week of May.

—— It is stated in the Knoxville papers that a rich and extensive silver mine has recently been discovered upon the lands of Dr. R. H. Hudson, of Sevier county, Tenn.

—— The Cork reporter refers to a curious feature in the present emigration mania in Ireland—namely, a kind of panic from apprehension of being pressed for the war.

—— The Ohio Legislature has adjourned, after doing much mischief and little good. The State will have a respite of two years—the Constitution allowing only biennial sessions.

—— There is comparatively little cargo now offering at Liverpool for the United States. The Cunard Company have withdrawn their propeller Andes from the American trade.

—— A vessel arrived at New York on Wednesday week, with 158 of the religious exiles from Malaria, who are to join the Porto colonyguese ultra-converted Romanists in Illinois.

—— A fire per cent subscription has been started at Newport, Ky., to buy a pewter cup for Nat. Wolfe, one of Ward's counsel, for his "bloody hand" allusion to the people of Louisville.

—— A clue is said to have been found to the destroyers of the Pope's block for the Washington Monument. The Grand Jury of the District of Columbia have the matter before them.

—— Queen Victoria's Court went into mourning for a week on account of the death of the Duke of Parma, who lost his life in a drunken brawl, and was a most worthless reprobate.

—— The remarkable Letter on Endless Punishment, by the famous John Foster, has been republished as a Universalist tract, with an Introduction from the pen of Rev. Dr. Sawyer.

—— The Rev. Bishop Waugh, who has charge of the foreign missions of the Methodist Episcopal Church, has appointed the Rev. Otis Gibson and Rev. Joseph R. Perrie, missionaries to China.

—— An aged member of the New York Bar, the reputed author of the "Life of Jefferson," has been arrested for habitual drunkenness and disorderly conduct, at the instance of his wife.

Foreign Intelligence.

Arrival of the Africa.

The steamship Africa arrived at New York May 5th with Liverpool dates to 21st ult.

Richardson Brothers & Co., agents of the City of Glasgow, say they are not afraid of that steamer being lost. The ship was perfectly efficient, had water for forty days, provisions for sixty-five days, and coal for twenty-six days. She had 173 passengers.

A treaty of closer alliance has been ratified between France and England, and one of alliance, offensive and defensive, has been signed between Austria and Prussia.

War news from the Baltic, Danube and Black Seas unchanged, and presents no feature of importance.

The Greek insurrection assumes a shape of guerrilla warfare. Lord Stratford published a strong manifesto against the Greek government for favoring the insurrectionists. A massacre of the Greeks by the Turks at Holo was reported, but doubted.

Prince Dael is reported to have summoned Montegrin to arms against the Turks. The campaign in Asia is expected to be opened in middle of April.

Mr. Soule is still urging the settlement of the Black Warrior affair.

Sardinia and Holland repudiate privateering.

Latest by Telegraph.—A despatch from Omar Pachn confirms the previous accounts that the Turks were twice successful against superior forces at the passage of the Danube, but in obedience to orders they retreated in the line of Kurasar.

St. Petersburgh papers contain a manifesto in reply to the English and French declaration of war—it throws the responsibility of the war wholly on France and England.

It is asserted at Copenhagen that Sweden had positively entered into a secret treaty with Russia, by which an absolute enactment, forbidding more than four ships at once to enter a harbor, has been restored, and the same extended to Norway.

Liverpool Markets—Breadstuffs.—A good consumptive demand all the week. Prices closed at an advance on the week—Denniston says 3d on wheat and 1s on flour. Western canal flour 38s a38s 6d; Baltimore and Philadelphia 38s 6d a39s; Ohio 38s a39s. White U. S. wheat 11s 9d a12s 6d; red mixed 11s a11s 9d. Indian Corn—white 41s a43s; yellow and mixed 39s 6d a41s.

Gardiner & Co. quote market for beef steady—the present high rates offer no inducements to dealers—sales mostly at retail. Pork—Enquiry only for immediate wants—holders demanding very full prices. Bacon more active at the recent reduction. Hams and shoulders—no sales.

California News.

Arrival of Two Steamers.

New York, May 9.—The steamer Star of the West arrived here at nine o'clock last evening, with dates from California to April 15th.

The Star of the West brings 618 passengers, $1,116,917 on freight, and $800,000 in hands of passengers.

The George Law left Aspinwall on the evening of the 30th ult., and arrived at Sandy Hook 11½ on the evening of the 8th inst. She brings the California mails of April 18th, and $847,853 treasure on freight, and 584 passengers.

In San Francisco Harbor, on the morning of the 15th, the steamer Secretary, bound for Petalume, burst her boiler, killing fifteen persons, and wounding a large number of others.

The weather had been clear and warm during the fortnight. The produce of the mines continues large.

The branch mint opened on the 3d.

The deposites thus far have averaged about $36,000 daily.

On the 12th, a portion of the U. S. bonded warehouse broke down with the weight of goods. Loss, $8,000.

The Mexican Consul was indicted on the 3d for violating the neutrality law, by enlisting soldiers for Mexico.

Watkyns, convicted of fillibustering, was sentenced on the 7th, to pay a fine of $1,500. Emory plead guilty to the same offence, and was fined same amount.

In San Francisco, two shocks of an earthquake were felt on the 10th.

It is said that another attempt will be made to elect a U. S. Senator at this session.

A city election was held at Sacramento on the 3d, and the result was a Whig victory.

The news from Mexico is of a highly interesting nature. Santa Anna has blockaded the port of Acapulco, and the government troops, and those of the revolutionary party are busily engaged in fighting. The steamer John L. Stevens was fired at, and not allowed to communicate with the shore.

During the detention of the Stevens at Acapulco, shots were frequently exchanged without effect on either side.

Santa Anna, with an army variously estimated at from three to four thousand men, was encamped in the neighborhood, and it was expected that he would make an attack on the town during the night.

By the George Law we have dates from Callao to April 11th, and Australia to Feb. 21st.

The political affairs of Bolivia and Peru are as complicated as ever. Castilla still holds the south of Peru, where he had been proclaimed Deliverer of his country. He was in correspondence with President Belzer of Bolivia, who had promised him assistance.

Intelligence from Australia not important.

The steamers New Orleans and City of Norfolk were lying at Sidney unsold. The latter will be chartered for Callao or Panama, with passengers. Emigration was still active between Australia and Peru.

A fire at Hobart Town, Jan. 21st, destroyed property to the amount of $500,000. Mining affairs were prosperous. A monster nugget was found near Melbourne, weighing over 52 lbs!—almost pure. The price of gold was 77s a77s. 6d.

Fatal Riot at Saginaw.—The Michigan papers contain accounts of a dreadful riot at Saginaw on the 17th ult. It originated in an attempt of some 300 armed men to burn the jail at that place and rescue prisoners. The Sheriff and others interfered to put down the riot, and the Sheriff was killed. A large number of the rioters have been arrested and bound over to wait an examination.

☞ On Saturday last week three sons of Mr. Marshal Wilkins, of Hamptonburgh, Orange county, were drowned in the Wallkill. They had gone into the stream to wash a wagon, and the horse got into deep water.

Literary Notices.

A School Compendium of Natural and Experimental Philosophy.—This is the title of a new edition of Parker's Philosophy, enlarged and improved. It contains, in addition to the usual discussion of old and established philosophical principles, a full description of modern inventions and discoveries, particularly in the steam engine and the electric telegraph. The work is well printed and illustrated, and is a valuable addition to school literature. Published by A. S. Barnes & Co., N. Y. and for sale by Wanzer Beardsley & Co. of this city.

Davis's Intellectual Arithmetic.—A little work similar in character to Colburn's and others and designed for beginners in mathematics. The author is the well known compiler of a series of mathematical works extensively used in the Schools and Colleges of the United States.—Published by Barnes & Co, and for sale by Wanzer Beardsley & Co. of Rochester.

Franchere's Narrative.—This work was originally published in the French language in 1815, but has never been translated into English until recently. It is a narrative of a Canadian who went around the Horn in the year 1811, visited the Sandwich Islands and Oregon and was present at the founding of Astoria, and its subsequent surrender to the British. Published by Redfield, and for sale by Dewey in the Arcade

Putnam's Monthly for May.—A copy of this excellent periodical has been received from the publishers. It has a wide circulation and is for sale in all the booksellores. It repudiates cheap illustrations, and makes up the deficiency in the excellence of its reading matter. Dewey has also just received the April number of the *Westminster* Review.

☞ The freight house and Depot at Brantford, C. W., on the Buffalo and Brantford Railroad, was burnt, May 9th, together with two locomotives, several passenger cars, &c. Loss about £25,000.

Marriages.

In Salisbury, Herk. Co., N. Y., on the 1st inst., by Rev. W. L. James, Geo. S. Bowen, of Chicago, and Julia E. Byington, of the former place.

At Barre Centre, April 8th, by the Rev. B. Fancher, Moses Hall, Esq., of Battle Creek, Mich., and Mrs. Betsey H. Higelow, of the former place.

In Weaversville, Northampton Co., Pa., on the 27th ult., by Rev. Leslie Irwin, Mr. Hiram H. Warner, of Lima, N. Y., and Miss Harriet, daughter of Mr. Hugh Horner, of the former place.

Deaths.

In Warsaw, N. Y., April 21st of typhoid fever, Estelle M., wife of J. L. Clark, aged 30 years 11 mos. and 8 days.

In Royalton, Niagara Co., N. Y., Mrs. Hannah Bixby, aged 85 years and 6 months.

Her work well done, she has gone to her reward. A consistent Christian life of over half a century preceded and prepared for the last great change, and endeared to the church, one who was indeed "a mother in Israel." Her husband, with whom she had been united for sixty-five years; her children, to whom she was the best of mothers; her grand-children and great-grand-children, who loved and honored her, all deplore their loss—but they can scarcely mourn for her, who has escaped from a world of sorrow and pain to one of rest and happiness.—B.

Commercial.

BUSINESS AND FINANCE.

No steamer from the Isthmus since our last, although one is nearly due with a large amount of gold. The export of the precious metals for the past week is larger than it has been for the same length of time during the year.—The Asia took out over half a million, and the Union upwards of a million more, making in the aggregate $1,571,012,38 The total export of coin and bullion for the year is $9,937,073.39.

The total coinage of the United States mint for the year up to the 1st inst, was $17,481,327,88. The deposits of precious metals at the mint for the same period was $16,701,079, being a decrease on the same period of last year of near eight million dollars.

The public debt is still being redeemed at the Treasury, at the rate of about $300,000 a week, the amount of stock now outstanding being about fifty millions. The prospect of financial difficulties and the tightness of the money market, felt just now in the commercial cities, tends to drive to the government securities for redemption, particularly while the present high premium is offered for them at the Treasury.

The stock market is much depressed. New York Central is quoted at $104; Erie 70; Hudson River 65, and other stocks proportionately.

Market Intelligence, &c.

Rural New-Yorker Office,
Rochester, May 10, 1854.

Nearly every article of produce from the farm continues to bring unprecedented prices. Wheat is quoted at $2,12½, although sales of first quality Genesee have been made as high as $2,18, and the same price can be obtained to-day. Flour is offered to the trade at $9,50@9,75. Corn is higher, selling freely at 75 cents per bushel. Oats are scarce and high, bringing 48 cents.

Butter is bringing an unreasonable price for the season; wholesalers offering for it 18 to 20 cents per pound, altho' this price cannot be expected to rule many days. Eggs a cent lower, selling at 10 cents, and other things about at previous quotations.

NEW YORK MARKET—May 8.

Flour—Our market for Western and State flour is 12½ cts. better; arrivals moderate and demand steady for the home trade and the east. Canadian in good request and firmer; sales at $8. Western Canal at $8,37½@8,62½ for common to straight State; 8,75 for favorite State. Rye flour better and scarce at $6@6,25. Corn meal sells at $4 for Jersey.

Grain—Wheat, sales fair red Long Island at $2, and common red Southern $1,90. Rye quiet and nominal at $1,15@1,16. Barley quite scarce at $1,12@1,18. Oats very scarce at 60@61c for State—60@60c for Western. Corn less active and about two cents lower; sales at 85@86½c for Western mixed—86@87½c for Southern white; 88@90 for ordinary to good yellow Southern.

Provisions—There is little variation in the Pork market, and demand moderate at $14,37½ for mess; prime dull at $13,50. Lard dull and prices unchanged; 9½@9¾ common to prime. Butter in good request at 20@25c for fresh State; 14@17c for Ohio. Cheese 10@12c.

ALBANY MARKET—May 8.

Flour—The demand for Western and State flour continues active for the supply of the east and the home and river trade. Sales at $8,75 for good State; $9,50@9,75 for extra Western; $9,75@10,25 for fancy State, and $10,50@11 for extra Genesee.

Grain—There is nothing doing in wheat. Genesee to arrive is held firmly and limited at $2,50. Corn—sales of round yellow, delivered at the Boston depot, at 85c. Barley continues in good request—ordinary Wisconsin to arrive by canal, at $1,10. Oats remain firm; sales from store at 54c.

BUFFALO MARKET—May 8.

Flour—The demand for choice brands of Michigan and Ohio flour for the home trade continues good. Sales at $8,-50@8,75 for good to choice Ohio; $8,25 for ordinary do; $8,37½ for good Indiana; $7,75 for upper lake; good Wisconsin at $7,75.

Grain—Wheat in fair demand for milling, and holders of prime firm. Sales white Ohio at $2,06½@2,07, and red Ohio at $1,99; mixed Milwaukee at $1,95. Corn more active at 66c. No sales of Oats.

Canal Freights continue active at 16½, 16½@17c on corn to New York. Wheat shipped to Albany at 17c, and Barley at 13½c.

NEW YORK CATTLE MARKET—May 1.

We have to record another material advance in the prices of Beef Cattle, the result chiefly of a scarcity consequent upon the late severe weather, preventing supplies reaching market. As it is, purchasers have been obliged to submit to an advance of $1 per cwt. We revise our quotations to correspond:—Beef Cattle $9@11; Cows and Calves $30@40; Veal Calves 4@5½c. Sheep 5½@15; Swine (gross weight,) 4@4½c. Veal and Pork were in good supply, and do not share in the advance of Beef. Both Swine and Calves are cheaper than last week, and Sheep about the same.

CAMBRIDGE CATTLE MARKET.—May 3.

At market 436 Beeves, no Stores. Market Beef—Extra, $9@9,25 per cwt.; 1st quality, $8,50@8,75; 2d do, $8@8,25; 3d do, $7,57; ordinary, $7@7,50. Hides, ₩ cwt. $6,25@6,50. Tallow $8,25@8,50. Pelts, $1,37@1,87. Calf Skins, 13c ₩ lb. Veal Calves from $4 to $10.

Stores—Working Oxen—from $122 to 200.

Cows and Calves—$31 to $42@50. Two years old—$38 to $42. Three years old—$45 to $100.

Sheep and Lambs—1,503 at market. Prices—Extra—$6 to $8@10. By lot—$3,50, to $5@5,87.

Swine—Wholesale, Shoats 4@5c; soft hogs 5, and hard fat at 6½c per lb.

BRIGHTON CATTLE MARKET—May 4.

At market 650 Beef Cattle, 20 pairs Working Oxen, 50 Cows and Calves, 1,500 Sheep and Lambs, 1,500 Swine.

Prices—Beef Cattle—The supply not being equal to the demand prices advanced. Extra $8,75@9,25; first quality, $8@8,50; 2 1. $7,75@8; 3d, $6@7,50. Working Oxen—No Sales noticed. Cows and Calves—$24 to $50. Sheep—$6 to $8@9. Swine—Better prices obtained. Shoats to peddle, 6½ and 6¾ for York shoats and 5@5¾ for sows, and 6@6½ for barrows. At retail from 6 to 7½.

Publisher's Notices.

THE WOOL GROWER AND STOCK REGISTER.

Vol. VI.—Enlarged and Improved!

The fact that the circulation of the W. G. & S. R. has more than *trebled* during the past two years, and is daily increasing, induces us to venture an enlargement and improvement, which will at once render the work far more acceptable and valuable, if not indispensable, to all engaged in Wool Growing, the breeding of Improved Stock, or the rearing of Domestic Animals generally. Though our arrangements are not entirely completed, we can safely announce that—

On the commencement of its Sixth Volume, July, 1854, the Wool Grower and Stock Register will be enlarged to Thirty-Two Pages monthly, printed upon new and handsome type, and essentially improved in other respects. The Yearly Volume will comprise 381 octavo pages,* or *double* the number contained in the present, (exclusive of the advertising cover, which will probably be omitted.)—This will give ample room for the discussion of many subjects which require attention, but which we can scarcely notice with our present limited space. Among other matters, we propose to publish Pedigrees of pure bred cattle, horses, sheep, &c., and to give the names, residence, &c., of the principal breeders of improved Stock throughout the country—for the mutual benefit of owners and those desirous of purchasing.

Arrangements are making to improve the *quality*, as well as increase the amount of reading matter. Regarding the reliability and value of its Contents as of far more importance than the size or appearance of the paper, we shall endeavor to secure the assistance, as contributors to its pages, of the best and most experienced writers on the various subjects discussed,—and cordially invite the co-operation of all disposed to aid in enhancing its value and usefulness.

Although we hope to double the *value* of the paper, its subscription price will not be increased—except perhaps to clubs of 20 or over. Single copies will be furnished at Fifty Cents—5 copies for $2, and 8 for $3. ☞ The first five volumes, bound in colored paper, will be sent post-paid, and the numbers of the 6th volume as issued, for $3.

The attention of all interested in the subjects and objects of a Stock Journal, is respectfully solicited. The readers of the Rural New-Yorker are especially invited to give the W. G. & S. R. an examination, and, if approved, their encouragement. Specimen numbers, &c., cheerfully sent, gratis, to all applicants. Address

May, 1854. D. D. T. MOORE, Rochester, N. Y.

Premiums for Subscribers!

In order to reach and reward every one who may lend a portion of influence in support of the Rural New-Yorker, we offer the following liberal gratuities for subscribers obtained previous to the 1st day of July, 1854:

1. FIVE DOLLARS, in Cash, or a copy of Webster's Unabridged Dictionary, (or $6 in Agricultural Books,) to each person sending payment for fifty or more yearly copies [or month subscriptions proportionally,] according to our terms, previous to the 1st of July, 1854.

2d. FIVE DOLLARS, in Books, or four extra copies of the Rural, to every person remitting payment for forty or more subscribers, as above.

3d. THREE DOLLARS, in Books, or a handsomely bound volume of the Rural for 1853, to every person remitting for thirty subscribers.

4th. To every one remitting for twenty copies, [$25,] we will give an extra copy of the Rural, and four (the present and three past) volumes of The Wool Grower and Stock Register—or,

5th. To every one remitting for ten copies ($15,) an extra copy of the Rural and three volumes (past or present) of the Wool Grower—or, instead of vols. W. G., $1 in Books.

6th. To every one remitting for six copies ($10,) an extra copy of the Rural, either volume of the Wool Grower, and a bound Vol. of Genesee Farmer for 1848.

7th. To every one remitting for three copies ($5,) either volume of the Wool Grower, and a bound volume of Genesee Farmer for 1848.

All competitors for premiums are expected to adhere strictly to the following

TERMS IN ADVANCE:

Two Dollars a Year. Three Copies, one year $5 Six Copies for $10—Ten Copies for $15—Twenty Copies for $25, and any additional number at the same rate. Clubs for six or nine months at proportional rates. Names of club subscribers written on the papers, and sent to different offices.

☞ As we are obliged to pre-pay the American postage on all copies mailed to British Provinces, our lowest club rate to Canada subscribers is $1,50 per copy.

☞ Specimen numbers, &c., furnished free to all disposed to compete for Premiums, or who desire to extend the circulation of the New-Yorker. Subscription money properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

Advertisements.

MANNY'S PATENT REAPING AND MOWING MACHINE, WITH WOOD'S IMPROVEMENT.

This machine, as upon trial at Geneva, was found on bringing it into use by different hands, and under less favorable circumstances, not to work well. As now constructed, while it retains the good points that all conceded it possessed last year, is entirely free from the defects that caused it to prove so unsatisfactory to the farmer as a Reaper, on account of the difficulty in discharging the grain, its want of capacity and strength; and as a Mower, in its defective cutting apparatus, and its liability to clog and break, and its unwieldiness and complicated construction. The machine, as improved and now manufactured, is without front wheels, has a flat and capacious platform for grain, the speed is increased one-fifth, and three-fourths inch added to the length of cut. A smooth edge is used for grass, and sickle edge for grain. The guard cap left open behind so as to prevent all clogging, and the machine is built much stronger, with 200 pounds less weight.

The subscriber was early in last harvest, convinced of the necessity of these alterations, and immediately commenced and matured them in time for a thorough trial both in grain and grass, and now offers them to farmers on the following warrantee:—My combined machine weighs 700 lbs., and is warranted capable of cutting an acre per hour of any kind of grass, as well as ordinarily done by hand by the best mower, and to work well as a Reaper. I have a machine for mowing alone, which is warranted as above, and weighs 630 lbs. Either machine will take one-fourth less power to mow than any other mower made.

Price of the Combined Machine, delivered on the cars at Hoosick Falls, $125 cash. Price of the Mower, $110 delivered to the farmer. Orders should specify which is wanted, the Combined Machine or Mower. Machines can be ordered of H. M. Chapin, No. 68 So. St. Paul st., Rochester; Gen. R. Harros, Wheatland; Sylvester Harmon, Mumford, or from WALTER A. WOOD,
227-2t Manufacturer and Proprietor,
Hoosick Falls, Rensselaer Co., N. Y.

GREAT PUBLIC SALE OF BLOODED STOCK.

The subscriber, having spent the most of the past winter and spring in Kentucky, has selected from the choicest herds of blooded cattle, upon the different plantations of that country, upwards of one hundred head of the best specimens of the Durham blood, a part of which are from the old Ashland Estate of the Hon. Henry Clay.

He has also selected about one hundred fat cattle, eighty-five of which are *spayed heifers*; also about five hundred sheep, most of which are coarse wooled, about one hundred ewes and lambs, the balance are fat wethers, weighing from one to two hundred pounds each; also a few pairs working oxen and mules. The above stock will be imported into this country in May, and will be sold at public auction, on the farm of Richard Peck, two miles east of Lima village, Livingston county, N. Y., on *Friday, June 2*, 1854.

The sale will commence at 10 o'clock, A. M., and continue until through. Carriages will run to the place of sale, from the cars at West Bloomfield and Honeoye Falls, on the Niagara Falls Railroad.

The subscriber is confident that this stock is *fully equal*, if not superior, to any former importation into Western New York. He is also of the opinion, that, with the variety of climate, and the abundant resources and facilities of this vast country for the improvement of stock, we are no longer under the necessity of subjecting ourselves to the enormous expense and hardships of resorting to the "Dimily Fraternity" of England; for, after having received from our old "Matron," her best blooded stock and most scientific crosses, we can soon teach her what she already fears, that her "feminine majesty" will soon be obliged to exchange her treasures, for a selection from our own stock, paying equally as liberal for the privilege as we have formerly done.

A liberal credit will be given at the above sale, hoping that all will avail themselves of this opportunity to improve the stock in this country. JOHN W. TAYLOR.
May, 1854. {227-3t} East Bloomfield, N. Y.

THE DANSVILLE MODEL WATER-CURE,

Is one of the most capacious, convenient, and best arranged establishments in the country. The situation for health, and beautiful and romantic scenery is unsurpassed. The main building is 100 feet by 40, and four stories high, with bath rooms on every story, furnished with the *softest* and *purest* water in the world. In front of the building are four porches, making in the aggregate, a promenade of four hundred feet in length. The medical attendance will be all that can be desired, and experienced and capable persons will be employed as bath attendants. Mrs. Stephens, female physician, has had several years experience in the treatment of diseases of her own sex. The proprietors and physicians intend to spare no means that can be employed, that will hasten a sure and permanent cure of their patients, and that can render their stay at their establishment pleasant and agreeable.
Address Dr. W. M. STEPHENS,
227-3t&ow Dansville, Livingston Co., N. Y.

THE PEOPLES PATENT OFFICE

This well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the Inventions. No fee or charge is made for such examinations.

Private consultations held daily with inventors from 9 A. M. to 5 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid, ALFRED E. BEACH,
Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only One Dollar a Year, sent by mail. Specimen copies 12½ cts. Address as above.

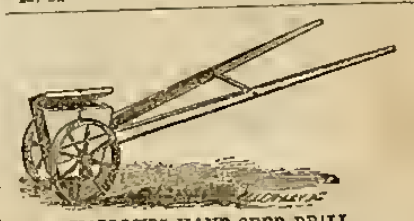
FOREIGN PATENTS.

The undersigned continues to act as Solicitor and Agent for securing Patents in all countries where they are granted. He is represented in Europe by honorable and reliable men, of long tried experience, through whom he is enabled to secure Patents in England, Scotland, Wales, Ireland, France, Belgium, Germany, Austria, Russia, Prussia, Spain, Portugal, &c. His facilities for transacting foreign Patent business are unsurpassed. He can generally obtain Certificates of Provisional Protection from the British Patent Office, within six weeks from the time the invention is first committed to his care. The cost of British and other foreign Patents, to Americans, has been greatly reduced.

The undersigned may be at all times consulted, free of charge, by letter, or personally at his office, in reference to Patents, Inventions, &c. All consultations and business strictly private. For further information, apply to or address, ALFRED E. BEACH,
227-4t Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau-street, New York.

IMPORTED TOBACCO SEED.

We have on hand some choice varieties of Havana and Cuba Tobacco Seed, which will be sold in packages. For one dollar we will sell one package or two half packages of different varieties, accompanied with pamphlet directions for cultivation. Address H. C. WHITE & CO.,
227-2t Buffalo, N. Y.



HALLOCK'S HAND SEED DRILL.

This Drill is adapted to sowing carrot, turnip, beet, onion and other small seeds in drills, with perfect regularity and without regard to their weight or shape. The seeds are forced out by a circular brush, which revolves against a perforated tin plate inserted in the bottom of the hopper. A series of these plates accompanies each drill, with holes of different sizes for regulating the quantity and kinds sown. It is a light, compact, and durable machine, and not liable to get out of order. 240 of these Drills were sold last season, giving entire satisfaction. They are warranted to perform as above stated. They can be forwarded to any part of the country by railroad or stage. Remittances by mail at my risk. All orders (which should give full directions for forwarding,) promptly attended to.—Price $5. Address E. D. HALLOCK,
227-2t 24 Exchange St., Rochester, N. Y.

IT IS NOW TIME TO PLANT!

At the Rochester Seed Store, opposite the Arcade, Buffalo Street, I can supply all kinds of Seeds, and the implements usually wanted by the farmer or gardener. I have Seeds of my own growing; also those of my own importation from England, France and Germany, which I will sell at as low rates, as can be had in this country, both at wholesale and retail.

Clover Seed.—Medium from Ohio, and the large kind grown in this county, at market prices.

Timothy Seed—from Wisconsin, at market prices.

Peas.—Large Marrowfat—Early Washington—Early Kents, (the earliest variety)—Early Prince Albert, (imported)—Blue Imperial (imported)—and all the other varieties worth cultivating, by the bushel or quart.

Beans.—Lima—China Red Eye, &c.

Corn.—Stowell's Evergreen Sweet Corn, at 50 cents per quart.

Poland Oats—At $1.25 per bushel.

Mexican Potatoes—of my own raising, at $4 per barrel delivered at the Rail-Road.

Osage Orange.—New seed, just from Texas, at $16 per bushel, or 75 cents per quart.

Orders by mail, enclosing the money, will be promptly attended to. The seeds forwarded without delay, or the money returned. JAMES F. FOGG.
Rochester, May 8, 1854. 227-2t

PURE SUFFOLK PIGS FOR SALE.

The subscriber has four pair of pure bred Suffolk Pigs for sale. Price, $16 per pair. Also one boar pig; price $8. Can be forwarded by Railroad or Canal.
Address E. H. GILBERT,
May 10, 1854. {227-2t*} Nunda, Liv. Co., N. Y.

BONE DUST.—We can supply a few barrels of genuine coarse bone dust, at $2.50 per barrel.
227 H. C. WHITE & CO., Buffalo Ag'l Warehouse.

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

Emery's Horse Powers, Threshing Machines and Separators, Circular and Crescent Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use—Hoed Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—Grass, Field and Garden Seeds, of the best imported and Shaker growth.
E. D. HALLOCK.
Warehouse and Sale Rooms No. 24 Exchange Street, Rochester, N. Y. 226-tf

"HALTON" (1,552.)

My *first premium* Short-horn Bull, Halton, will serve a few cows this season, at $10 each. Thoroughbred Short-horn cows, $20 each; to be paid in advance. Cows not proving in calf, may be returned at any time within four months.

I shall have a few Short-horns for sale this summer, (male and female,) from premium animals. S. P. CHAPMAN.
Mount Pleasant Farm, Clockville, Madison Co., N. Y.
May, 1854. 226-4t eow*

IMPORTED HORSE "CONSTERNATION."

This well known thorough-bred horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of Youatt.

Terms—$10 the season, $15 to insure, *payable in advance in all cases*. Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No mare will be served that is either ring-boned, spavined, or blind. J. B. BURNET.
Syracuse, N. Y., May 1, 1854. 226-3tw-3im

MEXICAN AND SWEET POTATOES.

The genuine "Mexican Wild Potatoes" at 2 dollars per bushel; and Sweet Potato plants at 1 dollar per hundred, will be forwarded by railroad or express to any address, and in any desired quantities, on the receipt by mail of the money or postage stamps. Give plain directions.
Address I. W. BRIGGS,
226-3t West Macedon, Wayne Co., N. Y.

CALCINED BONES.

The subscribers have some hundreds of barrels of calcined bone-dust, a valuable manure, which will be delivered on the Railroad or boats at $1,25 per barrel of three and a half bushels. Orders by mail will receive the most careful attention. {225-4t} H. C. WHITE & CO.

ENGINE AND BOILER!

The subscriber has an "A, No. 1" 10 to 12 Horse Power Engine. Has been used 3 months only! Will sell cheap!
Address PETER SANE, P. M., Yates, Orl. Co., N. Y.
April 20, 1854. 226-3t.

AGENTS WANTED.

Chances for making Money!—The Publishers of a large list of highly entertaining, useful and popular books, offer great inducements to 500 energetic and thorough-going business young men, to engage in the sale of these publications, in which any young man of good business habits may make FIVE TIMES the amount, over and above all expenses of the average wages of Common School Teachers. The most liberal discounts are made to Agents from the list of prices. The Books command ready sales wherever they are introduced. None need apply on ess they wish to devote their whole attention to the business, and who cannot command a cash capital of from $25 to $100, or give undoubted security for the amount of goods entrusted to them.

Full particulars in regard to terms, &c., will be furnished by calling on, or addressing, post-paid,
WANZER, BEARDSLEY & CO.,
24 Buffalo street, Rochester, N. Y.,
Or, ALDEN, BEARDSLEY & CO.,
225-3t Auburn, N. Y., Publishers.

CHOICE EGGS FOR HATCHING.

TIME IS MONEY.

BY WILLIE WATSON.

Time is money, says the traveler,
Let me not a moment stay;
I shall surely lose my passage
If an instant I delay.
Then again I must tie over,
Pay new bills, and lose a day;
Thus I lose both time and money,
Surely, I must haste away.

Time is money, says the farmer;
If I want a crop of grain,
I must sow my seed in season,
Or my toil will be in vain.
Time is money, says his neighbor,
As he lists the thunder roar;
Let us save the well dried clover,
Ere 'tis ruined by the shower.

Time is money, says the student,
As he nears commencement day;
If I lose another hour,
I shall fall in my essay.
Failing to receive promotion,
I another term must stay;
Health, and strength, and money wasted,
I can ill afford delay.

Time is money, says the merchant,
Not a moment can I spare;
I must hasten or I lose it,
Sales like that are very rare.
I may save a full month's profits
If this bargain I secure;
I must make a speedy effort,
Time is money, that is sure.

Time is even more than money;
Money lost may be regained,
And with proper care and prudence,
For a space may be retained.
But our time is evanescent,
Making for us no delay;
And may never be recovered,
If it be once thrown away.

Rural Sketch Book.

(Written for the Rural New-Yorker.)

THE UNCERTAINTY OF LIFE.

AN INCIDENT OF THE NORWALK TRAGEDY.

"Yet this is life! No mark from day to day;
Youth in the freshness of its morning prime,
Passes like the anthem of a breeze away,
Sinking in waves of Death, o'er chilled by time,
E'er yet dark years on the warm cheek had shed
Autumnal mildew o'er its rose-like red!"

On a pleasant May morning, far away from friends and home, with a heart light and joyous, at the prospect of soon mingling with those whose affection and kindness had won his gratitude and love, might have been seen a young, beautiful, and manly form. Long had he reveled among the beauties of Nature; studied her mysteries, admired her charms, and wondered at her magnificence. He had seen the towering grandeur of her mountains, the gloomy pomp of her wild-wood, the velvet robes of her vallies, the clear and glassy expanse of her lakes, and the beauty of her rivers. He had listened with awe to the thunder of her cataracts, and the moan of her ocean waves. Art had beckoned him to her choicest seats—pleasure, to her festive board, and passion to her gayest halls. Wealth had won for him regard; talent, admiration; and beauty, love.

But amid all the varied pleasures he had enjoyed, the curiosities he had admired, the changes he had seen, and the regards he had won, he could not forget the home of his childhood, among the rough, rugged "hills of New England." He could not forget the thousand recollections that clustered round that rude, but hallowed spot. He could not forget that brother's affection, nor that sister's tenderness and love; and less than *all*, could he forget the kindness and solicitude of that father, or that mother's fondness and caress. Oh! he remembered a father's prayer for his safety and return; and a mother's farewell tear at his departure! All these rushed with electric speed upon his mind, and his bosom burned again to mingle in those happy scenes.

I see him in the busy haunts of the crowded metropolis, wending his way toward the railroad station, with heart elate and beaming eye. Every step seems lighter, and every look brightens with joy, at the thought of loved one's far away. With the shriek of the steam-whistle, the rumbling wheels, and the heavy tramp of the engine, that gay and jovial throng dart through vallies clad in robes of green, through forests fanned by vernal breezes, and over landscapes whose velvet carpets sparkled with May-dew. All! all! how joyful and gay. Yet with him gayety and mirth seemed nought but thoughtlessness and folly. Memory and affection were still true to their trust, and he thought of the happy hearts awaiting to greet him. He saw a mother's smile, and heard a father's welcome. And, as if endeavoring to anticipate their greetings and reciprocate their affection, he enters in his memorandum, with true-hearted simplicity, the following record of his devotion, and the testimony of his filial love: "*Friday morning, now for home; Dear Father—Dear Mother!*"

Home! how the sound of that sweet word flashed its hallowed memories o'er his mind.—He could see in the distance a faint outline of the blue hills over whose cragged slopes he had spent the sunny days of childhood. He is almost there. A tear of joy dims his eye as he repeats those fond words—"*Dear Father, Dear Mother!*" How often he has breathed them forth in the devotion of his soul, while far away. Ah! how hope lightens his heart, as the future rises and unfolds itself to his view. He looks out upon the verdant landscape of his own beautiful Connecticut, with its bosom of glass, and margin of green. Little did he think that those waters which were among his native mountains, and rippled by his native heath, would prove to him the *river of death!* But alas! it is too true! The fatal plunge is given, and all his brightening hopes are shrouded with the pall of death—

"Ere sorrow's rude gale had breathed o'er his soul,
Snapped was life's frail cord, and broken the bowl."

How sad the commentary upon life. How delusive human hope. How mournful the wreck of youth, of beauty, and of happiness—Young K—— is no more! No more as an hour since—the pride of a kind and affectionate father, or the hope of a fond and loving mother. No more the associate of those who had learned to love him for his virtues, and court him for his worth. No more will he indulge in those bright and flattering hopes with which fortune had tempted him. Sad and mournful are the hearts which death has smitten. Long will those gloomy and disconsolate parents shed tears of unavailing grief, over the grave of a fond and dutiful son. But he has bequeathed to them a rich, a priceless legacy. "Dear Father—Dear Mother!" How simple and touching the last tribute of tenderness and affection. When shall that inscription be effaced from that Father's heart, or those tender accents cease to echo on that mother's ear?—Let that epitaph be enchased on the marble which marks his earthly pillow. Let it teach mankind the frailty of human hopes, and the vanity of earthly ambition. Though the hand that inscribed it be cold, and the heart that prompted it be still; yet it spans the tomb with a bow of promise and lights its darkness with the touch of Hope. 'Tis thus with man—

"He cometh like the flower,
To feel the changes of each earthly hour."

The tender flower has been gathered to dust, it will bloom on earth no more.

Soon nature shall garland that place of rest,
Where the cold clod lies on its slumbering guest;
Soon the soft breeze of summer shall channel through the gloom
Of the cypress, which shadows his early tomb;
But memory's page no shadow shall mar,
While that spirit pure, as some new-risen star
Shall beam in the home of the angels on high,
Where sorrows ne'er darken the cloudless sky;
While that spirit-voice shall echo above,
Where the rainbow of Hope is melted to Love.

THE FIGHTING PREACHER

WESTERN ITINERANTS FORTY YEARS AGO.

The western itinerants, (who were the *legion fulminea* of the American ministry of their day,) were usually brawny, athletic men, physically if not mentally educated almost to perfection. They had occasion sometimes to preach to their rude hearers with their stout fists, as well as their stentorian lungs. "At a camp meeting," says Mr. Finley, "a row was raised on Saturday by some twenty lewd fellows of the baser sort, who came upon the ground intoxicated, and had vowed they would break up the meeting. One of the preachers went to the leader for the purpose of getting him to leave; but this only enraged him, and he struck the preacher a violent blow on the face and knocked him down. Here the conflict began. The members saw that they must either defend themselves or allow the ruffians to beat them and insult their wives and daughters. It did not take long to decide. They very soon placed themselves in an attitude for defence. Brother Birkhammer, an exceedingly stout man, seized their bully-leader who had struck the preacher, and with one thrust of his brawny arm crushed him down between two benches. The aid-de-camp of the bully ran to his relief, but it was to meet the same fate; for no sooner did he come within reach of the Methodist, than with crushing force he felt himself ground on the back of his comrade in distress. Here they were held in durance vile till the sheriff and his posse came and took possession, and binding them with ten others, they were carried before a justice, who fined them heavily for their misdemeanor. As soon as quiet was restored, Bishop Ashbury occupied the pulpit. After singing and prayer, he rose and said he would give the rowdys some advice: 'You must remember that all our brothers in the church are not yet sanctified, and I advise you to let them alone; for if you get them angry, and the devil should get in them, they are the strongest and hardest men to fight in the world. I advise you, if you do not like them, to go home and let them alone.'

In speaking of one of his brother itinerants—one to whom it is owing 'that Methodism is now the prevailing religion in Illinois"—he says:

At the camp meeting held at Alton in the autumn of 1833, the worshippers were annoyed by a set of desperadoes from St. Louis, under the control of Mike Fink, a notorious bully, the triumphant hero of countless fights, in none of which he had ever met an equal or even second. The coarse, drunken ruffians carried it with a high hand, outraged the men, and insulted the women, so as to threaten the dissolution of all pious exercises; and yet, such was the terror the name of their leader, Fink, inspired, that no one individual could be found brave enough to face his prowess. At last, one day, when Mr. —— ascended the pulpit to hold forth, the desperadoes, on the outskirts of the encampment, raised a yell so deafening as to drown utterly every other sound. Mr. ——'s dark eyes shot lightning; he deposited his bible, drew off his coat and remarked aloud:

"Wait a few minutes, my brethren, while I go and make the devil pray."

He then proceeded, with a smile on his lips, to the focus of the tumult, and addressed the chief bully:

"Mr. Fink, I have come to make you pray."

"By golly, I'd like to see you do it, old shorter."

"Very well," said Mr. ——, "will these gentlemen, your courteous friends, agree not to show foul play?"

"In course they will. They're rale grit and won't do nothin' but the clear thing, so they won't," rejoined Fink, indignantly.

"Are you ready?" asked Mr. ——.

"Ready as a race horse with a light rider," squaring his ponderous person for the combat.

But the bully spoke too soon; for scarcely had the words left his lips, when Mr. —— made a prodigious bound toward his antagonist, and accompanied it with a quick, shooting punch of his herculean fist, which fell, crashing the other's chin, and hurried him to the earth like lead. Then even his intoxicated comrades, filled with involuntary admiration at the feat. But Fink was up in a moment, and rushed upon his enemy, exclaiming—

"That wasn't done fair, so it warn't."

He aimed a ferocious stroke, which Mr.—— parried with his left hand, and grasping his throat with his right, crushed him down as if he had been an infant. Fink struggled, squirmed, and writhed in the dust; but all to no purpose; for the strong muscular fingers held his windpipe as in the jaws of an iron vice. When he began to turn purple in the face, and ceased to resist, Mr. —— slackened his hold and inquired;

"Will you pray now?"

"I doesn't know a word how," gasped Fink.

"Repeat after me," commanded Mr. ——.

"Well, if I must, I must," answered Fink; "because you're the devil himself."

The preacher then said over the Lord's prayer line by line, and the conquered bully responded in the same way, when the victor permitted him to rise. At the consummation, the rowdies roared three boisterous cheers.—Fink shook Mr. ——'s hand declaring:

"By golly, you're some beans in a bar-fight. I'd rather set-to with an old he bar in dog days. You can pass this 'ere crowd of nose-smashers, blast your pieter."

Afterwards Fink's party behaved with extreme decorum, and Mr. —— resumed his bible and pulpit.

A thousand other incidents, equally material and ludicrous, are related as to Mr. ——'s adventures in Kentucky and Illinois. Many of them are probably fictitious; but those genuine alone, if collected, would be sufficient to stock at least two volumes of romantic reality.—*National Magazine.*

THE LOVE OF HOME.

It is only shallow-minded pretenders who either make distinguished origin a matter of personal matter or personal merit, or obscure origin a matter of personal reproach. Taunts and scoffing at the humble condition of early life, affect nobody in America but those who are foolish enough to indulge in them, and they are sufficiently punished by the public rebuke. A man who is not ashamed of himself need not be ashamed of his early condition. I did not happen to be born in a log-cabin, but my older brothers and sisters were born in a log-cabin, raised among the snow drifts of New Hampshire, at a period so early that when the smoke first rose from its rude chimney, and curled over the frozen hill, there was no similar evidence of a white man's habitation between it and the settlement on the rivers of Canada.—Its remains still exist; I make it an annual visit; I carry my children to it, to teach them the hardships endured by the generations which have gone before them. I love to dwell on the tender recollections, the kindred ties, the early affections, and the narrations and incidents which mingle with all I know of this primitive family abode. I weep to think that none of those who inhabited it are among the living; and if I ever fail in affectionate veneration of him who raised it, and defended it against savages and destruction, cherished all domestic comforts beneath its roof, and through fire and blood of seven year's revolutionary war shrunk from no toil, no sacrifice, to serve his country, and to raise his children to a condition better than his own, may my name, and the name of my posterity be blotted forever from the memory of mankind.—*Dan. Webster.*

COURAGE OF A LAPLAND GIRL.

The skill of the nomade people of Lapland in throwing the lasso avails them, at times, in making captives of other animals besides their own deer. "On one occasion," so said a clergyman whom Mr. Lloyd met with in Nordland, and who vouched for the truth of the story, "when a Lapp, in company with a young female, was driving the herd through the forest, they accidentally roused a large bear from his winter quarters. The girl, very fortunately, had the lasso in her hand, which, with great coolness and skill, she threw over his head, as he was slowly quitting his den, and at the same instant coiled the other end of the thong around a tree. The brute, on finding himself thus in the toils, dashed at the intrepid Amazon, but, as she slipped on one side, he fortunately missed his aim, and on coming to the length of his tether, was, in sailor's language, brought short up and thrown to the ground.—Brain's career was now at an end, for, seizing the thong with his paws, and by so doing tightening the noose, he prosently managed to strangle himself. The Lapp, on seeing the beast charge the girl, took fright and ran away; and, as a consequence, the bold wench, who was to have been married to him, sent him at once to the right about, very properly refusing to have anything to say with so dastardly a fellow."

Youth's Corner.

ILLUSTRATED REBUS, NO. 21.

☞ Answer in two weeks.

(Written for Moore's Rural New-Yorker.)

MISCELLANEOUS ENIGMA.

I am composed of 34 letters.
My 8, 4, 7, 8, 18, 22, 12 is an evil practice.
My 2, 27, 26, 9, 31 is a fabulous deity.
My 21, 33, 30, 13, 24, 11, 7, 29, 31 is knowledge.
My 10, 23, 26, 29, 4, 18, 15 is anguish.
My 1, 7, 25, 13, 29, 26 is sagacity.
My 8, 7, 8, 17, 5 is a guide to truth.
My 28, 4, 29, 14, 31 is the insignia of royalty.
My 3, 6, 16, 18, 14, 29, 33, 19, 20 is the name of a person.
My 32, 34, 4, 29 is a beginner in learning.

My whole was the saying of a Patriot and Statesman.

☞ Answer next week.

[For Moore's Rural New-Yorker.]

Algebraic Problem.—A and B bought 100 acres of land for $600, each paid $300; A takes the part most valuable, and gives one dollar an acre more than B, and each ones share amounts to $300. What was each man's share of land, and at what price per acre?

☞ Answer next week.

Answer to Illustrated Rebus No. 19.—*I. Bowdish, Post-Master, Rool, N. Y., C. Hubbs, Assistant.*

Answer to Miscellaneous Enigma in No. 18.—*Equal Rights of Woman with Man.*

Answer to Problem in No. 18.—17 *miles*, 99 *rods*, 123$\frac{3}{4}$ *feet.*

Wit and Humor.

Personal.—A beautiful Jewess attended a party in Philadelphia, where she was exceedingly annoyed by a vulgar, impertinent fellow, "And you never eat pork, Miss M.?" asked he, tauntingly. "Never, sir," was the reply.—"Nor use lard lamps?" continued the persecutor. "No, sir," she answered, "our religion teaches us to avoid everything swinish, physically and morally; therefore, you will excuse me for declining to have any more words with *you.*"

The "Sons and Daughters of Vermont," held a grand Family Festival at Lowell, recently. Saxe was invited to "hold a butt," but being compelled to decline the invitation, sent the following proxy:

Vermont.—Famous for the production of *four* great staples, namely:—*Men, women, maple-sugar and horses.*

The first are strong—the last are fleet;
The second and third are exceedingly sweet;
And all are uncommonly "hard to beat."

Conundrums.—Why is four cent sugar like a man that never surrendered? Because it's "clear grit," and nothing else.

Why is dancing like new milk? D'ye give it up? Because it strengthens the *calves.*

Why is a telegraphic dispatch like a singing master? Because it *beats time.*

An old bachelor geologist was boasting that every rock was as familiar to him as the alphabet. A lady, who was present, declared that she knew of a rock of which he was wholly ignorant. "Name it, madame!" cried Cœlebs, in a rage. "It is *rock the cradle*, sir," replied the lady. Cœlebs evaporated.

"In short, ladies and gentlemen," said an overpowered orator, "I can only say—I beg leave to add—I desire to assure you—that I wish I had a window in my bosom, that you might see the emotion of my heart." Vulgar boy from the gallery.—"Wouldn't a pane in your stomach do this time, old feller?"

A member of a western debating club, wishing to display his proficiency in the languages, when moving for an indefinite adjournment of the club, said—"Mr. President, I move we adjourn *E pluribus unum!*"

EDWARD HARRISON'S PATENT GRIST MILL

Received the highest premium at the World's Fair; and more than 250 of them have been sold within two years. The stones are French Burr; the frames and hoppers, cast iron; and the spindles, cast steel. They will work both for flouring and on all kinds of grain, and will keep in repair longer than any other mill. Having just completed my new buildings for manufacturing and running them, I am now prepared to supply all orders for all the sizes, from 20 inches to four feet diameter, including a superior farm and plantation mill, which will grind corn in the best manner, by horse-power, or even by hand. Public attention is invited to this small mill in particular. Descriptive circulars, with cuts, sent to post-paid applications.

225-31* EDWARD HARRISON, New Haven, Ct., Sole manufacturer, and Proprietor of the Patent.

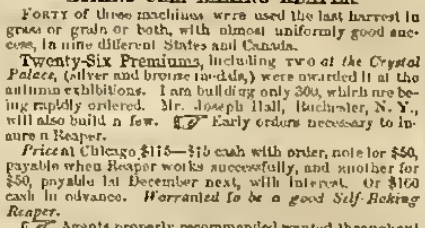
NEW YORK RECORDER.

Tenth Volume Enlarged, in quarto form. The Largest Baptist Newspaper in the World! Price, in advance, by mail, $2; by carriers, $2,50. Luther F. Beecher & Co., Proprietors, 122 Nassau Street, New York.

In the determination to make their journal a complete repository of general and denominational religious intelligence, and of the news of the day, as well as the earnest advocate of sound Christian doctrine and social progress, the proprietors will summon for these ends every available facility, whether editorial, or in the way of contributors or correspondents. They have engaged able writers at home, and their correspondence from England and Continental Europe, from Asia and every part of America, they believe to be unsurpassed. By furnishing a paper of the highest grade, from this great commercial centre, they hope to increase the patronage with which they are already favored from every section of the United States and the neighboring British Provinces.

The tenth volume commenced March 29th. Subscriptions are solicited, and the present is suggested as the best time for forwarding names with payments accompanying.

S. S. CUTTING. [223-6tw] L. F. BEECHER.



KETCHUM'S IMPROVED MOWING MACHINE,

With entire change of Gear, the only Successful Mower Now Known.

Ketchum's *Improved* Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: *durability, convenience and ease of action.* The shafts now have bearings at both ends, which overcomes all cramping and pulling away of boxing. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being *on upper side of the frame;* all caps are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its whole width, which protects it from wear.

These and various other additions for strength, durability, &c.; make them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

It requires not over ten minutes to get one ready for operation, there being but two bolts, (besides the pole bolts,) to be secured to have one ready for use. They will cut *all kinds of grass*, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair; it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make this machine deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying *untried* Mowers: if they do (as was the case with many last year) they will incur loss, vexation and disappointment.

If any parts are wanted to repair any machine we have sold, or may hereafter sell, they will be furnished and only manufacturers' cost for the same be charged.

☞ In all cases where extras are wanted, be sure to give us *the number of your Machine.*

(Warranty:) That said machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of *any kind of grass*, and do it as well as is done with a scythe by the best of mowers.

The price of the Mower, with two sets of knives and extras, is $110 cash, in Buffalo, delivered on board of boat or cars free of charge.

Office and Shop, corner of Chicago street and Hamburgh Canal, near the Eastern N. Y. Depot, Buffalo, N. Y.

HOWARD & Co., Manufacturers and Proprietors.

The Mower is also manufactured by Ruggles, Nourse, Mason & Co., at Worcester, Mass., for the New England States.

By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan.

By Warder & Brokaw, Springfield, O., for Ohio and Kentucky. 228-4t.

J. Rapalje & Co. are also sole Agents for the sale of Ketchum's Mowing Machine in Rochester, and for the vicinity. 220-1jy m11-31

ATKINS' SELF-RAKING REAPER

Forty of these machines were used the last harvest in grass or grain or both, with almost uniformly good success, in nine different States and Canada.

Twenty-Six Premiums, including two *at the Crystal Palace*, (silver and bronze medals,) were awarded it at the autumn exhibitions. I am building only 300, which are being rapidly ordered. Mr. Joseph Hall, Rochester, N. Y., will also build a few. ☞ Early orders necessary to insure a Reaper.

Price at Chicago $115—$10 cash with order, note for $50, payable when Reaper works successfully, and another for $50, payable 1st December next, with interest. Or $100 cash in advance. *Warranted to be a good Self-Raking Reaper.*

☞ Agents properly recommended wanted throughout the country. Experienced agents preferred. It is important this year to have the machines widely scattered.

Descriptive circulars with cuts, and giving impartially the differences as well as successes of the Reaper, mailed to post-paid applications. J. S. WRIGHT.

"Prairie Farmer" Warehouse, Chicago, Feb., 1854.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 26 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

The Wool Grower and Stock Register is the only American journal devoted to the Wool and Stock Growing Interests. It contains a vast amount of *useful and reliable* information not given in any other work, and should be in the hands of *Every Owner of Domestic Animals*, whether located East or West, North or South.—Published monthly in octavo form, illustrated, at Only Fifty Cents a Year—5 copies for $2; 8 for $3. Vol. 5 commenced July, 1853. Subscriptions can begin with the July or January number. Back volumes furnished.

Address D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper.

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:
J. H. Bixby,—H. C. White,—T. E. Wetmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete Agricultural, Literary and Family Newspaper.

☞ For Terms, &c., see last page.

Rural New-Yorker.

Progress and Improvement.

SPECIAL MANURE THEORY.—No. I

"Give me an analysis of your soil, an analysis of the crop you desire to raise, and send me $25 for a letter of advice, and I will inform you how to grow immense crops at a tithe of your present outlay. If you desire to have an abundance of strawberries of superior size and quality, manure them with tannic acid, for I have found, on analyzing the strawberry, that it contains a large quantity of tannic acid.—Letters asking advice respecting preparation and application, enclosing a suitable fee, will meet with due attention. Wheat, corn, barley, oats, tobacco, cotton, sugar cane, and all grasses, contain large quantities of phosphate of lime; therefore, if you wish to have good crops of these important staples, dress liberally with improved superphosphate of lime—to be had at any of the principal warehouses, price $50 per ton. If this does not supply all the missing constituents of your soil, the salt and lime mixture—full particulars for the manufacture of which will be found in my back volumes, price $4 per set—cannot fail to make it produce such crops as your unscientific neighbors—mere farm laborers—never dreamed of in their old grandpa philosophy." Such, in substance, are the reiterated recommendations of some of our modern self-installed agricultural instructors. One would think that the mercenary feature of such shallow pretences would put the agriculturist on his guard. But such is not the case. Farmers, conservative though they be, are led away by mere clap-trap plausibility, and cheated of their hard earnings more than any other class in the community. Witness the success of "Professor" (?) Comstock in the west, and of an equally celebrated "Professor" (?) in the east. However, we have done what we could to explode their humbugs, and if farmers will be cheated, it is their fault, not ours.

The doctrine of special manures, as popularly understood, is interwoven in nine-tenths of all the agricultural literature of Europe and America. It is only in the hands of charlatans that it assumes the shape we have depicted in the above sketch. Liebig, the most popular and fascinating of all chemico-agricultural writers, first propagated the doctrine of special manures. It is his pet idea. In its elaboration he has put forth all the powers of his brilliant genius. No wonder, therefore, that agricultural writers should be dazzled with the theory, and think that at length the millennium of agriculture had arrived. So strong were Liebig's own convictions of the truth of his theory, that he took out a patent for an artificial manure which was to revolutionize the whole system of agriculture. But the manure was a complete failure, both in England and in this country. Nothing is now heard of this patent manure, but the theory on which it was based is still as popular as ever. We have good private authority for stating that within the last few months, Liebig's views on this subject have materially changed. Yet his admirers are still propagating the doctrine with unabated zeal, and as is generally the case, the more hands it passes through the more ultra and ridiculous it becomes.

Dismissing Liebig, however, let us look at the doctrine as it is generally received by intelligent, reading farmers. Many with whom we have conversed on the subject appear to think that wheat contains this particular ingredient, corn that, grass another, &c. In other words, that wheat, corn, grass, &c., are each composed of different substances,—that there is some ingredient in wheat that is not found in corn, and something in corn that is not contained in grass, &c. Now the fact is that *all* our commonly cultivated agricultural plants *are composed of precisely the same elements*, the only difference being in the relative proportions of the ingredients. Thus when chemists designate wheat and corn as phosphoric acid plants, turnips and potatoes as potash plants, clover and flax as lime plants, beans and peas as nitrogenous plants, all they mean is that, compared with other crops, these particular substances predominate.

The question, therefore, which we wish to consider is not whether plants which contain potash, for instance, require more potash in the manure than plants which contain no potash, for *all* plants contain potash; but whether the plant which contains a large proportion of potash in its ash, requires more potash in its manure than a plant which contains but a small proportion of potash. Or, in other words, must the relative proportion of substances in the manure correspond with the relative proportion of constituents in the plants cultivated. The ash of wheat contains five times as much phosphoric acid as the ash of turnips,—ought, therefore, wheat manure to contain five times as much phosphoric acid as a turnip manure?

At first sight every one would answer this question in the affirmative. Nine-tenths of our agricultural writers unite their powerful voices in crying YES, and it requires some considerable nerve to deny the truth of such an obvious, plausible deduction. Yet practical experience, our first and best agricultural teacher, says NO. And carefully conducted experiments say NO. We hold that one inductive fact outweighs a world of theory, however plausible, and are fully satisfied that the composition of a plant affords no certain or satisfactory indication of what substances are best adapted as manures for it. This will appear a strange notion to some, but next week we hope to present facts which fully sustain it.

REARING CALVES.

In rearing full blooded, high priced animals, when the object is simply to raise fine calves, without any regard to cost of keep, allowing the calf to run with the cow is probably the best course to pursue, as it certainly is the most natural. But in ordinary cases, when butter commands a good price, we should never allow rearing calves to suck the cow. Fresh milk is eminently nutritious, and, furthermore, is just adapted to the wants of a young animal. Until the calf is a week or so old, perhaps nothing can be substituted for fresh milk, but afterwards a gradual substitution may take place with no detriment to the calf; and it is certain that the same amount of nutriment can be obtained in a variety of substances at much less cost.

In England it is generally customary to give rearing calves "linseed tea," mixed with skimmed milk. Many think that calves do better on this food than on fresh milk alone. The linseed is soaked in cold water for forty-eight hours. It is then placed in a cauldron, with seven quarts of water to one of seed, and boiled gently for about two hours, and constantly stirred, to prevent burning at the bottom. It becomes gelatinous on cooling. About half a pint of the jelly is given to each calf, thoroughly mixed with warm skimmed milk, twice a day. Instead of linseed, oil-cake meal is frequently used. Two large table-spoonfuls are given to each calf twice a day, increasing the quantity with the age of the calf. It is easily prepared. Moisten the meal with cold water and then pour over it a quantity of hot water, and let it simmer on the stove for a short time, just precisely as in making milk porridge. It is then stirred into the milk with the hand, crushing all the lumps. The calves are exceedingly fond of it. For calves of six weeks old, we prefer it even to linseed itself. It is more nitrogenous, and it would appear to be better calculated to favor muscular development and bone formation than linseed, or fresh milk alone. Pea meal or Indian corn meal, is also employed for mixing with skim milk, as a substitute for the loss of butter in the milk.—Rice meal, sago, and many other rich carbonaceous foods, are also recommended; but for rearing calves, linseed, oil-cake, or pea meal, in our opinion, is far preferable to any other substance.

Rearing calves should not be tied up. They require exercise. A small paddock or orchard, with a warm shed to run into in stormy weather and nights, is best. When calves are young, green grass generally produces looseness or diarrhea. As long as they are lively and take their food well, there need be no apprehension from a thin discharge of feces. Milk thickened with wheaten flour, or a little prepared carbonate of lime, are good for looseness, and if the case is serious, a few drops of laudanum may be given. In case of costiveness, rhubarb is the best aperient for calves, though castor oil and Epsom salts are frequently given. But the less medicine a calf or any other animal gets, the better. A little care in regard to their food, will generally render medicine unnecessary. If they are troubled with the louse, give them a little sulphur; it will purify the blood, and rid them of the parasite at the same time.

We need hardly remark that if you desire to have good animals, you must not starve them when they are young. No matter what the breed may be; Durham, Devon, Hereford, Ayrshire, or Native calves, can never make creditable cattle unless they are supplied with a full quantity of nutritious food, and are well cared for in other respects. An old friend of ours, who knows, or thinks he knows, a thing or two, always will have it that "breed goes in at the mouth." And the old gentleman is about half right; for though high feeding will not convert an ill-bred calf, into a thorough bred animal, yet the difference between an animal which was half starved when a calf, and one which has been well and judiciously reared, is quite as great as between our native cattle and the best of imported blood.

DON'T ATTEMPT TOO MUCH.

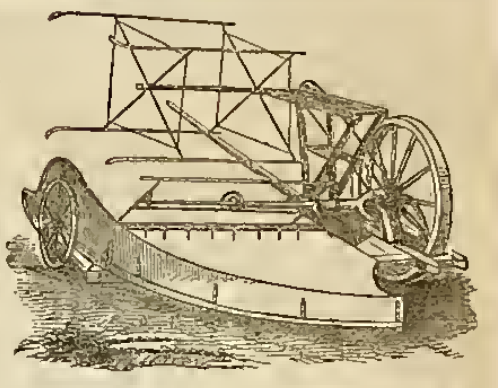
The more we see of farms and farm management, the stronger is our impression of the great need of *concentration of expenditure* in labor and capital, upon four-fifths of the cultivated soil of the country. The contrary system—that of *expansion*—prevails, the ground is "gone over" carelessly and imperfectly, when it should be farmed thoroughly and well.

This may be thought a harsh statement.—But let us look at it. Is it good policy to *expand* the labor of putting in a crop over six acres, when at the same cost, a like result may be realized from three or four? Will you be content with thirty bushels of corn per acre at an expense of, say, ten dollars, when by adding labor and manure to the amount of two or three dollars more, you may have sixty bushels? Will you grow inferior stock with the same amount of food, when by a larger outlay at first, you may have the best—those always saleable at good prices—while the unimproved scarcely find purchasers at any price? You will not, if you consider the subject, carefully and understandingly.

"Much labor on little land," is the secret of success in farming. Capital is needed so that every facility and advantage may be improved, and the more land a man works on the system of expansion in farming, the poorer he will be in the end. Think over the matter, brother farmers! Is it not best to either concentrate your labor upon less land, or increase your expenditure for the purpose, so as to embrace the whole farm in a thorough course of culture? To drain, manure, plow deep, plant and sow the best seed, cultivate well and harvest in season,—and above all, to attempt no more than you can do well?—B.

Lay thy plans with prudence, and be prepared for emergencies.

PALMER & WILLIAMS' REAPER.



Messrs. Editors:—Having been several times referred to for information respecting the practical operation of Messrs. Palmer & Williams' Self-raking Reaper, I am induced, at the request of the manufacturers, Messrs. Ganson, Huntly & Co., of Brockport, N. Y., to give to the public, through the Rural, a communication relating to said machine, accompanied with a cut of the same. I would here remark, that I have no interest in said machine, and no purpose to serve any one more than the farmer.

It is certainly a matter of great interest to the farmer to know which amongst the many reaping machines now manufactured in our country, is most deserving credit, or most useful,—but that is a problem which perhaps few, if any, could answer to the satisfaction of all. To say which is the best reaping machine in use is not my purpose, but that Palmer & Williams' reaper is what it is claimed to be, a perfect self-raking machine, has been proved to my entire satisfaction by a thorough trial of it through a large harvest, and under the most unfavorable circumstances. The invention of the reaper for cutting grain, has marked an important era in Agriculture, and has elicited the highest encomiums upon American genius. And why should it not? It is a triumph of success over the many efforts of all past ages. Many have been the trials to bring the labor of beasts of burden to assist in reaping the golden harvest, but with little or no success.—It has ever been performed emphatically, "by the sweat of the brow." The cutting of grain by machinery has ceased to be an experiment; it has become a fact unquestionable, but still it has not been divested of all hard labor, as the aching back and lame sides and breast of many a man, who has raked from the machine in heavy grain, could testify. But here, fellow farmers, is a machine that will perform *all* the hard labor in cutting your harvest; you have only to ride over your fields in a comfortable seat, and drive your team, while your grain is cut in a perfect manner, and laid in gavels, ready for the binder, at any distance required, if operated by the driver, and in better order than is commonly done by hand raking.

The machine is drawn by two horses, and will cut fifteen or twenty acres a day, according to driver, or as much as any other machine in use, the rake being no hindrance,—requiring less strength of team than any other reaper I am acquainted with, and I have used several, and seen in use nearly all the different machines in our country. The mechanical construction of this gives several advantages over most reapers in simplicity, which renders its operation easy and the machine durable.

Whatever of praise is due to those who were first to bring the reaping machine into successful operation, it detracts not in the least from their credit to say, that this machine possesses important improvements, which cannot fail to be appreciated by the farmer, and to gain for it one of the highest positions among this class of labor-saving machinery. F. P. Root.

Sweden, N. Y., May, 1854.

PROFIT OF KEEPING HENS.

Few farmers expect, or realize, anything of any amount from their poultry. Hens are left to take care of themselves, as a general thing, while sheep and other animals, from which they cannot possibly realize so large a per cent on the cost, occupy the whole of the breeders time and attention.

Now, let us suppose that a man owns 300 hens, and takes care of them as he ought. He selects six acres of respectable land—makes a good fence around it, and divides it in the middle. He puts up a good warm building, 12 by 40. In one of these three acre yards he keeps his hens during the summer, plowing it once in two or three weeks, for their benefit. The other yard he plants to corn; the crop being sufficient to keep his hens through the winter. They lay, on an average, 200 eggs each per annum, or 6,000 a year in all, which are worth at a low estimate $600,00. The hens should be changed from one yard to the other every year. H. L. S.

CONVERSATIONS ON AGRICULTURE.—No. III.

BY HUGH T. BROOKS.

"This is a regular *lamb killer*," said a neighbor, as he shook the *snow* from his cap and took a seat by my fireside, half an hour ago. I had just been congratulating myself that most of my stock was under cover, and a *portion* had something to eat. "Everybody wants to buy *hay*, and nobody has any to sell," continued my friend. This certainly did not come under the head of *consolation*, but it may take its proper place as a *caution*. When will the "bone and sinew" learn the rule of "proportion"—so many months, for so many tons of fodder? I am ashamed of my stock," said one of our most discreet cattle breeders. "I am short of hay?" "Short of hay," I will give the meaning of that phrase for the next edition of the "farmers' dictionary." Predominance of bones in cattle—a falling of the owner's upper lip; early market of *wool*—no sale of the *carcass:* war among the women and the *calves*, about a *little mess of milk;* teams "letting their *moderation* be known unto all men," while their less scriptural *drivers* are perfectly oblivious to the *third* commandment; meadows and pastures forced to discount in the spring, and taking their revenge by stopping payment in the summer; a settled conviction that farming *is* unprofitable.

We often see cattle that have been pretty well wintered, fall away rapidly by being turned out upon short, flashy, and innutritious grass. They go back in three weeks, about as much as they will go forward in three months. At this season of the year we should have plenty of the *very choicest* of our fodder, to tempt their appetites with. I would make it a rule to put all of my stock into the yard nights, and feed them good hay, in good racks, under good sheds, for several weeks after I first turned them to grass; a little meal would be a profitable addition.

The change from green food to dry in the fall, and from dry to green in the spring, should be *gradual*. "It is a very poor speculation to buy hay at eight or ten dollars a ton, to feed to farm stock," says Mr. Duncan Cameron, "but it is much better than to scrimp them."

The "ways and means" of getting through the next winter need immediate consideration. "Have you a good supply of pasture? If not, arrange for it immediately, or sell off a portion of your stock. "Animals well summered are half wintered," says the proverb, and a very good proverb it is *for warm weather*. If farmers would balance their accounts with their *fields* as carefully as they do with their *tailors*, they would find a great deal of land under "*cultivation*," as they misname it, which had much better "*go to grass*." Stock down to timothy or red top—not clover—land that is cold, wet, and heavy, unless you will ditch it and make it dry. It is useless to charge upon "Providence" and the seasons, the reported failures and deficiencies that we constantly see in many parts—Providence won't father these abortions any longer. A ton of hay affords more *clear profit* than you will ordinarily get from an acre of poor ground put to corn or wheat. Mr. Olmsted, of Parilion Centre, is much in favor of sowing corn for fodder, but then Mr. Olmsted has good ground and puts in his crops well. He sows in May with a drill, or furrows three feet apart and scatters in the corn pretty thick, covering it lightly with a plow, and then runs a cultivator through, at the hoeing season, to loosen the ground and destroy the weeds. He is careful to bind up

his fodder and set *it up immediately*, till it is *well* cured, when it may be put in the barn and mixed with straw. He sometimes feeds his corn fodder to his stock when the feed is short in August.

Superfluous plowing is not the only mistake of American farmers. We frequently see ground that produces very little feed, and which needs to be well *plowed* and *pulverized*, and *subdued*, and then seeded down again, before the life of the land is gone by washing or cropping. The loss occasioned to American farmers by the practice of feeding just enough to make stock "hold their own," is beyond all computation. Unless the animal is "going ahead," all that is fed to it is thrown away. This is the great and overshadowing error of our husbandry.

FINE AND COARSE POTATOES:

WHICH ARE MOST PREDISPOSED TO THE DISEASE?

We generally classify potatoes either as good or bad, in proportion to the abundance, or the deficiency of the farina which they contain.—Some varieties are naturally mealy, while others are as naturally soapy and waxy. Judicious culture, indeed, may greatly ameliorate inferior kinds; at the same time, the very best tubers may be deteriorated by injudicious cultivation, or by an undue application of sea weed, strong animal manures, &c. "We know," says Liebig, "that the quantity of starch in potatoes increases when the soil contains much humus, but decreases when the soil is manured with strong animal manures; although then the number of the cells increases, the potato acquiring in the first case, a mealy, in the second a soapy consistency." If you examine a potato closely, when cut into two or several pieces, (says a Scotch writer,) you will be able to analyze it into three distinct portions. Beneath the outer skin there is a finer envelop, varying in thickness, according to the kind and qualities of the tuber. This nether lining contains more farina, in equal quantities, than the inner part or heart of the potato. Inside, however, you find more juice, and nature in this way, has provided a double protection, against not only undue absorption, but the numerous causes tending to the hindrance of vegetable life.—The juices of vegetables subserve all the purposes of the blood in animals, and both are strong or weak, healthy or sickly, in proportion to the quantity and quality of the constantly circulating fluid which sustains life. Bad blood, as is well known, leads to bad breeding among the domestic animals, and it is the same with vegetables. The utmost care, therefore, should be taken, from first to last, to preserve the juice of tubers set aside for seed.

In "highly elaborated and perfectly matured potatoes," may there not be an undue proportion of starch over the mucilaginous, fibrous and watery portions of the tuber? For altho' nature intended the farina as a shield or protection against undue absorption of the vegetable juice; yet, may not an excess of starch in the potato, like an excess of fat in the animal system (for there is a kind of analogy between them,) be viewed as an indication of disease, rather than of sound health? Hence, many farmers experienced in potato-culture have insisted that those tubers raised for seed alone, should not only be late of being planted, but that they should be early lifted in order that they may be full of juice, to nourish the young bud, before its roots are capable of collecting sap from the ground. This practice may be repudiated by some, and we don't advocate the system, but merely mention it in order to show the importance attached to a copious supply of the vegetable juices in seed tubers. Indeed every experimental cultivator must have observed that the nearer the cuts are taken towards the extreme end of long potatoes, the better the crop will be, while the nearer the root or stem end, the sets become proportionally inferior. The eye next the root is entirely worthless. Why is this? Probably because there is a greater deposition of the vegetable juice towards the depressed end. The *watery end* produces more vigorous plants, from the circumstance that from the greater abundance of sap it may impart greater energy of growth. Practical gardeners are aware of this, if farmers are ignorant of it, and frequently plant cuts taken only from what they sometimes call the "*nose end*," in order that they may not only raise a more vigorous, but an *earlier* produce. Cuts of this kind will produce potatoes eight or ten days earlier than sets taken from the stem end. Now, it is well known that in potatoes, such as the Yam and Merino, the farina is less abundant than in finer varieties; hence, as we have formerly shown, from Liebig, a greater accumulation of the vegetable juice; and hence, also, the plants arising from them are more vigorous, and better enabled to resist the blight or disease.

Whatever may be the true cause, the matter is indisputable, that the coarser the variety, or less farinaceous, the potato is less subject to disease. Another thing that may not be generally known; potatoes yielding *red* blossoms are more subject to disease than those yielding *white* ones. I have observed that all tubers bearing white blossoms were naturally watery, however much they might be improved by cultivation, while those with red ones were naturally of a mealy consistency. What is the cause of this?

In a former paper, I stated that it may be laid down as a general rule, that "the less farina a tuber contains, the more likely it is to escape the disease." This I now convinced is the case, although at first sight it may not be apparent to every one. But as general rules, like axioms in mathematics, ought to be self-evident, the general rule may run thus, I hope, "without gainsaying"—"*The coarser the variety, the potato is more likely to escape the disease.*"

It is somewhat singular that the only sound ingredient in a diseased potato, wether frosted or tainted, is the farina! I have extracted the farina, both from frosted and tainted tubers, not too much decomposed—and could perceive no difference, even with the aid of a microscope, from the starch obtained from sound roots. Prof. Johnston, of Durham, by an analysis, carefully made, some years ago, published his conviction, that farina obtained from diseased potatoes was perfectly sound and wholesome. In France, it may be worthy of notice, potato flour is manufactured in immense quantities, which with the addition of wheaten flour, is used by the French bakers and confectioners in making their admirable bread, biscuit, and confectionary. In the city of Paris alone, it is stated on good authority, that one hundred tons of potatoes are annually manufactured into flour for the purpose. Thus a tainted crop of potatoes might be made to yield, to farmers, a good return in sound farina. This article, whether extracted from sound or unsound roots, forms an excellent food for children and invalids, and may be made, as in France, into soups and gruels, or used as a substitute for tapioca, sago, or arrow-root.

N. Davidson Rempath.

ONIONS,—AGAIN.

Eds. Rural:—In reference to the inquiry about onions, I offer the following:—They require a deep, well pulverized soil, made rich with well settled stable manure and washings of the road which accumulate in the ditches, or sand, which is preferable if it can be readily obtained. They seem to do better upon the same bed, for we have a bed 30 by 40 feet, which has been sowed to onions for 30 years, and the yield increases yearly.

From the 20th of April to the 5th of May is the best season for sowing. We sow in drills one foot apart, and one and a half inches in depth. The seed requires some time to germinate, and it will be from two to four weeks before the onions will make their appearance; and as soon as we can trace the rows, we pass between them with a hoe and cut up the weeds; and as soon as the onions will admit, we pull out the weeds, which must be kept down through the season if we expect a good crop of onions. The yield from our bed of onions has, for three years past, been 15 bushels per year. We prefer the yellow onion, because with us it sells most readily.

The raising of onions, like all other branches of farming, requires close attention, and who but the attentive farmer can succeed in his avocation? H. B.

Homer, N. Y., April, 1854.

UNDERDRAINING WILL KILL QUACK GRASS.

Eds. Rural:—In the Rural a few years ago, I noticed that you, or some other person, advised farmers to clear out at night and leave their farms, if overrun with quack grass. I carried the paper to one of my neighbors, who had a great quantity of quack grass on his farm, but in place of taking the advice of the Rural, I advised him to thoroughly underdrain a large field that was a complete mat with quack grass, in which he had then oats growing, but two-thirds of the crop was quack. Immediately after the crop of quack and oats were taken off, he drained the land in the most thorough manner; the next spring he plowed it for fallow, and worked it thoroughly all through summer and fall; sowed nothing in the fall; plowed early next spring, and sowed with oats. A better crop I never saw, *and not a single stalk of quack.* He has plowed and sown it this spring, and there is neither root nor branch of quack, nor any other weed to be seen, and I doubt if in your sandy gardens about Rochester, you have any in finer tilth.

Did a farmer in the State of New York, ever see quack grass on land that was dry? I never did, and I never saw wild mustard on land that was dry. John Johnston.

Geneva, N. Y.

Profitable Hens.—Mr. E. K. Morrey, of this place, has twenty-seven pullets that have laid fifty-two dozen of eggs in four months, from the first of November last to the first of March. Beat this who can. The breed is natives crossed with Shanghais; their feed, oat screenings and corn, all they would eat. They had no underground room with a stove in it, but roosted out-doors under a shed.

Lysander, N. Y., April 25, 1854. A. Eaton.

Agricultural Miscellany.

TILL LITTLE AND THAT LITTLE WELL.

'Tis folly in the extreme to till
Extensive fields and till them ill.
The farmer, pleased, may boast aloud
His bushels sown, his acres plowed,
And, pleased, indulge the cheerless hope
That time will bring a plenteous crop,
Shrewd common sense sits laughing by,
And sees his hopes aborlive die;
For when maturing seasons smile,
This sheaves shall disappoint his toil.
Advised, his empty pride expel;
Till little and that little well.
Of taxing, fencing, toil, no more
Your ground requires when rich than poor;
And more the fertile acre yields
Than the huge breadth of barren fields.

"SAVE ME FROM MY FRIENDS."

A northern agricultural editor has written an article, with his signature, in the *Southern Cultivator*, (Georgia,) the apparent object of which is to show the superiority of slave-labor over that of "*hirelings.*" He argues that African slavery descended from those Egyptians who *sold themselves* in the days of Pharaoh, to buy corn—Egypt and Guinea, we presume, being synonymous names for one and the same country, or else lying close together, like Rochester and Canandaigua! He gives us an anecdote, at length, about a free colored man in Rochester, who asked of him (and "not in ruin") for bread for his family, because he could not find employment, and intimates that slaves never have to ask for labor! He says in allusion to the necessity of mankind to labor, that "some will work for wages, but the *majority* will not"—and then argues that this majority must be treated as a father treats "an idle and refractory son,"—"if he does his duty he flogs the lad, and makes him labor," &c., from which we are to infer that the "majority" of laboring men are to be flogged into their duty! He thinks "the plow, the hoe, and the whip," are the best means to lift the laboring man from "the degradation of brutes, into the sympathies of civilized life." What will the plowmen of Western New York think of this estimate of their occupation, by the editor of no other a periodical than the *Genesee Farmer?* What will our southern friends say to this *argumentum ad flagellum*, in favor of slavery? They will hardly thank him for it.

An Exhibition of Horses will take place at Providence, Rhode Island, on June 21st and 22d, under the auspices of the Rhode Island Society for the Encouragement of Domestic Industry. On the 20th and 21st of June, there will be a Horticultural exhibition, and a show of Mowing Machines and other agricultural implements. Proprietors of mowing machines are invited to display them in operation on the 20th of June, on ground selected for the purpose. Expense of transportation to Providence will be paid. For further particulars address S. H. Smith, Providence, R. I.

Wind-Mills for Pumping Water.—A correspondent of the *Ohio Farmer*, writing from Illinois says there are several wind-mills for pumping purposes, in successful operation on Sturges Prairie. The "mills are not very expensive." We should be pleased to receive a description of them from some of our subscribers in that vicinity.

RAISING CALVES—A NEW METHOD.

While on a short visit to the farm of Mr. D. M. Crowell, of this town, a few days ago, our attention was drawn to a plan of raising calves for early sale, which, to us in this section of the country, has the appearance of novelty, and seems worthy of the consideration of stock growers.

Mr. Crowell took his calves (all heifers) last spring, and commenced feeding on sour milk at a few days old, keeping them on the same kind of food during the summer, taking good care to feed them uniformly, but not very abundantly, so as to keep them growing thickly, without forcing them too rapidly. In the fall they were put in the stables, and fed on hay, and a little meal, increasing the quantity of the latter gradually, with a view of fitting them for "Beef," in the Spring, at one year old or a little under.

These ten calves look like young oxen, and are estimated to weigh about 300 pounds each, alive. They will probably be sent to market soon, say next month, when we shall see how such "Beef" will sell, and it will be relished by the lovers of good eating. For ourselves we should hardly find it in our hearts to decline a dinner from one of the best of them. We understood from Mr. C., who is making this trial by way of experiment, that he is quite satisfied thus far with the present attempt to raise Beef in one year, and that he intends to renew the experiment another year, when he thinks some improvement can be made.—*N. Y. Farmer.*

Sheep-Shearing Festival in Wisconsin.—The Wisconsin State Ag. Society, with a view to promoting the interests of sheep husbandry in that State, have instituted an annual "Sheep-shearing Festival." The first of these festivals is to be held at Whitewater, on the 31st inst.

Sir John Sinclair says that agriculture, though in general capable of being reduced to simple principles, yet requires on the whole, a greater variety of knowledge than any other art.

MOWING.

It may not, perhaps, be amiss to offer a few remarks at this time, on the subject of mowing. There are few employments in which the young farmer is called to engage, which more severely task the physical powers, or which require a greater amount of skill and endurance than mowing. Yet every beginner is emulous of being the first, of carrying the forward swarth, and of being thought the best mower in the field. By the young, this emulation is always indulged, and if not unfrequently results, almost as a matter of course, that serious injuries are experienced by the ambitious aspirant, which, without securing any solid advantages, render his existence wretched, and entail expense and misery both upon himself and friends.

Those young men who contemplate farming as the future business of their life, should begin mowing, young. I have never yet known an expert master of the scythe, who commenced late. At the age of fourteen, the youth should be provided with a light scythe and snath, and put to work by himself. If introduced into a field with others who are older and more experienced, he will be stimulated to over exertion, and be rather disposed to excel in swiftness, than in cutting his grass well. If alone, this stimulus will be wanting, and he will rather take pride in performing the exercise with ease and neatness, than in being a "swift mower," and will not be so likely to injure himself, or "leave his wages in the field."

In mowing, there are two things of consequence to be observed. I refer to what is called "pointing in," and "pointing out." The first refers to the correct manner of entering the scythe, which should be so done, as to leave the grass on the edge of the swath, as square and even as the side of a drain, or ditch; and the latter, to the method of bringing it out—the point of the scythe entering the grass at all times, at a uniform distance from the roots, should be carried round on a level, the heel dropped so as to make level work, without any "cuttings" between the strokes, and come out on an exact level with the previous swath. The swath should be long enough to allow of the operator standing *erect*; for the more nearly the position of the body, in this exercise, approximates a perpendicular, the less will be the fatigue, and the greater the facility of execution. No good mower ever stoops, unless the habit, which is a pernicious one, has been acquired young.—An Old Mower, *Germantown Telegraph.*

REMEDY FOR THE POTATO ROT.

Permit me to state an experiment which I made for three successive years, obtaining each year corresponding results. It was simply this: Two square boxes, four feet each way, and two deep, were filled with very fine rich dirt, the dirt first being well mixed up, and then the boxes filled from it. The boxes were placed in a very warm situation; the one raised a few inches from the ground, and the other elevated two or three feet on upright sticks, which were kept well coated with tar during the season, and which had the effect of keeping the bugs from the box. Around the sides of the box was a sort of lattice work, to prevent the vines from dropping over the sides. Against the sides of the other box was raised a bank, nearly level with the top of the box.

In each of these boxes were planted each year four hills of potatoes—the white pink eyes. Four large potatoes were halved, each box receiving the half of each potato. During the season the potatoes in these boxes were kept well watered, receiving equal quantities of the fluid. The result was invariably this:—The vines in the box from which the bugs had been excluded, remained green till the frost came,—exhibiting no symptoms of the blight. The potatoes when dug, were large and perfectly sound, and remained so till the next summer. In the other box, where the vines were sometimes with potato insects and bugs, the tops were dead by the first of August. When the potatoes were dug, those in the latter box were nearly all rotten, and not half the size of those in the other box. Will you explain this phenomenon on any other principle than that of the insect theory?

To the farmer, I would say, procure those kinds of potatoes which have the greatest celebrity for resisting the ravages of the bugs. Don't plant in very rich or warm places. Plant early, and dig before the wet weather sets in in the fall. And by all means keep the potatoes dry and warm, after they are taken out of the ground.—*Tribune.*

FIELD BEANS A PROFITABLE CROP.

In our own experience we have found no crop more profitable, than the common white bean. It requires little more care than corn; on the right kind of soil it is quite productive; and almost always finds a ready market at high prices. There is no product of the soil which contains as much nourishment, pound for pound, as this. The straw makes excellent winter feed for sheep. We have found the smaller kinds to be superior to those of a larger size.

Beans require a *dry, warm* soil. We have raised them where it was so dry and sandy that scarcely anything else would grow. Our best bean crops have been upon a thin sandy soil, so filled with stones that it was exceedingly difficult to plow it at all; and where the earth over the limestone rocks was nowhere more than four inches deep. One acre of such ground we planted with common white beans for ten years successively, and never failed of getting a remunerative crop, and often had a very profitable one. This plot was plowed, planted, and hoed, at odd spells, when it was too wet that no other ground could be worked.—*American Ag'ist.*

State Poultry Fair.—At a meeting of the Managers of the State Poultry Society in Utica, on Friday week, it was decided to hold the next Fair of the Society in that city some time in November. Messrs. Sherman, Roteh, Hudson and Heffron were appointed a committee to prepare a premium list and make all further arrangements.

FARMS IMPROVED BY KEEPING SHEEP.

Citizens of wool growing districts, as parts of Washington and Fayette counties, are familiar with the rapid improvement of "Sheep-farms," by sheep grazing alone. It is the belief of many whose opinions have been formed by observations and experience, that by placing as large a flock of sheep on a poor farm as the land will sustain, and in five years, without any other means, it will be comparatively rich.—Were this fact more generally known, it might change the husbandry of considerable portions of this State, the lands of which are better adapted to wool growing, than grain growing, to say nothing of the remoteness from produce markets. The following quotations from the Transactions of the Norfolk Agricultural Society, which we find in the Wool Grower, are worthy of consideration:

"A man having a small farm, formerly kept forty sheep, four cows and one horse, and had food enough for them the year round. The price of wool falling, he sold his sheep, and for a number of years he kept other stock altogether. He now keeps but three cows, one horse the year round, and pastures two cows extra through the summer, sells very little hay—not half enough to keep another cow; he has the same amount of pasture and mowing land as when he kept the forty sheep in addition to his other stock, and yet his farm does not look near as well as then. He used to raise turnips among the corn for his sheep to eat in winter, and gave them besides, a few bushels of grain. The lambs, however, more than paid for his extra feed.

"Another farmer for a great number of years kept about sixty sheep, eight or nine cows, (or other stock equal,) one pair of oxen and one horse. After keeping the sheep for a number of years, he found he could then keep as large a stock on his farm with the sixty sheep, as he could keep without them before; showing that they had improved the farm to furnish their own support. To stock a farm entirely with sheep, would not be so profitable as to keep a limited number—yet it would pay as well as other stock. The object is to keep enough to consume that part of the vegetation peculiarly fitted to sheep, and which other stock will not eat, adding at the same time enriching elements to the pastures and yards by their manure. It is the opinion of many farmers, that pastures for other stock may be improved by keeping a small flock of sheep upon them a portion of the time, and the opinion seems fairly supported by reason and experiment."—*Farm Journal.*

Working Oxen.—Cattle need especial attention at this season. Oxen must have good hay and a little meal to enable them to do a day's work, and cows must have more attention at the time of calving than at any season of the year. A little grain or meal of some kind is the thing rather than roots, at the time when they have a good flow of milk. One quart of the best meal to each per day will not be injurious till the first of June. After that there will be substance enough in the pastures to sustain them.

The Tallest Yet.—Mr. J. Bunker, of Lowell, writes to the Lowell News, that while on a visit to Andover, he saw a stalk of corn *nineteen feet high, and it had fourteen ears of corn on it.*

Inquiries and Answers.

Winter Kill.—As a subscriber to your most valuable journal, I propose making a few inquiries—what can be done to prevent "freezing out" in the winter season? If there is any "draw back" upon the agricultural business in this section of the country, it is the uncertainty of winter crops. Having undertaken to reclaim what you term a "worn out farm," I wish to overcome every difficulty in the shortest period of time. By the use of lime, manure and deep plowing, I have entirely changed the nature of my soil, which is sandy clay or loam mixed.—My clover, which took well, continues to freeze out in the winter—can you suggest a remedy? My winter wheat and rye have continued to be injured from the same cause, although the ground does not appear to be spouty or wet, being somewhat elevated and rolling. I have underdrained where troubled with water; tho' dry, still the rye sowed upon it "freezes out"—G. W. Youngman, *Williamsport, Pa.*

Though apparently dry, your land may still contain stagnant water. Elevated and rolling land frequently needs underdraining more than low land. Perhaps this is the case with your farm. We do not see why wheat should freeze out on a loamy soil that is well underdrained or free from all superfluous moisture. We hope our correspondents will give their experience on the subject.

Is Barley good for Ewes?—About the first of the present month my ewes commenced dropping their lambs, but nine lived, their dams having no milk to support them with. They had been fed on barley with pasture until the snow storm came on, when they were again taken into the yard for three or four days, when they were again taken out to pasture, and about this time the barley was changed for corn, since which they appear to supply their young with milk, and scarcely any are now lost. Now what I wish to know is, if you or any of your numerous correspondents can tell me if it was the effects of the barley or the storm that dried up the milk of the ewes, and caused the lambs to be so much weaker than usual when they were dropped.

I find many valuable hints and much instruction in both the Rural and Wool Grower.—The latter, I think, saved me many dollars on my clip of wool last year.—A Subscriber, *York, May 10th, 1854.*

Orchard and Garden.

THE PEACH.—NO. 1.

Mr. Wm. M. Wyman gives in the Grand River Eagle, of Grand Rapids, Michigan, a couple of articles on the profit, protection and training of this tree, which contain hints of so much value, that we condense them for the benefit of the readers of the Rural. Especially may our western readers glean something valuable from them.

There are some who insist that the trouble of rearing and attending to a plantation of peach trees, more than balances the benefits derived from the fruit, so often is the crop destroyed, by unseasonable frosts, &c. Yet the peach is so easily raised and comes so soon into bearing, that, with all the untoward events, most people seem inclined to try it. And there are those who, with the right view of the matter, think it may be made largely remunerative. A plantation of peach trees, producing a full crop one year in five, will, with ordinary care and thrift in husbanding the crop, more than pay all reasonable demands for labor, rent, &c., and leave a respectable allowance for the wear and tear of conscience, in restraining the uprising murmurings of the heart, for disappointed hopes, during the intermediate four years.

However, if we take this calculation for a basis, we hardly do justice to our subject. The fact is, in this region, we hardly have one failure in five years—that is, a total one—while in the other four we have one or two enormous crops. But, to make one crop in five years pay the expense of four years' barrenness, it must, of course, be saved—not allowed to rot or spoil—because the market happens to be overstocked. Let the fruit be dried—it is worth more than the trouble, as an article of food—is cheap, delicious, and *wholesome*. Taking this view of it, one will want to plant trees in proportion to the uncertainty of the crop. If we depend upon one crop in five years, we shall want five times the number of trees we would if the crops were uniformly sure. Fruit, as a staple article of food, is becoming more and more appreciated, and must continue to be, as the race grows wiser and better; and though far from being a practical vegetarian, I fully believe that when the "lion shall eat straw like an ox," *human* diet will consist more of fruit, than of oxen.

But how shall we ward off the effects of untimely frosts on the embryo fruit or blossom, and so secure to ourselves more seasons of fruitfulness? That is the great question, and upon which much has been said and written, and various modes recommended. The one most generally relied on, perhaps, is trampling the snow hard about the roots of the tree.—This, if well done, may retard the development of the buds in the spring. To make it the more effectual, the snow when well trodden, and before a thaw comes on, should be well mulched with sawdust, tan, manure, or any good non-conductor of heat. But it is often the case that the harm to the germ is done before this sort of protection can be given. Undoubtedly, in this region at least, the present season will witness a more universal failure of the peach crop than has been since 1849. But the time of the injury differs widely. In '49, it occurred about the middle of April, when not only the *fruit buds*, but in some instances the trees themselves, were killed. In such a case the bank of snow well mulched might prove effectual. This season the work was done in December—too early for snow to be made available.

A safeguard is therefore needed, which shall apply to all such cases—one that shall keep the sap of the tree in a dormant state, from the cessation of growth in the fall, till uniform mild weather returns in the spring; sudden thawings after severe frosts, should by all means be avoided. To secure these advantages, one may gain much in a choice of location. Where it can be had, the angle of two hills that shall face respectively, north and west, is to be preferred. In such a situation, with a favorable soil and the slope just enough to shade the trees from the direct rays of the morning sun, so that the thawing shall be gradual, and the trees thus kept from being roused too soon to activity, we may reasonably hope for fair crops almost if not every season.

But when such natural protection can not be had, much may be gained by artificial protection, as the north side of high fences, of buildings, or behind rows of free growing trees, set in close order. A large peach orchard on one of the prairies of Illinois, was bordered on one side by a row of locust trees. By degrees these spread, by sprouts from the roots, until they formed a thicket, enveloping two rows of the peach trees. These two rows rarely failed to produce fruit, whilst the rest as rarely produced any. A garden in my own vicinity was bordered on the north and south sides by peach trees, so that those on the south side of the garden were on the north side of the fence, and those on the north were south of the fence. In the spring of 1849, these trees were young, thrifty, and just coming into bearing.—Those on the north side of the fence were but little injured by the severe April freeze of that year, while those on the south side of the fence were killed to the ground. Hence, it may not be with peach trees, quite as indifferent a matter as with politicians, which side of the fence they are on.

DRUMMOND'S PHLOX (Phlox Drummondi.)

This Phlox was discovered in Texas, in 1835, by Drummond, a botanical collector sent out by the Glasgow Botanical Society, who soon after died in Cuba, in the midst of his researches. This being one of the last plants discovered by Mr. Drummond, it was named *Phlox Drummondi*, in honor of its lamented discoverer.

It is one of the most beautiful of annual flowers. Indeed, the *Horticulturist* says, "we are not certain but we should be justified in calling it the finest of all. It is remarkable for the splendor and variety of its colors. Flowers from the same seed will be found in almost every shade of color, from the deepest and most brilliant rose color, to the palest and most delicate pink. Every flower, though of the deepest carmine, has the under side of its petals of a pale bluish color; and every petal, though of the palest pink, has a dark carmine spot at base. Thus the variety of colors displayed in a bed of these flowers, almost exceeds description: and when they are seen under a bright sun, and agitated by a gentle breeze, the effect is exceedingly brilliant—we know of nothing more beautiful." It is easily cultivated, and is propagated either from seed or cuttings. When any flower of extraordinary beauty is discovered, the latter mode, though the most trouble, should be adopted. The cuttings must be kept in a green-house, or warm room, during winter, and planted out in the spring. In this way some beautiful varieties may frequently be obtained. They delight in rich, mellow, well-prepared soil. The seed may be sown early in May, if the weather is fine, and in July the plants will be in full blossom. With Phlox as with all fine seeds, it is very necessary to guard against sowing them too deeply. We are persuaded more seed is lost from this cause than from any other.—They should be covered only just deep enough to exclude the light.

The Pie Plant.—A correspondent of the Indiana Farmer expresses the opinion, based upon experiment, that the use of ashes as the manure for the pie plant produces a more delicious plant than any mode of culture; not being as sour, but containing just enough acidity to make them pleasant. The reason given for this is, that the acid peculiar to the rhubarb is neutralized in part, by the alkali of the ashes.

If the above is a *fact*, it is a very important one; not so much in a practical as a scientific point of view. We should be glad to hear if any of our readers have observed a similar effect.—Eds.

To Keep Birds from Pecking Fruit.—As the season is coming on for the depredations of birds, I beg to report my experience of last year, when I saved my cherries by hanging up several pieces of tin with strong thread in the different trees, two pieces being hung near enough together to clash with the wind, which sound, with the bright reflection of the tin in the sun, certainly frightened them away; and I had my due share of the fruit, which, the preceding year, I was obliged to relinquish to them. So says a New Jersey Farmer.

Carrot seed is often steeped with advantage from 12 to 24 hours in soft water, and then rolled in sand or plaster. It is rather slow in vegetating.

STEEPING SEEDS.

The germination of seeds is a thing which many are interested in, and any method to insure their pushing into growth more speedily than usual, would doubtless be received by many with delight. I have found the following plan of steeping them to be of service in my own case. When about to sow seeds, such as peas, broad beans, French beans, &c., I collect some sheep-droppings beforehand, and put them into a vessel with water, enough to moisten them. Into this I put my seeds, but of course into something by means of which they may be conveniently withdrawn when required. Thus situated I let them remain till well soaked, when they will be in a fit state for sowing. I have found that for beans about 36 hours are required, and for peas about 24 hours. Steeping, however, does not apply to the above mentioned seeds alone; it may be practiced with advantage on many others, and doubtless many flower seeds might be safely treated in this way as well, and with success.—This will, however, very much depend upon whether the plants intended to be raised are gross feeders or not; and also whether the soil contains much organic matter or not; for of course the more it contains the less time in proportion will the seed require to sonk before being sown. This practice will be found (on poor soils especially) to be of very great service to gardeners in general; for it will not only hasten their crops, but will make them as strong and vigorous as need be; and those who have never tried it would be quite surprised to see the difference it makes; an instance of which I will now give. In 1852 I made a trial with French beans—a small quantity was placed in the soil, and at the same time a small quantity in sheep-droppings, as described, where they remained about 44 hours; they were then taken up and put in soil near the former, and the result was surprising; but at the time the former were about 8 inches high, the latter were, to the best of my recollection, nearly double that height, and their foliage testified as to the state of health the plants were in. I have since practiced steeping with good results, and others who may be induced to give it a trial will no doubt be similarly rewarded.—*Joseph Divers.*

Would they not have grown just as well, if you had steeped them in clear rain water?—*Gardener's Chronicle.*

The Fruit Crop at the South.—The heavy frosts of April, have cut off a good portion of the fruit crop. In many sections, apples, pears, peaches, plums, and grapes, have been entirely killed. It is a great loss to the poor, for fruit is one half our summer living. Even the blackberries, the poor man's bread, are almost entirely cut off. Were we without the strawberry, we should have a barren time of it.—This crop seems better adapted to Southern culture than any other fruit. Frosts may cut off one, two, three, or four crops, and yet we shall have fruit. We have a *small bed*, some ten or fifteen acres of strawberries, and on the first day of April, we never saw a finer promise of fruit; the ground was literally covered with fruit, bud and blossom. A succession of frosts killed all the buds and fruit, and now, May 1st, the beds are loaded with fruit in every stage again. We are more than ever convinced, that the strawberry is the surest fruit crop that can be raised at the South.—*Soil of the South.*

Lime Dust on Plants.—An English orchardist protects his trees from caterpillars and other insects by shaking over the young foliage quick lime pulverized and sifted through a fine sieve. The time for using it is in the dew of the morning, or whenever the leaves are damp. He has found it very effectual.

Mechanic Arts, &c.

GAS FOR COUNTRY USE.

By a new invention, people living in towns where no coal gas is or can be profitably formed, may still obtain the luxury of a brilliant home-made gas-light, at a cost cheaper than that of the ordinary oil or fluid. We witnessed this important improvement in complete operation, a few evenings since, at the residence of a well-known literary and scientific gentleman on Spring Hill, Somerville—being the first house into which it had been introduced in this section of the country. The light produced is superior to that of coal gas, being clearer and more powerful, as the flame is of fuller volume and burns with greater steadiness, while the expense is about the same as coal gas at $2,50 per thousand feet. It is the combustion of benzole, a resinous liquid, sold at $1,50 per gallon, mixed with atmospheric air—the gas being generated by an ingenious and not inelegant apparatus, which may stand in the house entry-way, or even be placed on a closet shelf, and from which common gas fixtures may extend in all directions and give the light in any or every room at pleasure. The apparatus generates no more gas than is immediately consumed, and requires for the purpose only the heat of one of the burners used as a light—so that the whole cost of the gas is that of the apparatus and the benzole.

An apparatus of sufficient capacity for a good sized dwelling house is offered for $150. It is so constructed, that by means of a rotating air pump, which is revolved by a cord and a weight wound up by a crank, a stream of air is forced into the generator, which is partially filled with benzole. The generator contains a vaporator exposing a large surface of benzole to the action of the air as the latter is forced through both apartments by the pump and weight—and the thus vaporized benzole combining with the air produces a gas of the highest quality for illumination. The apparatus is so perfectly simple, safe and durable that it may be managed by the dullest domestic, only requiring the weight to be wound up before use and the generator to be filled twice a month, or not as often as all the lights are employed.

This beautiful invention was patented in August last by Mr. O. P. Drake, a practical electrician of Boston, and must be regarded as one of the most utilitarian improvements of the times. It is applicable to houses, shops, hotels, factories, or other places in the country, and even on shipboard. Hereafter the dwellers on the remotest hill-tops, or, in the deepest shades of the "back woods," may enjoy as much as those of the cities in the way of artificial "enlightenment."—*Boston Transcript.*

THE INVENTOR OF RAILROADS.

We hear the question asked, who was the inventor of the railway? and have never heard it satisfactorily answered; and we believe there are very few persons in this country who know anything on the subject. Some few years ago, Howitt, of the People's Journal, gave a somewhat lengthy sketch of the alleged inventor, who, up to May, 1836, had been neglected in England. While thousands had been enriched by his brilliant scheme, he had remained forgotten—forced by poverty to sell glass on commission, for a living. How many of the railway projectors, agitators, stockholders, &c., have heard of the subject of these remarks?—

"About half a century ago—the exact year is not known—there was born at Leeds, Eng., a man named Thomas Gray. Scarcely anything is known of his early history. He was, we believe, a poor collier; and being very ingenious, he conceived the idea of facilitating the transportation of coal from the middle town colliery of Leeds, a distance of three miles, by means of a sort of railway which he constructed of wood. Upon this his cars moved at the rate of three and a half miles an hour, to the great merriment of a wise and discriminating public, who laughed at the idea of a railway as something very visionary, and as the mere suggestion of laziness. Poor Gray tho't otherwise. Magnificent visions of future railways, such as are now stupendous realities, loomed up before him, and he began to talk in public of a general system of iron railroads. He was, of course, laughed at, and declared a visionary, moon-struck fool. But the more Gray contemplated his little railway for coal, the more firmly did he believe in the practicability and immense usefulness of his scheme.—He saw in it all that is now realized, and he resolved in spite of the ridicule, the sneers and rebuffs that were heaped upon him, to prosecute his undertaking. He petitioned the British Parliament, and sought interviews with all the great men of the kingdom; but all this had no effect except to bring down upon him, wherever he went, the loud sneers and ridicule of all classes. Still he persevered, and at length engaged the attention of men of intelligence and influence, who finally embraced his views, urged his plans, and the result is now before the world. Thomas Gray, the inventor of railroads, who, no longer ago than 1820, was laughed at for even mentioning the idea, still lives in Exeter, England; in the full realization of his grand and noble railroad schemes, for which he was declared insane. How much has the world been benefited by his insanity?"

A Rival to Hemp.—The East India Co. have forwarded to the Manchester, (Eng.) Commercial Association some samples of certain fibrous grasses, said to grow in Assam and other districts of India. One of these samples is identical with the fibric known as China grass, and has been valued by Messrs. Marshall, of Leeds, at £48 to £50 per ton.—Another of the samples seems calculated to rival the Russian hemp, as in a recent experiment the former bore a strain of 345 lbs., while the latter could only sustain 160 pounds.

COKE OVENS.

Guillaume Lambert, of Mons, in the Province of Hainault, Belgium, has applied for a patent for a useful improvement in coke ovens. The first part of the invention consists in constructing, arranging, and combining the ovens, two by two, in such a way that the smoke and gaseous products generated in one during the earlier stages of the coking process may be burned in the other, which was charged earlier and in which the coking has progressed to a more advanced stage, and may deposit therein a portion of their carbon, and that the incombustible products of combustion may, by passing in contact with the exterior of the oven in which the process is least advanced, serve to assist in heating the charge and setting free the gases. The second part of the invention consists in certain means, by which each or any one of a long range of coke ovens may be discharged of the whole of its contents at once. We consider that every improvement in the manufacture of coke is a great public benefit. The time has now arrived when either coke or anthracite must be used on all the railroads in the Eastern States, New York, and Pennsylvania, in place of wood. Coke is the fuel which has always been used on the English railroads, and will be the only kind used on our Western railroads at no distant day.—*Sci. Amer.*

CUT OFF-OF STEAM ENGINES.

Thomas Ashcroft, of Boston, Mass, has applied for a patent for an improvement in the cut-off of steam engines. The cut-off to which this improvement is applicable, is one that is well known, consisting of two plates working on the back of the slide valve. Its nature consists in furnishing the cut-off plates with two inclined planes, one for each plate—facing each other, and in placing between these, two inclined planes and an adjustable stop-bar with which the inclined planes come in contact, to arrest the cut-off plates in their movements with the slide valve, thus cutting off the steam at some point, in the first half of each stroke of the engine.

The stop-bar will arrest the motion of the cut-off plates, and cut off the steam sooner or later according as it is nearer or farther from the valve, and hence by properly adjusting it, the steam may be cut off at any desired point under half stroke. By attaching it to a "governor," it may be made to act upon the plates, so as to govern the engine by the cut-off.—*Sci. Amer.*

Paper from Wood.—At the last sitting of the Societe d'Encouragement pour l'Industrie Nationale, of Paris, a paper was read setting forth a plan for making paper from wood.—The bark is first taken off the wood, and the wood cut in such a way as to be easily made into shavings; the shavings are then cut very thin: next they are placed in water for six or eight days, then dried; afterwards they are reduced to the finest powder possible by means of a corn mill. This powder is then mixed with the rags which serve to prepare the pulp of paper, and the ordinary operation of paper-making is proceeded to. All white woods, such as the poplar, the lime, and the willow, are suitable for the purpose, but the discoverer ascribes a good deal of his success to the quality of the water he employed, that of the little river Dollar, which runs near the Mulhouse. For the first experiment he employed the wool of the trembling poplar, and he presented specimens of paper from it.

Chloroform Counteracted.—Dr. Robert de Lambelle, a distinguished physician of Paris, announces that a shock of electricity, given to a patient dying from the effects of chloroform, immediately counteracts its influence, and returns the sufferer to life.

Domestic Economy.

A Rich Ginger Cake.—Two cups of molasses, one cup of butter, two cups of flour, a few currants, a large table-spoonful of ginger, one tea-spoonful of saleratus. Bake half an hour. M. O.

Cement to Resist Fire and Water.—Half a pint of new milk, and half a pint of good vinegar. Stir them together until the milk coagulates; remove the curd, and mix with the whey the whites of five eggs well beaten up; when these are well mixed, add sifted quick-lime, until the whole is about as thick as putty. If this mixture be carefully applied, and properly dried, it will firmly join what is broken, or fill up cracks of any kind, and will resist fire and water.

Scotch Cake.—Stir to cream a pound of sugar and three-quarters of a pound of butter—put in the juice and grated rind of a lemon, and a wine-glass of brandy. Separate the whites and yolks of nine eggs, beat them to a froth, and stir them into the cake—then add a pound of sifted flour, and just before it is put in the cake pans, a pound of seeded raisins.

Fruit Creams.—Take half an ounce of isinglass dissolved in a little water, then put one pint of good cream, sweetened to the taste; boil it; when nearly cold, lay some apricot or raspberry jam on the bottom of a glass dish, and pour it over. This is most excellent.

Cheese Pudding.—To make a cheese pudding, grate half a pound of cheese, and add to it two ounces of butter, and four beaten eggs. Butter a dish, put the mixture in, and bake it twenty minutes.

Glasses may be washed either in warm or cold water, but either should be quite clean; they dry more easily from the warm, but have rather better polish if well dried from cold water.

Educational.

FLIGHT OF TIME.

BY H. S. E'CALL, ESQ.

How swiftly speed the flying hours
That cheer our early day,
They come and go: our human hand
Can bid them longer stay.
It seems but yester's rising sun,
We used to con the page,
And now another year has fled
With the departed age.

We hither come the treasured lore
Of ages past to find,
And from its varied valued worth,
To store the eager mind.
Nor have our labors been in vain,
The wisdom of the past
To garner in the beating heart,
That shall forever last.

CHANGING SCHOOL BOOKS.

The practice of changing very many of our text books in school, without some stringent necessity therefor, is one of the worst evils attendant upon our Common Schools. There are various causes which tend to bring about these changes, some of which act independently of each other, and others in concert; among which may be reckoned the following:

One teacher resigns his place, or is dismissed, and another succeeds him who has been educated in another locality, and is familiar with another class of text books; and it is inconvenient for *him* to change. So the scholars are directed to procure other and to them new books, containing the same principles it is true, but with those principles, differently explained, and with different forms of expression. Again, a publisher desires to introduce his series of publications in the place of others then in use, and therefore he proposes to exchange his new for the scholars' old books, even handed; well knowing that if he can manage to retain the use of that new series for a reasonable length of time, he will be reimbursed for the outlay in the profit of subsequent sales. Again, Boards of Education change; the incoming members being, it may be, of a different and antagonistic political faith; and zealous to show their superior wisdom over their predecessors and earnestness in the good cause of popular education, they set about pitching out of the windows forthwith the paraphernalia of the school room as heretofore existing, and introducing in its stead, new orders, new rules, new desks, new books, and perhaps new teachers.

The consequence is, the pupils are compelled to abandon the beaten path with which their feet have become familiar, and tread upon (to them) unknown ground. The essential elements of the study are identical, it is true, but the rules and explanations appear to them like strangers, and require long subsequent acquaintance to become in any degree pleasing. Old forms of expression, which convey to the learner's mind an intricate process, must be buried in oblivion if possible, in order to make room for its brother of a later date; but in spite of the effort, the old rule, like Banquo's ghost, will not "down at his bidding."

We appeal to the recollections of every reader if the above is not true. When a new Grammar or a new Arithmetic has been introduced, and students are required to guide themselves thereby, what a jargon is usually made of the new rules mixed up with the old.—There are some books which the changes in human progress require also, to be changed, or at least new and recent editions of the same to be procured. Geography is one of these. The frequent variations made in political divisions of the earth's surface, the rapid development of some nations, and the decadence of others, the increase of population in old cities and the founding of new ones, the change of territories into States, colonies into nations, empires into republics, and republics into empires, with a thousand other matters of similar character, conspire to render a Geography antiquated in a year or two at most. A single glance at any old map hanging smoke-dried and dusty upon the wall, is sufficient proof of this position.—Reading books ought also occasionally to be changed. There is no more propriety in keeping a boy reading a couple of years through and through the same two hundred pages of reading matter, than there would be in feeding a healthy man on codfish and potatoes—and nothing else—for two hundred consecutive meals. In Grammar, however, or Arithmetic, or any other fixed science, how much better are the thousand and one treatises which were published yesterday, and will be thrown into the corner and forgotten to-morrow, than those in use ten years ago at least?

College Commencement.—The commencement at Dartmouth College will take place on the 25th, 26th, and 27th days of July. The orators for the occasion, are President Hitchcock, of Amherst College, before the Theological Society; and Professor Shedd, of Andover, before the Phi Beta Kappa. J. T. Fields, of Boston, will recite a poem before the Phi Beta Kappa.

The Essayist.

[For the Rural New-Yorker.]

REAL PROGRESS, GRADUAL AND FROM WITHIN.

The individual who should for any limited period of his early life, address himself to the separate and independent task of building up for himself a character, fitted to conduct him honorably and triumphantly through any and every emergency he might be called to confront, unless very easily satisfied, would be likely on assuming his place in society, to experience some degree of disappointment at the result of his undertaking—would awake to a sense of the poverty of his attainment, compared with the wealth and brilliancy of his expectation. Not that he would necessarily prove recreant in practice to the convictions of truth and justice, adopted during his *noviciate*, nor fail in any signal instance to act in, at least, outward conformity with rules he had prescribed for himself; but, it can scarcely be doubted that he would find it far more difficult to maintain his ideal standard of rectitude, than he imagined when conning over systems of morals and philosophy in his study. The fact that so many fall from the lofty determinations with which they commenced life is, I think, abundant evidence of the truth of this presumption. For nothing is more common than to see youths of high and noble resolves—of generous and disinterested impulses when fresh from liberalizing studies, and the frequent contemplation of the most illustrous examples of virtue and heroism, finally degenerate into cold, selfish, calculating men of the world. Youth has often been characterized as the season of most generous self-forgetfulness—of most ardent, heroic devotion to principle; and I do not now pretend to account for the above-mentioned decline, otherwise than by suggesting that the superior freedom from care, which constitutes a condition of that period of life is peculiarly favorable to the expression of these admirable qualities, and that the necessity of providing for ones-self, and one's own household, almost inevitably causes, in manhood, some abatement of early enthusiasm.

Once fairly launched on the sea of active life, by comparing himself with what he hoped to be, man learns his deficiencies, and in endeavoring to repair them, experience soon teaches him he must be content to grow slowly. It has been so ordained, that while the descent to ruin is swift and facile, after one has entered on the downward way, progress toward perfection should be slow and difficult. Great and valuable results are obtained only after long and arduous efforts. The sun does not mount from the horizon to the zenith in a moment, nor does the mighty oak attain its majestic proportions in a day. Mushrooms, indeed, spring up in a night, and are like feeble and ephemeral. So, sudden, violent changes, extravagant resolutions formed in the hour of unhealthy excitement, too often prove mere spasmodic attempts at reform, and are sometimes followed by a more than philosophical reaction; not necessarily, because the resolver has suddenly become indifferent to excellence, but, perhaps because if an honest soul and faithful to the duty of self-examination, he finds that he undertook more than he was able to perform at once, and is overwhelmed and disheartened by the discovery of the vast disproportion between his feeble strength and the magnitude of the object sought. Indeed, to some natures it is, may be, more disadvantageous to have formed even moderate resolutions of amendment, and then broken them than not to have made them at all, inasmuch as such failure tends to weaken self-confidence, and if often repeated, induces many times a reckless despondency not easily shaken off.

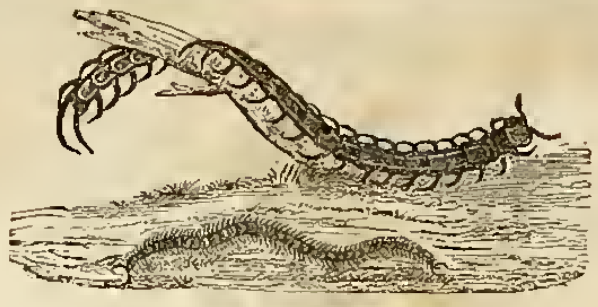
Equally unfortunate is that class whose mental vision is obscured by passion or by material interest—who fail to give the weight of their personal example, or to enlist actively in favor of any projected reform, through alleged inability to see *quite* clearly, that their duty lies in that direction. It profits a man nothing in a spiritual sense to be *almost persuaded* to rid himself of whatever vicious habits may have fastened upon him; on the other hand it costs him nothing pecuniarily to be *almost persuaded*, to abandon a pernicious though lucrative traffic. Only that full conviction, which is succeeded by reformation, is of any value to the individual, or to society. Cautious men feel that they cannot afford, and will not be expected, to set aside prudential considerations for half-convictions of duty; thus, they are careful never to be *quite* determined to give up a business which has been, and promises yet to be, advantageous, except for something equally, or still more profitable; but their fancied want of entire satisfaction, as to the beneficence of any proposed change, quiets their consciences, and they perhaps think to gain the reputation of well-meaning persons, by their professed willingness to make any personal sacrifice, if they were only *certain* the well-being of humanity would be promoted thereby. Their excuse is somewhat like that of the urchin who, after having been repeatedly called by his grandmother, at length slowly approached the house where he was accosted with—"Peter, why didn't you come in when I called you? didn't you hear me?" "I didn't but *j-e-s-t* hear, grandma."

It is impossible to estimate how much we owe to the demand made of us by others.—The ambition to equal, or exceed what is required of us—the fear of falling below expectation, are strong incentives to improvement, especially to the intellectual man. Thus, if an individual be in company that does not demand of him the best of which he is capable, any advancement he may make there must be independent of outward circumstances. If the writer feel so secure of his public that their judgment constitutes no incitement to him to do his *possible*, unless there be within him that will not be satisfied with anything less than the best he can do, regard for his literary progress will move him to seek a more critical audience. The practice many ordinary clergymen have of changing locations frequently, must be attended with one great disadvantage to themselves, however it may be to their hearers, namely: taking away a powerful motive to self-culture—the necessity of keeping pace with the increasing growth of a constantly advancing society. Let a man feel that nothing new is demanded of him—that he can sell what ideas he has garnered to one people, and still make use of them in the same shape in which they were first presented, as capital for another similar transaction, and he will not be likely to seek so earnestly for new ideas, or new forms, for old ones, as if his teachings were all directed to the same people.

Yet man's highest excellence consists not in what he is from outward demand, but in what he is from inward impulse, or necessity. The search for love and practice of Truth, for its own sake, is the only evidence of truthfulness. Deeds performed without regard to what others may say or think of them, but from an earnest sense of their essential fitness are alone originally and intrinsically good, though others indeed may be attended by beneficial results. Words uttered with no other care than that they shall convey faithfully, the individual sense of the speaker, however diverse it may be from the general sentiment and modified from that of all others, as the genuine opinion of any person must be by the peculiarities of his mental organism, and of the circumstances under which it was formed, are true indication of vigorous and independent intellectual life within—are a cheering sign of that increase of *being* which the transcendentalists especially say the world so much needs. A.

South Livonia, N. Y., 1854.

First Use of Gas.—In the year 1792, Mr. Murdoch made use of gas in his house and office at Redruth, Cornwall, England, where he then resided. The mines at which he worked being some miles from his house, he was in the constant habit of filling a bladder with coal gas, in the neck of which he fixed a metallic tube, with a small orifice, through which the gas issued; this being ignited, served as a lantern to light his way for the considerable distance he had nightly to travel. This mode of illumination being generally unknown, it was thought by common people that magical art alone could produce such an effect, and the discoverer actually ran some risk of personal inconvenience.



THE CENTIPEDE.

This name is of Latin derivation, from *centum* a hundred, and *pes* a foot; and is applied in popular language to various kinds of worms having a multitude of feet. Among those familiar to our readers, is the common Earwig, living around out buildings, and damp, decaying wood, such as old pumps, plank walks, &c. It frequently finds its way into the cellar, kitchen, and other places, which ought to be, if they are not, dedicated to domestic comfort and neatness, where they are speedily disposed of by the first person who happens to observe them. Every man, woman and child looks upon it as a common enemy, and kills it forthwith. It is said to be very poisonous, although instances of such effects have rarely been experienced.

Another worm which receives this name, lives in the woods and forests, around old stumps and logs. Its body is streaked with reddish colored rings, and when dislodged from its place of concealment, coils itself up with its feet inward. This species has a much larger number of feet than the one above named, and should properly be called a *Milleped*.

Among the various classes which receive this name, the genus *Scolopendra* includes large and venomous species, attaining not unfrequently, in tropical climates, a length of six inches or more. With the Scorpion and the Tarantula, they are in those regions the dread and the scourge of the human race. An exchange paper says of them:

"The deadliest and most abhorred of all the reptiles in Texas, is the Centipede. This is a kind of worm three to six inches long, exactly like an enormous caterpillar; it is green, or brown, or yellow, some being found of each three colors. As its name denotes, it has along each side a row of feet—horn claws rather. Imagine that you walk some night across your chamber floor with naked feet; you put your foot into a ring, striking every claw up to the body in your foot; the poison flows through each claw, and in two minutes you will have fainted in agony; in a few more you will be dead. The deadly thing cannot be torn away. It has to be cut off, and claw by claw cut out. Even if it crawls over the naked body of a sleeping person, without sticking in its claws, the place will pain the person for years after, at least so we have been told."

The above is perhaps somewhat of an exaggerated statement, but the general facts are true. We sometimes complain of the cold weather and frosts of our climate, but the protection they afford us against the inroads of these hateful and poisonous varieties of animal life, are blessings beyond all our powers of calculation.

Sunday Reading.

WHILE 'TIS DAYTIME LET US WORK.

Every mortal has his mission
In this world of active strife,
Whether in a high position
Or a lowly walk of life.

He it is, who now fulfilling
Every duty day by day,
Shows the mind and spirit willing
To perform its onward way.

Life's a bark upon the ocean,
Tossed and rocked by every gale;
Now scuds on with speedy motion,
Now with rent and tattered sail.

Life's a bright and sunny morning,
With some light refreshing showers
Followed by dark cloudy warning
Of the storm that o'er us lowers.

Life's the chord of silver, binding
Man in contact with his kind,
Death is but the bond unwinding,
Setting free the earth-bound mind.

Life's the pitcher of the fountain
Where immortal rills descend;
'Tis the fragile wheel surmounting
Cistern where pure waters blend.

Life's the day for deed and action
Death's the rest, the time of night;
He who works with satisfaction
Works while yet the hour is light.

Forward then? the day is waning,
Westward sinks the setting sun!
Onward! out! without complaining,
Work, while yet it may be done.

[Written for Moore's Rural New-Yorker.]

LIFE—ITS REALITIES.

BY MARY J. CROSMAN.

"Visions of earth! that once did visit me,
Making night glorious with your smile,
Where are ye?"

On Life! thou art a strange mingling together of the known and the unknown, the real and the ideal, the beautiful, the terrible and the stern.

'Twas evening; a mother gazed upon her infant child, while her heart overflowed with love, hope, and happiness. The little sleeper was a boy of uncommon promise; already his maturing mind, in its beamings forth, gave proud tokens of what lay within. His step was light and free, his laugh joyous, and his heart untouched by the blight of care or sorrow; and in the beauty, the purity of childhood, he was the light of a happy household.

But time, in its passing, brought an evening to a longer day, than when tired nature sought sweet repose. A little sufferer was lying on his couch; grief-stricken parents and anxious friends were moving noiselessly about, each seeking to relieve; but their ministerings are in vain; for there is a time when earthly ties must be loosed—heart-strings severed, and dear eyes closed.

The unfolding bud was kindly taken by our Father from the chilling blasts of earth, to blossom amid kindred flowers, in a more congenial clime; and though parental tears fell fast, and dark heavy waves of sorrow broke o'er the soul, yet a "still small voice" calmed at length the agitated waters, and brought a truer joy than they who worship at an earthly shrine can taste.

Happy, brief sojourner! thou didst tarry with us but to taste the sweeter draughts within life's cup,—hast departed ere thine eye was dimmed with the tear of bitter agony,—*thine* is the crown without the conflict; and neither darkness nor doubt are about thine upward pathway, "for of such is the kingdom of Heaven."

Wearily the night-hours wore on, and the morrow's sunlight awakened the din, the hurrying to and fro of human life. Mourning friends gathered round a little coffin, and took the last look of earthly love. The "Man of God" read from the book of books, "It is better to go to the house of mourning than to the house of feasting, for this is the end of all that live."

Humanity, fallen and degenerate though it may be, brightens our pilgrimage below, and strengthens the ties that bind us thither; and when, as in childhood, the spirit is undimmed from contact with a cold and selfish world, darker, lonelier, seems the way when the light of that spirit is withdrawn.

Within the halls of learning, I met one whose step wearied not in the race—whose motto was, "ever onward." Entering the broad domain of Science, he had gathered a rich harvest from her glittering coasts; but his desires were unsatisfied, his ambition unbounded; and amid the toil, naught was too intricate, naught too deep for the searchings of his intellect. Nor was the culture of the soul forgotten: his aspirations were sanctified, and his heaven-born powers offered at the shrine of holiness. High and noble were the emotions that swayed his will, true and generous his motive-power to action. His presence brought pleasure, and the music of his voice lightened our toil, and lent new charms to our pursuits. But too eager, too strong and unyielding for this mortal part, were his longings for wisdom; the mental overcame the corporeal; the tireless reachings of the one, overtasked the powers of the *other*. The citadel of Reason was besieged, its watch-guards overthrown, and Genius laid low.

Oh! what a noble heart was here undone,
When Science self destroyed her favorite son!
Yes! she too much indulged thy fond pursuit,
She sowed the seeds, but death has reaped the fruit.

And who shall tell the anguish of another heart, whose pathways otherwise had met in after years;—or count its weary hours after the light of hope went out: but yet must live on, though the bleeding spirit would fain be at rest—would dwell where flow those living streams from which none thirst again; would pluck from the "tree of life" those leaves which are for the healing of earth's weary ones? Yet, faint not, lone one, nor falter amid life's labors, for though the "rivers run high, they shall not overflow thee."

In his ancestral home was seated an aged man, whose thoughts were specially retracing those paths which lead to the olden times.—Without the storm-gods were angrily warring, but within their wagings were unfelt; and the dimly-burning lamp, the hour of the dial-plate, told that time passed unnoted by the old man. The spirits of departed hours were his guests, and their tread amid the silent chambers of his soul, echoed a charming cadence to the music of other days. The stream of time flowed on in retrospect, and its gentle murmurings awoke memories that slumbered beneath the weight of years. Again the friends of youth were about him: life's future glittered with the same golden prospects that it erst had done—its present was bright with the reflected light of ideal joys. Impatient were that youthful band, to act in the great drama of human scenes a higher part.

"Ah! the young and strong, who cherished
Noble longings for the strife,
By the wayside fell and perished,
Weary with the march of life."

Further on was a happy household band—but the scene grew dark, for of them who together had thought to tread life's path, "the one was taken, and the other left."

Awhile, and a little heart whose pulsations hitherto had been but to love and happiness, paused for that shielding care, and gathering up its spirit-wings, sped upward to the "mansions of the blest." But weary not by the way, lone one, for twofold is the chain that henceforth binds thy soul to heaven;—and contact with earth's corroding cares, shall but give it strength and radiant brightness. *Thy* summons soon will come, for man's days are as the passage of a swift ship, or a weaver's shuttle.

The lights and shadows chased each other on, until the present was reached, where sat an aged man, whose footsteps were about to enter that dim pathway, leading from seventy years to eighty: who had found that the life-giving visions of the ideal, are not always true types of the real.

Pain and pleasure, good and evil, come to us from unexpected sources. It is not there, where we have gathered up our brightest hopes, that the alarm of happiness breaks. It is not there, where we have glanced our eye with affright, that we find the deadliest gloom. What should this teach us? To bow to the great and only source of light and life humbly, and with confiding resignation.

A firm faith is the best divinity; a good life is the best philosophy; a clear conscience the best law; honesty the best policy; and temperance the best physic.

Miscellaneous.

[Written for the Rural New-Yorker.]

MAY.

BY ELIZABETH J. EAMES.

I

Delicate and dainty daughter,
Darling of the spring;
Hill and valley, wood and water,
Welcome to thee bring—
Child of Beauty, thy sweet duty,
Through the summer hours,
Is to scatter buds and blossoms
Through the earth's green bowers.

II

Welcome, fairy-footed creature—
Child of sun and dew,
Favorite of man and nature,
Crowned with violets blue.
Merry maiden, richly laden
With all gifts of spring,
From thy rosy-veined fingers
Treasures dost thou fling.

WHERE ARE THEY NOW?

It is a melancholy, although a profitable employment, for an individual who has reached the meridian of life to take a retrospect of the past, and trace the career of those who set out with him in the beginning, upon the probationary journey. Not only those who started with him, but those also whom he has overtaken and passed, or who have overtaken and passed him upon the dusty highway, will afford many a lesson of instruction. If he could only place these lessons before the young and rising generation, and they would heed the admonition, it would enable them to steer clear of rocks and shoals that have shipwrecked many a gallant bark, which started under favorable auspices upon the voyage over life's solemn sea.

The man who has struggled with adversity and made the most of his opportunities under the favor of Providence, will find himself far above innumerable acquaintances who looked down upon him originally, and whose positions, it may be, he regarded somewhat enviously in early life. The bright young lad so petted by his parents, and looked up to by his fellows; whose father was wealthy and mother proud and indulgent; who had pocket money in abundance, and toys in superfluity; who was generous to a fault, but at the same time, and from the very nature of the case, supercilious, willful, and passionate; who had every possible facility afforded him to rise, but who neglected them all, in the pursuit of pleasure; what has become of him? He is dead! Died a drunkard, degraded and fallen; his wife broken-hearted, and his own boy a beggar.

Where is the black-eyed and proud young beauty who stole the heart of the poor bashful lad, and then turned away from her humble admirer in disdain, to take up with a more flashy lover? She is now a foiled and dispirited woman, with an unkind husband and a family of children, just barely above the point of absolute want, and retained even in that position more by the labors and sleepless energies of the mother, than of the father. He made a figure for a time, and lavished more on external show than internal comfort; without the means to live in fine style, but struggling to do so, he put on at the expense of all his income and more, a thin varnish of fashionable life, just sufficient to obtain the sneers of the wealthy and the contempt of the poor. He was too proud to saw his own wood, hoe in his own garden, or go into the street with an ungloved hand, and as his family increased, and sickness visited them, rents went up and provisions rose in the market, the struggle grew more intense, until it could be kept up no longer. The habit of false appearances, however, had become fixed, and the whole after life of that proud beauty, and her foolish and vain husband, has been a mockery and a lie. Does she ever reflect that she might have married the poor boy who, since that time, has struggled up slowly but surely to a position of wealth and respectability?

What has become of the ragged little urchin who sat upon a low seat in one corner of the school room, and studied his lessons in the cast-away books of the other scholars; who went to school barefooted, even in cold weather, and was reproached by thoughtless boys, for his uncouth and dilapidated garments?—Poor boy! he had a heart to feel as well as the rest of us; and he would have laid down his life to have been loved and cherished as he deserved, and he resolved to show those ungenerous play-fellows that he was at least their equal in mind and soul. He saved one of his worst tormentors from a watery grave, while bathing in the mill-pond; and he threw a little girl over a fence to put her out of the way of an infuriated bull, and then stood by her like a hero, until the danger was over. He is now above the scorn and reproach of all his school fellows, and has become the envy of those very men who, as boys, were mean enough to despise him.

That young man who lived in the family of a proud uncle, and did chores for his board while attending the academy—his cousins barely tolerated his presence, because he took the drudgery off their shoulders, and his aunt kept him on sufferance because he did morning and evening, the day labor of a man; what has become of him? He is known to fame as an extensive publisher and literary man, and his uncle's family are now very proud to acknowledge the relationship.

And so it is throughout the whole wide range. Some of the brightest and most promising are in their graves; this one a grave of buried hopes and blighted prospects, and that one the resting place of all that was mortal of an angel in heaven. This one his own destroyer, and that one called home early by the voice of the Good Shepherd. Some who were the least promising are now highest in the social scale; all of those surviving are scattered and dispersed over the broad field of life, in circumstances as varied as the character of the individuals. But the rule is universal, that those who have acted wisely, energetically, and uprightly, have invariably continued to rise; while those who have acted foolishly and criminally, no matter how bright were their original prospects, have lost ground on the world's great stage. "I have been young but now I am old, yet never have I seen the righteous forsaken, or his seed begging bread."

DESULTORY PARAGRAPHS.

[Continued from page 129, this volume.]

XXIX.

Flickering Fancies.—We sometimes have strange and dreamy fancies—fancies we forget as soon as they come, they are so *flickering*. They are as evanescent and variable (to pursue the idea,) as the figures which, in some moods of mind, we may trace in the blaze and coals of a winter's fire. Our thoughts are busy with the past, they wander far into childhood, but ever and anon among the brightest memories come up the darkest—as when gazing into the embers we see bright gems, golden flowers, and smiling faces, and also writhing serpents, mocking fiends, and leering demons, which startle us with horror, and make us look away. They send us back, and wisely perhaps, to what surrounds and concerns us now.

XXX.

Self-Importance.—People who are jealous or particularly careful of their own rights and dignity, always find enough of those who do not care for either, to keep them continually uncomfortable.

XXXI.

Qualities of a Poet.—Simplicity and comprehensiveness are the most desirable qualities in a writer. "*To carry on the feelings of childhood into the powers of manhood,*" says Coleridge, "to combine the child's sense of wonder and novelty with the appearances which every day, for perhaps forty years, has rendered familiar,

With sun and moon and stars throughout the year,
And man and woman—

this is the character and privilege of genius, and one of the marks which distinguish genius from talent." Those who may keep these fresh feelings and unsullied through life, have not only the best source of poetry, but of happiness, welling up in their hearts, a never failing fount of beauty and blessing.

XXXII.

The Unsuspecting Heart.—Open-heartedness may perhaps go too far—you may give your confidence to those who fail to appreciate it—yet, who would not rather be chilled sometimes by the coldness of others, than ever spread the influence of an iceberg around themselves? Is not one who is ever on the lookout for deceit, more likely to detect unhappinesses which would not otherwise be encountered—which an unsuspecting heart would never have imagined, much less have met with? Are not they the happiest who say with the poet—

"I cannot spare the luxury of believing
That all things beautiful are what they seem?"

XXXIII.

Prejudice seldom Acknowledged.—None are too wise to be mistaken, but few are so wisely just as to acknowledge and correct their mistakes—and especially the mistakes of prejudice.

XXXIV.

Opinion Giving.—Though truth will serve our turn better than falsehood on *all* occasions, it is a hard matter oftentimes to give one's sincere opinion, especially when it cannot fail to wound the vanity of the questioner, whom you would rather conciliate. Besides, we really have no opinion on many subjects thus brought before us, and yet would not wish to own that we have given them no thought or attention. One needs readiness of thought and fluency of expression to pass gracefully through such emergencies.

XXXV.

The Worth of Work.—Work is worth, if rightly directed; unwrought iron can, by labor, be given form and value beyond its weight in gold. Work is beauty when genius holds the tool. The rough block is then sculptured into forms fairer than life.

XXXVI.

The Law settles differences, leaving enemies, but the true peace-maker leaves those friends whom he decides between.—a.

THE SOAP STONE.

There is a fine quarry of this singular and useful material at Grafton, in the vicinity of Bellows Falls. The mill where it is prepared for use, and fitted for a finishing establishment in Boston, is at Cambridge, Vt., a small village near the line of Grafton. This quarry has long been known, as is seen from antiquated chimney pieces in the neighborhood, but was formerly worked upon a small scale, in part from the want of modern improvements in machinery, but chiefly from the expense of transportation to the distant market.

That obstacle is now removed by the railroad. The freestone, as it is here called, has the "unctious feel" of the mineralogist, and the cognomen *soap* better describes the striking resemblance to touch of that article, although the ease with which the material is cut and fitted for use makes the word *free* a proper and significant appellation. The spectator at first is both amused and surprised to see huge blocks of granite-looking stone cut into slabs by a saw such as he has seen in use only for wood.

The teeth are not so sharp at the point, but with this exception, one might think the workmen had borrowed from a saw-mill the well known instrument for transforming logs into lumber. The soap stone contains no substance harder than itself, and it cuts under the common saw easier and faster than hard wood of the same dimensions. This I proved by experiment on a cubic piece, a part of which I carried away as a specimen of the quarry.

The slabs are cut into various forms by circular saws, which, from their rapid motion seem not to perform a very hard service; and the facility of working the material is no inconsiderate item of its value. From the various uses to which the soap stone is adapted, it must soon find a greater demand. In the ordeal of heat, it seems to be cousin-german to *asbestos*, for it endures fire without warp or crack, even to a red or white heat, losing only now and then thin scales on the inner surface.

It is susceptible of a moderate polish, and is now fashioned into chimney pieces and ornamental work exposed to fire. Nay, more, it begins to take rank with household furniture, and is used for griddles, being found superior to iron, inasmuch as it needs not to be *greased* to give up the cakes, and does the work without the disagreeable odor arising from the same cooking upon iron. To what further and various uses the soap stone may be desired in this age of progress, I know not, but even this brief notice of so important a quarry in its incipient working, may not be without interest to the public.—*Cor. Jour. Commerce.*

KEEPING THE TEETH CLEAN.

Microscopical examinations had been made of the matter deposited on the teeth and gums of more than forty individuals, selected from all classes of society, in every variety of bodily condition, and in nearly every case animal and vegetable parasites in great numbers had been discovered. Of the animal parasites there were three or four species, and of the vegetable, one or two. In fact, the only persons whose mouths were found to be completely free from them, cleansed their teeth four times daily, using soap once. One or two of these individuals also passed a thread between the teeth to cleanse them more effectually. In all cases the number of the parasites was greater in proportion to the neglect of cleanliness; the effect of the application of various agents was also noticed. Tobacco juice and smoke did not impair their vitality in the least. The same was also true of the chlorine tooth-wash, of pulverized bark, of soda, ammonia, and various other popular detergents. The application of soap, however, appeared to destroy them instantly. We may hence infer that this is the best and most proper specific for cleansing the teeth. In all cases where it has been tried, it receives unqualified commendation.—It may also be proper to add, that none but the purest white soap, free from all discoloration, should be used.—*Germantown Tel.*

"Nutmegs."—"On our return to the ship we visited a nutmeg plantation. The trees, which are from twenty to thirty ft. in height are planted in rows, at intervals of about twenty feet. The leaf is dark, green and glossy, resembling that of the laurel, and the fruit, at a little distance, might be taken for a small russet-colored apple. When ripe, the thick husk splits in the centre, showing a scarlet net-work of mace, enveloping an inner nut, black as ebony, the kernel of which is the nutmeg of commerce.—The clove tree, not now in its bearing season, has some resemblance to the nutmeg, but the leaf is smaller and the foliage more loose and spreading. As we drove through the orchard, the warm air of noon was heavy with spice.—The rich odors exhaled from the trees penetrated the frame with a sensation of languid and voluptuous repose. Perfume became an appetite, and the senses were dragged with an overpowering feeling of luxury. Had I continued to indulge in it, I should ere long have realized the Sybarite's complaint of his crumpled rose-leaf."—*Bayard Taylor.*

Abernethy.—Of John Abernethy, one of the most eminent surgeons and medical writers of the last century, several anecdotes are recorded. He was extremely eccentric, or rather extremely manly. He acted and spoke always as nature dictated, and not as custom ordained. To a rich valetudinarian gentleman he once said, "Live on a sixpence a day and earn it," and to a lady of the same species who offered him a fee, he said, "Madame, keep your money and buy a skipping rope." When he loved, he still continued to despise the forms with which society ever seeks to encumber the sayings and doings of men. He did not waste his time courting, nor did he prostrate himself, as is usually the case, before the relatives of his Eve. He met her in the streets, revealed his affections for her, and offered her his hand. She accepted it, and he immediately gave her a purse, with orders to furnish a house.—*Gilfillan's Gallery of Literary Portraits.*

Ladies' Department.

CONDUCTED BY A——E.

TO A BELOVED ONE.

BY GERALD MASSEY.

Heaven hath its crown of stars, the earth
Her glory-robe of flowers—
The sea its gems—the grand old woods
Their songs and greening showers;
The birds have homes, where leaves and blooms
In beauty wreathe above;
High yearning hearts, their rainbow-dream—
And we, sweet! we have love.

We walk not with the jewell'd great,
Where Love's dear name is sold;
Yet have no wealth we would not give
For all their world of gold!
We revel not in corn and wine,
Yet have we from above
Manna divine, and we'll not pine;
Do we not live and love?

There's sorrow for the toiling poor,
On Misery's bosom nurst:
Rich robes for ragged souls, and crowns
For branded brows Cain-curst!
But Cherubim, with clasping wings,
Ever about us be,
And, happiest of God's happy things!
There's love for you and me.

Thy lips, that kiss till death, have turn'd
Life's water into wine;
The sweet life melting thro' thy looks,
Hath made my life divine.
All Love's dear promise hath been kept,
Since thou to me wert given;
A ladder for my soul to climb,
And summer up in Heaven.

I know, dear heart! that in our lot
May mingle tears and sorrow;
But, Love's rich rainbows built from tears
To-day, with smiles to-morrow.
The sunshine from our sky may die,
The greenness from life's tree,
But ever, 'mid the warring storm,
Thy nest shall shelter'd be.

I see thee! Ararat of my life,
Smiling the waves above!
Thou hail'st me victor in the strife,
And beacon'st me with love.
The world may never know, dear heart!
What I have found in thee;
But, tho' nought to the world, dear heart!
Thou'rt all the world to me.

[Written for the Rural New-Yorker.]

CHARLEY FERN'S REJOINDER.

The little paragraph which recently appeared in the Rural over my signature, seems to have excited peculiar emotions in certain quarters, owing perhaps to its having an unfortunate matrimonial squint. Pretty little missives, (missiles?) upon white golden-edged pinions, have been hurled at me by invisible hands, with such well directed aim, and accurately calculated force, that even a thorough-going vixen, or an incorrigible coquette, beholding my pitiable plight, would cry out, "Spare, friends, spare!" Indeed, they would fear that unless a short truce was granted, there would not be enough left for another basting. If I had even been an unconscionable old widower, or a scape-grace flirt, I should not have deserved such treatment. Why, for the first time in my life, I have been able to sympathize with Louis Napoleon's uncle in his retreat from Moscow. They fire upon me from all sides. Shade of Lucy Stone, protect me!

Just as I have turned my face to confront a division of Queen Victoria's Canadian Archeresses, a whiz rings in my ears, wheels me about to meet the attack of impetuous Southrons, in whose hearts a tropical sun has kindled scathing fires; and before I can reach a salamander safe, an East wind sets in, laden with darts, as of late with snow-flakes, which only shifts about to pour upon me a regular hail storm of epistles from the West. And while I stand confounded, terra firma begins to shake and crack right under me. And before I can say, What now? a great, swarthy hand flings a cute little thing, cunning as possible, right into my face, labeled, "Politeness of Uncle Tom, manager of the Underground R. R.,—from Eva."

It must be proof of the largeness of my heart, and the firmness of my nerves, that of more than six-score darts, mercilessly flung, every one has found a lodgment and cut a tender cord. Saddest of all, my surgeon declares that he would not hazard the extraction of one, and leaves me to live or die transfixed, as Cupid may decree. Yes, and he hints, too, that some of them may be poisoned.

By the way, who had the christening of the present generation of black eyed, *true* eyed, country lassies? Doffing my hat and bowing my head, I humbly asked, "Whose servant shall I be?" A dozen voices cried out "Kate's," a score "Katie's," a dozen or two "Kittie's."—And then there was such a clamor of Nellies, and Minnies, and Nannies, and Jennies, and Jessies, that my jaws went together so tight that I have not been able to speak a plain woman's name since.

Now, Kate and Kittie, Jessie and Jennie, *entre nous;* what can a poor fellow do? Some of you black-eyed girls slash away at a man's heart with your Damascus blades, like regular Turks. I wish I could send off a bevy of you to the Sultan to fight old Nicholas. Some ask such questions,—"Have you read the Governor's veto message? Horatio says you have no right to make a witness criminate himself." Others are inclined to play at fun-poking. I don't mean "Dame Prudence;" she has blind eyes—taking me for an old widower, wanting to make the contract styled "*Marriage de convenance.*" But one of the Kates lets at me more thrusts than Soule and son could both parry. Yet, it is "well done." The hemlock hills of Old Otselic are admirably represented.

Let us come right to Court,—not courting yet. I advertised for a wife. The advertising was simply telling what I wanted. Is there anything out of the way about that? I don't know the man who does not, or has not wanted that same. Girls I conclude want husbands, as most of them get them. Surely no one will pretend that, wanting a wife, there is any harm in saying so.

"Mr. Fern will please specify." Yes, Kate Prudence, he would just as soon as not, if there were any need of it. Just take a survey of men and women, and see how they are mated; and you are not a shrewd Yankee girl if you cannot guess my "personnelle." When I said a particular person would find a partner who would not fail to please, I could correctly be understood to refer but to *one*—or I am neither a Mohammedan nor a Mormon. Well now, Jessie G., I have no doubt there is one who would please thee. If you supposed that I expected to charm every country lass with black eyes, your wits were sadly at fault. There are thousands of Rural specimens with a dash of lamp-black in their "eyne," *one* of whom is enough for me—

"Enough for life's gloom, full enough for its cheer."

But it is all over with me now, and I am growing no better very fast.

Your suffering, sympathy-craving
Waterville, April, 1854. CHARLEY FERN.

[For Moore's Rural New-Yorker.]

PURSES RIGHTLY DISTRIBUTED.

In the few weeks past, I have noticed a diversity of sentiments expressed in the Rural, in regard to having two purses in the family. I herewith send you a few more ideas on the subject of purses rightly distributed.

I fully coincide with "One who Ought to Know," that the wife—especially the farmer's—should have a purse of her own, that she may draw from when it best suits her convenience. I would ask the husband, who fears some evil consequences will ensue from allowing his wife a purse of her own, if he has not often felt it to be a great annoyance to be asked for a shilling or two, or a dollar, to purchase something for the use of the family, and *perhaps*, replied not very amiably, "You are always wanting something; what now, I wonder; something useless, I dare say." Whereas, if she had the control of *something* whereby she might obtain money sufficient to procure useful articles, she would realize a degree of independence hitherto unknown, and he would feel much better contented with himself, far happier than when refusing his wife a few shillings for actual necessities, knowing that many things were secured in time to save, not only *labor*, but money, which had hitherto been neglected, for fear "husband would scold" if asked for the money.

By way of illustration, here is a sketch of purses rightly distributed. Mr. and Mrs. J. commence business on a farm; his father gives him "a start in the world," and then tells him to help himself, which he is very willing to do. Although he is considerably in debt, he feels no evil forebodings, knowing as he does, that he has selected a wife who will not make any unreasonable requests. To begin with, he gives her, for a sort of home "tariff," all the surplus butter, poultry and eggs, or whatever comes under her supervision, to make a purse for her own especial purpose. Now we shall see how competent she was to care for the trust thus given her. Mrs. J. was a school-teacher—most excellent wives they make—accustomed to calculation. She now, in her new sphere, begins to calculate how to increase the general fund, and also the general happiness. She marks well her income, (for she has a book containing many pencil marks,) and endeavors not to let her wants exceed her capabilities of payment; and in this way she has not only supplied the family with all the groceries, and "Yankee notions," but has nearly furnished all the dry goods for the family out of her own *purse*, during the five years which they have been in business. Perhaps I ought here to state, that Mr. J. never keeps more than two cows,—but they are of the best kind, and Mrs. J. knows how to make the golden butter, of which during the last year she has, at eighteen cents a pound, sold seventy dollars worth, besides supplying her own family.

No wonder Mr. J. is called a prosperous farmer! No wonder that he has more than doubled his property in five years; no wonder at all,—he selected a *sensible* woman for his wife, entrusted her with a *purse* of her own, and she has shown that a woman is not only capable of *contracting* debts, but of *paying* them also. I would here say, that Mrs. J. has all the "woman's rights" she desires, and thinks if *men* who have wives striving to go to the polls to vote, would treat them with the respect and deference which she receives from Mrs. J. they would have happier homes, and more devoted companions.

One who Does Know.

RURAL NEW-YORKER

ROCHESTER, MAY 20, 1854.

SPECIAL NOTICES.

☞ *A new quarter commenced April 8,—a good time for new single and club subscriptions to begin; and the renewal of expiring subscriptions is now in order.*

☞ *Additions to Clubs are still in order. If back numbers are not wanted, we will send from 1st March or April to end of year for $1—and count on premium.*

☞ *During the season of navigation we can send the Rural to Canada West free of American postage, and hence will furnish clubs for six months from date at lowest rates.*

☞ *Back numbers of the present volume furnished if desired, or subscriptions may commence at any time.*

Stirring Scenes in Congress.

The House of Representatives presented a scene of the most intense excitement, during the long session of Thursday and Friday of last week, no adjournment intervening for *thirty-five and a half* consecutive hours.

Seventeen bills having been laid aside in order to reach the Nebraska bill, a motion was made by Mr. Richardson, of Illinois, to terminate the debate on Monday, for the purpose of passing the measure through the Committee.—This motion was resisted by the opponents of the bill, (who are in the minority,) and various parliamentary expedients resorted to in order to stave off the vote. Motions in great numbers were made, on which the ayes and nays were demanded; such as motions to adjourn, motions to excuse from voting, motions of reconsideration, appeals from the decisions of the chair, &c., &c. The opposition divided themselves into platoons of 30 members each, two sets of which were constantly present, while the others were absent recruiting their exhausted energies, in order to continue the resistance.

The succeeding Tuesday had been specially fixed upon for the consideration of the Pacific Railroad bill, and the Anti-Nebraska members believed if the vote could be put off until that time, the Nebraska bill must go over, at least for a time; and they were determined, if necessary, to continue the session uninterruptedly until then.

At half-past eleven on Friday night Mr. Richardson gave notice that the friends of the bill yielded, and consented to adjourn over until Monday, which was accordingly done. No great degree of ill feeling was manifested during the long session, except that Edmundson, of Va., and Campbell, of Ohio, came near having a fight. The Sergeant-at-Arms, aided by several members, interfered and parted the belligerents.

It is altogether probable, although the final consummation may, and probably will be postponed for a brief time, that the Nebraska bill will pass, since nearly the entire South are in favor, and a large number of Northern members also, who are backed by the whole weight of the administration. Next in the catalogue after the passage of this bill, will perhaps be the question of annexing Cuba, involving possibly in the issue a war with Spain.

Exciting Foreign News.

The news from the seat of war is of a very decisive and important character, and shows clearly that the hostile armies and navies are not disposed to remain idle. Odessa, the most important Russian port upon the Black sea, and one from which the Western powers have been accustomed to draw immense supplies of grain, has been bombarded by the combined fleet, and a portion of the city laid in ruins. Several of the bombarding vessels suffered severely in the attack, and a detachment of British marines, 1,200 strong, in attempting to land were repulsed by the Russians.

The latter are reported as retreating from some of the Turkish provinces, pressed by the forces of Omar Pasha. A proclamation of the Czar has been issued, declaring the contest a holy war, and one waged by him in defence of the Orthodox faith, thus mingling a feeling of religious hatred with that of national hostility. As spring advances, greater activity will prevail throughout the hostile camps, and we may look for decisive actions with each successive arrival of news from the seat of war. A few such actions as that at Odessa, will serve to stimulate the already determined animosities of the belligerents, for the dogs of war are rendered more and more sanguinary with every succeeding conflict.

Democratic Convention.—The Democratic State Committee (Soft) have issued a call for a State Convention to be holden at Syracuse on the sixth of September, for the purpose of nominating a State ticket. The Convention is to consist of four Delegates from each Assembly District, making the large number of five hundred and twelve. The resolutions of the Committee endorse General Pierce's administration, and approve the Maine Law veto of Governor Seymour.

Railroad Disaster.—On Saturday last a train of cars on the Hudson River Road, overtook and ran into another train near Greenbush. The engine of the after train went half way through the passenger car, smashing it to pieces, injuring the conductor and every passenger in the car, but fortunately no person was killed. The trains ran within five minutes of each other from Troy, the latter being also the fastest train.—Such close proximity of time deserves severe censure.

New Yorkers Sold.

A person, calling himself an agent for three companies of *uniformed female militia*, lately made his appearance in New York, and announced that on Tuesday, the 9th inst., these three companies, under the evolutions of "The Fairy Light Guard," composed of highly respectable young ladies of New Jersey and Pennsylvania, would visit the city in military costume, parade in the Park accompanied by a band of music, then visit Barnum's Museum in the afternoon, and the Crystal Palace in the evening. The humbug agent made arrangements with the manager of the museum for a reduction on the price of admission, for the fair chivalry, and had conversation with several hotel keepers (among them the proprietors of the Astor,) in reference to a dinner.

Curiosity was on tiptoe in Gotham, and when the day came, the whole city and country round about turned out to see the parade. The Park, the adjoining streets, and the ferry landing from Jersey city, were blocked up by a dense mass of human beings assembled to witness the display. But no "Fairy Lights" made their appearance, and the disappointed New Yorkers finally returned to their homes and business, sadder and wiser men. They had been fairly sold, and the lesson they have learned, may compensate in part for the stale old trick they are in the habit of playing on strangers; viz., that a man for a wager is about to climb to the cross on Trinity spire. The head of Wall street has more than once been blocked up by the green ones, awaiting the arrival of the aforesaid man, who will probably make his appearance about the time the "Fairy Light Guard" visit Barnum's Museum.

A Speck of War.

Contrary to previous reports, it now appears that the Spanish Government refuses to comply with the demands of Mr. Soule, our minister to that court, in regard to the affair of the Black Warrior; and the *Washington Union* recommends an immediate blockade of Cuba, in case of persistence in the refusal.

The *Union* is the ostensible organ of the administration, and is usually supposed to express its sentiments, although it does not always do so. It is to be hoped, that in the matter of the *Black Warrior*, and other unadjusted questions between the two Governments, a pacific and satisfactory arrangement will be made, as in case of hostile demonstrations just at this juncture, the United States might lay themselves open to the imputation of seeking a rupture just at the moment when England and France are otherwise engaged. Let justice and moderation rule the councils of our own and the Spanish Government, and all difficulties can be amicably adjusted without either blockade or filibustration

Religious Anniversaries.—The various Religious and Philanthropic Societies held their annual meetings in New York city, during the past week, and were largely attended, from all parts of the country. Most of them are in prosperous circumstances, and in their various fields of labor have done, and are doing, an incalculable amount of good. Large sums of money have been received and disbursed by them, and it is hoped their energies will not be crippled during the coming year, for want of the means necessary to carry forward the good works.

Forrest vs. Willis.—It will be recollected that personal difficulties and animosities have for a long time existed between Edwin Forrest, the tragedian, and N. P. Willis, one of the editors of the *Home Journal*. Several suits at law have been instituted between them, the last of which was a libel case, (damages laid at $20,000,) Forrest being plaintiff. The cause was tried last week, and resulted in a disagreement of the jury, the differences in opinion as to the amount of damages, ranging, it is stated, between *ten thousand dollars and six cents!*

Sufferings of Col. Fremont's Party.

The following extract from a letter to the editor of the *Salt Lake News*, contains a brief statement of the sufferings of Col. Fremont and his party, while engaged in a winter reconnoisance of the central route for a Pacific Railroad:

On the 6th of February, the man on the lookout at Parowan reported a company, supposed to be Indians, coming into the north end of the valley, twenty miles distant from Parowan, and about 11 o'clock on the morning of the 7th, Col. Fremont, with nine white men and twelve Delaware Indians, arrived in Parowan in a state of starration; one of his men had fallen dead from his horse the day previous, and several more must inevitably have shared his fate had they not had succor that day. They reported that they had eaten twenty-seven broken down animals; that when a horse or mule could go no further, it was killed and divided out, giving one-half to the Delawares, and the other to the Colonel and his men; the hide was cut in pieces and cast lots for. After the bones had been made into soup, they were burned and carried along by the men for luncheon. The entrails were shaken, and then made into soup, together with the feet and eyes; thus using up the whole mule. They stated that they had traveled forty-five days living on this kind of fare.

Served him Right.—The New Orleans Delta tells a story of a man in that city, who being about to enter upon a doubtful speculation, disposed of all his real estate, and deposited the proceeds thereof in the Bank, in the name of his wife, that the money might be beyond the reach of creditors, should his speculation prove unprofitable. The wife, finding herself the sudden possessor of wealth, in her own right, ran away to Havana with a good looking masculine friend, leaving her loving spouse to consider, at his leisure, the truth of the old adage.

Congressional.

Washington, May 8.—In Senate—The Chair laid before the Senate a statement from the Secretary of the Treasury, in reply to the resolution as to the amount of stock and other government securities redeemed since March 3d, 1853. The whole amount redeemed since that date is $18,8t3,814 75. The premium paid on the same, $2,657,902 93, having outstanding liabilities to the amount of $50,313,872 52.

A motion of Mr. Gwin's, to take up the Pacific Railroad bill was lost—13 to 23.

The Homestead bill then came up as the special order, but was postponed until Tuesday of next week.

House—The House reached the Nebraska bill after laying aside 17 bills that had precedence. A vote was taken on each bill—Ayes 100, Nays 20 or 30. When the Nebraska bill came along, the House was the scene of no little tumult.—Members were on their feet, and clapping of hands was heard in all parts of the Hall. A motion to lay on the table was defeated by a vote of 85 to 105.

Gerrit Smith, of New York, and Breckenridge, of Ky., were appointed tellers. Some of the members hitherto opposed to the bill, now voted for taking it up.

May 9.—Senate—Nothing essential done.

House—The House was in committee of the Nebraska bill until 10 o'clock, P. M.

May 10.—Senate—Mr. Morton, from the Agricultural Committee, to which was referred the Maryland resolution, relating to the British monopoly of guano, reported a resolution referring the resolution to the President. Carried.

House—Mr. Richardson notified the House that he would, to-morrow morning, move to terminate the debate on the Nebraska bill—the time for which would depend on the opponents of the bill. If they choose to go on and debate it, he was disposed to allow them until Monday, when the Pacific Railroad will be the special order. The House then went into committee on the Nebraska bill.

May 11.—Senate—No business of importance done.

House in Committee on the Nebraska bill.—Great excitement prevailed, the question being on terminating the debate.

The House remained in session all night, and all day Friday, up to 11½ o'clock, P. M., at which time the friends of the bill yielded and the House adjourned over until Monday.

Transit at the Isthmus.—The Panama Railroad Company has received the following advices, dated Aspinwall, 30th April, from the Company's agent:

"We still expect to reach the summit with the track, in all the month of May. The track is now over the upper Obispo bridge. By the next run of steamers we shall carry the passengers as far as the crossing of the Gorgona road, which is 3½ miles above the present terminus at Obispo; and by the next run, that is, one month from this time, we shall be at the summit.

"The forces are now spread two miles beyond the summit, while the Chinamen are coming on rapidly from Panama."

The First Fruit of War.—A letter from the Rev. Wm. G. Shauffler, of Constantinople, draws a melancholy picture of the distress which the Eastern war has already occasioned among the poorer classes of Constantinople. He says that there is no commerce, no business going on, but little money to be seen, and thousands of human beings are dying of hunger, thirst, nakedness and disease. Rats and mice are eaten by many to allay the cravings of hunger, and people who but a few months since were comparatively rich in worldly goods, now beg for bread. Mr. Shauffler states, that although he has resided twenty years in Constantinople, through all the horrors of war, plague, famine and fire, he never saw such distress as now exists.

Massachusetts Tax.—Of the State Tax of $200,000 ordered by the late Legislature to be assessed upon the different towns and cities of the Commonwealth of Massachusetts, Boston pays $118,691; Lowell $8,601. There are the largest sums paid by the cities. Lowell pays more than the counties of Franklin, Hampshire, Barnstable, Nantucket, or Dukes. More than one-half of the whole tax is paid by the thirteen cities of the Commonwealth. The two smallest sums are those paid by the "rural districts" of Boston Corner in Berkshire 9 cents and Monroe in Franklin, 36 cents.—*Boston paper*

Movements of Matt. Ward.—We have already noticed the arrival of Matt. Ward and brother at Connelton, Ind. They had been in the town but a short time, before, as we learn from the Hawesville Eagle, a committee of citizens waited upon them and desired them to leave the place. Thereupon they went to Judge Huntington's, some distance in the country, and afterwards took passage on the Eclipse for Arkansas.—When the steamer reached Henderson, a large crowd collected on the wharf and ordered the Captain to be off with his boat and cargo. The Eclipse passed Paducha Thursday.—*Louisville Courier.*

Accident at Niagara.—Several days since a wagon and two horses slipped over the bank of the Niagara river, at the rear of the Clifton House, near the falls, and were precipitated a distance of one hundred and fifty feet, to a projection, about two-thirds down the precipice, where they lodged. Singular to relate, one of the horses escaped without serious injury, while the other was killed. The wagon was uninjured with the exception of a broken axletree. The living horse was with some difficulty lowered to a raft beneath, by means of ropes, and towed thence safely to the landing place.

Mail Transportation.—The extent of the transportation of United States mails by Railroad has very largely increased within a few years past. Instead of 4,327,400 miles, as in the fiscal year 1847-8, the transportation of mails by Railroad last year, was no less than 12,986,705 miles. The changes are observable mostly in New York, Ohio and Michigan; the former having increased from 135,076 miles in 1847-8 to 3,009,958 in the year 1852-3; in Michigan from 147,760 miles to 692,378 in the same period, and in Ohio from 96,928 miles to 1,224,999 miles.

☞ A postmaster in Vermont wanted to be "dead headed" over the railroads, and for that purpose, it is alleged, represented himself to be a special agent of the P. O. Department. This came to the notice of Postmaster-General Campbell, who cut his official head off, making him a real "dead head." Served him right.

News Paragraphs.

☞ Several of the Americans who left Paris for the East, with the intention of joining the army of Omer Pacha, have returned, after a short stay at Constantinople. They found it impossible to get to Omer Pacha's camp, and such general disorganization reigned throughout the country, that it was extremely hazardous to attempt any traveling. Messrs. Greene and Quincy Shaw, of Boston, are among the return adventurers.

☞ The Roman Catholic bishops of Piedmont mention, as one of the reasons which should urge the Senate to reject a bill now before them, the fact that it "consecrates as a truth, the complete equality of all Piedmontese subjects before the law, as if Catholics and Protestants were perfectly equal in the face of God and the church, so as to enjoy the same rights and liberties in matters of worship!"

☞ The Batavia Advocate says that the sum of $90,000 has been secured to the Cary Collegiate Institute as an endowment by Col. Alfred Cary, its munificent founder, and that the sum of $5,000 has been raised by the citizens of Oakfield and vicinity, for the purpose of repairs and additions to the Seminary Buildings, and that another Seminary building will be erected immediately.

☞ The Cashmere Goat has been successfully introduced and bred in South Carolina. The Charleston papers say that the animal seems perfectly at home in the climate, and is as hardy and as easily raised as the common goat. The fleece obtained is in weight about equal to that of the choice varieties of sheep, while its value is ten times greater.

☞ At a Whiskey Manufacturers' Convention, held in Cincinnati, week before last, twenty-three establishments, mostly in Ohio, were represented, the whole of which are said to consume over 14,000 bushels of grain daily, or upwards of four millions per year, out of which ten million gallons of whiskey are produced.

☞ A burglar named Palmer, was shot by a little negro boy, on the 1st inst., while robbing the house of Mrs. Arnett, in Augusta, Georgia. The boy, waking in the night, found the door open, and seizing the gun, gave the alarm, and shot the robber as he rushed down stairs. Palmer was dangerously wounded.

☞ A quarrel occurred on the steamer Sierra Nevada, on her last trip up from Nicaragua, in which a passenger, John Gardner, stabbed and killed the second mate, Mr. Pratt. Gardner has been indicted. The deceased is represented to have been an estimable man and leaves a wife and child in Rhode Island.

☞ A stage loaded with passengers, ran off an embankment twenty or thirty feet high, making a complete somerset in its descent, between Waterbury and Cheshire, Ct., on Wednesday last. Strange to say, none of the passengers were injured, although one of the horses was killed.

☞ When the French troops embarked at Toulon for Constantinople, an old man who witnessed their departure, exclaimed, in a mournful voice:—"There goes my only child to fight for a cause he does not understand, and against men with whom he never had a difference."

☞ The brig Lawrence, bound for N. York, has been detained at New Orleans, in consequence of two slaves having been found secreted on board. They are supposed to have come from a plantation on the coast, where the vessel was loading a cargo of molasses.

☞ Two Frenchmen who were conveying the mails from the Sault St. Marie to Mackinac, over the ice, were drowned on the 24th April, when within two miles of their destination, by the ice giving way beneath their feet. The mails were lost with them.

☞ The number of persons in England and Wales in 1851, aged 70 years and upwards, was 513,305; aged 75 and upwards, 107,041; aged 85 and upwards, 33,201; upwards of 90, there were 7,726; above 95 there were 1,545; and 215 were upwards of 100.

☞ Hydroscopia is the name of a new species of humbug introduced into France; it is the art of evoking phantoms by means of a pail of water. It is quite popular in Paris, and has caused the degeneracy of spiritual rappings into mere divination.

☞ There are said to be some 17,000 of the Jewish faith in the U. States. Their churches number 31. Probably 6,000 Jews are to be found in the city of New York. They are not frequently found in our hospitals, and never in our poor-houses.

☞ The New Haven Register says the recent unreasonable weather can only be accounted for on the supposition that the persons in search of Sir John Franklin have gone through the north-west passage, and neglected to shut the door after them!

☞ It is estimated that 14,000 persons will come to this country this year from Norway and Sweden. These emigrants are generally substantial agriculturists, and the emigration is so great as to seriously affect the value of farms there.

☞ The Espana, of Madrid, of the 24th ultimo, mentions a report to the effect that de Turgot, the French ambassador, was about to give up his post, as the pain he experiences from his wound is so great that he is unable to discharge his duties.

☞ A law-suit pending for 50 years, Alexander Hamilton being at one time the lawyer on one side, has just been decided, and gives $50,000 worth of property in New York, to five children in Cleveland, whose father died a year ago.

☞ Charles Halbaway, of Windsor, Broome Co., N. Y., with his wife and two sisters, were drowned by the upsetting of a skiff in the Susquehanna river, on Sunday week. They were crossing the river on their way to church.

☞ Mr. Buchental, a wealthy Brazilian capitalist and speculator, has gone to Chili, to consult as to means of forming a railroad from Valparaiso to the Rosario, a stupendous undertaking, implying a tunnel through the Andes.

☞ The U. S. Minister to Nicaragua, Hon. Solon Borland, has resigned—to take effect the present month. Mr. Borland is the man who made a speech *two hours long* to the Nicaragua government, and "still lives."

☞ St. Paul's Church, in Baltimore, was destroyed by fire recently. It cost $140,000, and was insured for $20,000. It had been built some thirty years, and was considered one of the finest churches in the city.

☞ A verdict of $3,600 was obtained recently in the Superior Court, in New York, against the Hudson River Railroad Company, for causing the death of a gentleman named Burton, in November, 1853.

News Brevities.

—— Mr. Thackeray has arrived in Paris from his tour in Italy.

—— The walls around Salt Lake City are progressing rapidly.

—— The Czar of Russia and Edward Everett are of the same age.

—— The founder of the Menchikoff family was originally an itinerant pieman.

—— The first ship from sea, this year, arrived at Quebec last week Wednesday.

—— The Sultan of Turkey is thirty-one years old, and has reigned since July, 1839.

—— Capt. Thomas L. Ringgold, of the U. S. army, died in Washington, May 12th.

—— Some half a dozen soldiers deserted from the U. S. Arsenal at West Troy, last week.

—— The Whigs of Vermont will hold their State Convention at Rutland on the 7th of June.

—— The Newfoundlanders are said to have suffered dreadfully the past winter from famine.

—— An Indian woman died at Knight's Ferry, California, recently, at the age of 142 years.

Twenty-one fugitives from slavery arrived at Windsor by the "Underground Railway" during the past two weeks.

—— The subscriptions in aid of the Franklin Monument have reached $17,000. It is to be erected in Philadelphia.

—— J. R. Speed, late President of the Tompkins County Agricultural Society, was killed by lightning a few days since.

—— Wm. Richards, of the first Presidency of the Mormon Church, died last month. The vacancy has not been filled.

—— Mr. Ebenezer Tilden dropped dead in his field at Lebanon, Conn., while holding his plow. His son was driving the oxen.

—— The Albany Atlas notices Georgia Peas at $8 per bushel, as among the delicacies of the season offered in that market.

—— The city election in New Orleans on Tuesday week, resulted in the success of the Reform ticket by 1,709 majority.

—— There is a report from California that Miss Catharine Hayes has married Capt. Wm. E. Bushnell, a steamboat captain.

—— The Elbridge Manufacturing Company's Factory at Elbridge, Onondaga Co., was burned on the 11th inst. Loss $15,000.

—— It is confidently anticipated that the House Printing Telegraph will speedily supercede all other systems in England.

—— At the municipal election in Providence, May 10th, the Whigs elected the Mayor and almost the entire Board of Aldermen.

—— Wm. Slonaker, late navy agent at Philadelphia, is charged with being a defaulter to the government to the amount of $23,000.

—— The Buffalo City and New York Railroad Company fail to pay interest on their bonds. The May Coupons came back protested.

—— The Ontario County Times states that the Canandaigua Female Seminary has been sold to a gentleman lately from the South.

—— A new Baptist Church, in New York, that cost $75,000, under the charge of Rev. Dr. Dowling, was dedicated on Sunday week.

—— Five hundred and ten bushels of mail matter, for distribution, arrived at the Post-office in Cleveland, Ohio, on Wednesday morning.

—— The Croton Dam being repaired, the N. Y. Mirror says the New Yorkers are again in the receipt of their regular supply of—*milk!*

—— A smart shock of earthquake, of short duration, was felt at St. Thomas April 9th, between eight and nine o'clock in the morning.

—— It is stated that the biography of the late Professor Wilson will, in all probability, be given to the world by his son-in-law, Prof. Aytoun.

—— The next annual Fair of the Vermont State Agricultural Society will be held at Brattleboro', on the 12th, 13th and 14th days of Sept.

—— The Bridgeport Standard says that among the many articles which came floating down the Naugatuck river during the freshet, was a pulpit.

—— The Sarahville, Ohio, Courier, says Wm. Kissane, one of the Martha Washington party, has recently had a fortune of $200,000 left him in Europe.

—— It is said that Miss Dix threatens to make a publication, showing that President Pierce had declared himself favorable to her bill previous to its passage.

—— John Looney is under arrest in New York, for firing the premises he occupied, with the design of getting an extravagant insurance upon his effects.

—— There was a prize fight near New Bedford on Thursday week, in which a Yankee and an Englishman were the combatants. Jonathan beat, of course.

—— Morris's Turpentine yard near the Atlantic dock, in Brooklyn, was burned May 11th.—Large quantities of naval stores were consumed. Loss upwards of $50,000.

—— An impression exists among the shipbuilders of London, almost amounting to a moral certainty, that there is a Russian spy in every one of the British dockyards.

—— Eight indictments have been found at New Orleans against Philip Pendergrast, a notary public, and Wm. Wilder, a lawyer, for forging applications for bounty lands.

—— Cucumbers are selling in Cincinnati at twenty-five cents apiece. Green corn, asparagus, tomatoes and fresh peaches, are in the market, and sold at reasonable prices.

—— Fears are entertained for the safety of Capt. Cullinson, who went in search of Sir John Franklin and his crew. The Admiralty have given orders to institute a search for him.

—— James Brooks, senior editor of the N. Y. Express, has left for Europe, proposing to pass a few months in France, Germany, &c., furnishing letters for the Express during his absence.

—— Omer Pacha has six aides-de-camp.—They are all Hungarians, and are remarkable for the speed with which they go over the ground. They speak French and Turkish very well.

—— The small yacht which in 1810 was used by the Emperor Napoleon I., and the Empress Maria Louisa, at Havre, has been ordered to be brought up to Paris to be preserved as a relic.

—— Col. Fremont has not been heard from lately. Some of the men who accompanied him remained in the Utah valley, and from their statements, the whole affair, thus far, has proved a failure.

—— The electric telegraph to St. Petersburgh has been connected with the Prussian telegraph, and by this means St. Petersburgh is placed in direct communication with the capitals of Western Europe.

Foreign Intelligence.

Arrival of the Canada.

The steamer Canada, from Liverpool, arrived at Halifax, May 10th, bringing 250 passengers.

There is no intelligence of the steamer City of Glasgow. The steamer Atlantic arrived at Liverpool at 2 o'clock P. M., Friday the 25th ult.—News from the seat of war indicate increased vigor on the part of the allies. 20,000 French and 8,000 English troops had landed at Gallipoli.

Sir Charles Napier was at Stockholm on the 27th of April, and his fleet was about fifty miles off. The allied fleet in the Black sea were at anchor off Odessa on the 26th of April.

On the 26th ult. a sharp combat took place before Kalafat. Twenty squadrons of Russians with six guns, were making a reconnoisance of the Turkish lines, when the Turks sallied out two regiments of regulars and some bayonets and cannon, and after a combat of three hours' duration, obliged the Russians to retreat with a loss of 500 men. Omer Pasha was at Schumla concentrating his forces, apparently for defensive measures only. The Russians were still fortifying themselves on the Dobrudscha. They had not crossed the Trajan Wall. Their strength in the Dobrudscha is about 30,000 men. The forces before Kalafat were withdrawn towards Kinjova.

The British steamer Fury, of six guns, on the 11th inst., steamed under Austrian colors, within three miles of the entrance of Sebastopol, where she saw two merchantmen, two brigs, two frigates, and a steamer leaving the harbor. The Fury dashed in and seized one of the merchant ships and towed her off. The Russians gave chase, and the Fury was finally obliged to cut the prize adrift, but not until one of the frigates and the steamer came within range and exchanged shots. The Fury, after four hours' chase, succeeded in eluding the Russians and carried off the merchant ship's crew as prisoners, who gave some interesting information respecting the strength of Sebastopol.

A bold and successful feat is also recorded of the Russians. A steamship, supposed to be a Russian dispatch vessel under British colors, boldly steamed from the Archipelago, passed the Dardanelles and batteries and escaped into the Black sea.

From Asia we learn that 4,000 Turkish regulars refused to march from Ergeroum to the wars, on account of arrears of pay.

Accounts from Circassia of April 1st, state that the insurrection against Russia is becoming more general among all the warlike tribes of the Caucusses, where Schimayl's agents are indefatigable. The presence of the English and French fleets in the Black sea, with the consequent abandonment of the Russian's posts on the Circassian coasts, and the cutting of the Russian supplies via Redout Kale, had made a deep impression on the mountaineers, and it was believed that Schimayl would soon be in force to attack the Russian headquarters at Tiflis.

Arrival of the Atlantic.

The Atlantic arrived at New York, May 15, with Liverpool dates to the 3d of May.

It is authenticated that Odessa was bombarded ten hours by the allied fleets. Part of the city was laid in ruins. Four fortresses were dismantled. Three Russian and Austrian ships were burnt in the harbor, and three English bombarding steamers badly damaged.

The attempt of the British to land 1,800 men was repulsed. The Russian fleet came out of Soyastopol and threatened the allied fleets, but retired without giving battle.

The details of the bombardment are not yet received.

The Russians had completely evacuated Little Wallachia. The right wing of their army now rests on Aluta river, and the head quarters are at Bucharest. Therefore the interest of the campaign is again concentrated and in operation below Nicopolis.

The Turks have come out of Kalafat, and are occupying all the towns in the track of the Russians. The Russians are besieging Silistria, and would make the assault about the first of May. The allied troops are idle.

A private telegraph despatch from Odessa by an eminent Greek firm in London, dated 26th ult., stated that the whole combined fleet took their departure on that day.

The Austrian correspondence has another account under date of Bucharest, April 28th.—The English and French admirals demanded the delivery of the Russian vessels at Odessa.—On refusal, seven three deckers and eleven frigates bombarded the town on the 24th. The Woronzoff Palace was totally destroyed, and four frigates severely damaged.

The Journal of St. Petersburgh of the 23d ult., contains a proclamation from the Emperor in which he represents the war against England and France as one undertaken in defence of the orthodox faith.

Liverpool Breadstuff Markets.—Brown & Shipley say the market is rather lower—Flour having given way 6d, and corn 2s, at which there is a good demand, while wheat maintains previous rates.

White wheat maintains 11s 2d@11s 10d; red 10s 2d@11s 2d. Western canal flour 36s@36s 9d; Baltimore and Philadelphia and Ohio, 37s 6d; sour 33s@34s. Yellow corn 38s; mixed 37s; white 39s.

Produce Market.—McHenry says bacon arrives freely at 1s@2s lower. Beef in request; pork dull; lard working up. Tallow 3d dearer.

Cape of Good Hope.—The Barque Spring Bok arrived at Boston, May 15th, with Cape of Good Hope dates to March 24th.

The papers are filled with accounts of gold discoveries, said to extend over the whole sovereignty of Cape Town. Gold was said to be more plentiful on the surface than in California or Australia. Many parties were leaving for the "diggins." Agates and other valuable stones were also discovered.

Serious Railroad Accident.—The 10½ o'clock train on the Central Railroad ran into a freight train near Buffalo, May 16th, smashing locomotive and cars. Several passengers were hurt. One Irishman was killed.

The locomotive "Dean Richmond," three passenger cars, and one baggage car are complete wrecks. James Lonesbury, of Irving, had both legs broken and the lower part of his back smashed, and cannot live. H. W. Gifford, of Rochester, had a leg broken. James Buttman, engineer, had an arm smashed. The accident was caused by carelessness of men engaged in making up the 2 o'clock freight train, who left the cars on the main track.

The National Monument has been raised two additional feet during the past month. It is now one hundred and fifty-two feet high.

Commercial.

BUSINESS AND FINANCE.

Two California steamers, the George Law and the Star of the West, arrived at New York on the day of publication last week; the two having on board the aggregate of $2,000,000. The Arabia from Boston May 10th took out $100,000, and the Pacific from New York May 13th, $400,000 more.

According to a statement made by the Secretary of the Treasury, it appears that the whole amount of public stock redeemed since the 4th of March, 1853, is $18,373,714.—Premiums paid on same, $2,057,962. Principal of debt now outstanding, $50,115,572. There was on the 1st of January twenty-five millions in gold and silver in the Treasury Offices, and more gold and silver in circulation among the people than at any previous period in the history of the country.

From a tabular view of the condition of the banks in the United States, published in the *Washington Union*, that paper makes the following summary:—"The total circulation, according to returns nearest Jan. 1, 1854, was $204,000,000, and of deposits $188,000,000, making a total of current credits of $392,000,000.

As the total of circulation on the 1st of Jan. 1837, when the inflation of 1835-'37 was near its height, was less than $150,000,000, the present amount of paper circulation may seem alarming, but it is not so if we make due allowance for the difference in the condition of the country at these two periods."

Market Intelligence, &c.

Rural New-Yorker Office,
Rochester, May 17, 1854.

There is no wheat in the market, and scarcely sufficient flour for home consumption. The grain commands the nominal price of two dollars and twenty cents, and a few small sales have been made at $2,25. Flour is selling to the trade at $9,75@10, which is the highest figure yet reached this season in our market; and is besides in the teeth of foreign advices by the last two steamers, both of which state a decline in breadstuffs abroad. Corn is more plenty and lower, quoted at 70c. per bushel. Oats have gone up still higher selling at 50c.

Butter about as last quoted, but cheese has advanced a cent.

Hay is uncommonly scarce and high; best qualities bringing this morning twenty dollars a ton. This is the highest quotation made for a whole year. Farmers being busy putting in their crops, have cut off the supply.

Rochester Wholesale Prices.

Flour and Grain.		Fruits and Roots.	
Flour, bbl.	$9,75@10	Apples, bush.	,75@$1

Swine—Large Store hogs 4, 4¼@4½c per lb. York shoats to peddle, 5½ and 6¾c. Ohio 4¼@6; one ordinary lot 4c. At retail from 6 to 7½.

"Fern Leaves"—The *second series* of Fanny Fern's perennial "Leaves" is soon to be issued from the prolific press of Miller, Orton & Mulligan, Auburn and Buffalo. See announcement.

Dr. Alex. Witherspoon, a medical officer of the army, and much esteemed member of the faculty, died at Washington on Thursday evening of last week. Dr. W. was the medical attendant of Gen. Taylor during his last illness.

Marriages.

At Churchville, on the 11th inst., by the Rev. J. Butler, Mr. JOHN W. RICHMOND and Miss JULIA A. MOORE, daughter of M. Moore, Esq.

Deaths.

In Covington, Wyoming Co., N. Y., April 16th, Mrs. ELIZABETH LOCKE, relict of Josiah Locke, aged 80 yrs.

In Royalton, Niagara Co., N. Y., on the 10th inst., JOEL BIXBY, aged 87 years.

Only eight days have elapsed since the death of Mrs. B., at the age of 86 years. A union of sixty-six years, thus, after the lapse of a few days, becomes an eternal one. Mr. Bixby was among the pioneer settlers of this town, having resided here nearly forty years. As a neighbor, a man, and a Christian, he was widely known and esteemed, and a wide circle of relatives will ever hold him in endeared remembrance.—n.

FANNY FERN'S NEW VOLUME.

Composed entirely of New Matter. The Second Series, Fern Leaves from Fanny's Portfolio,

One volume 12mo, 400 pages, with Eight Illustrations, Designed by Coffin and Engraved by N. Orr. Price, $1,25.

Will be Published Thursday, May 25th, 1854.

In this new work the acknowledged genius of the gifted authoress is strikingly manifest. The pressure of adverse circumstances is now removed, and her inventive mind has had free play in the preparation of this second offering of her "Leaves." It is prepared with peculiar care, and is decidedly superior to anything which has yet issued from her spirited pen.

☞ The trade are respectfully requested to send in their orders as early as possible.

☞ *The first edition of 20,00 Copies is now Printing to meet Advance Orders.*

Address, (giving explicit shipping directions,)
MILLER, ORTON & MULLIGAN,
Auburn or Buffalo.

Judge of the Future by the Past!—The sale in this country has been 93,000 copies of First Series Fern Leaves and Little Ferns, and in England 32,000 copies—showing the astonishing sale of 125,000 copies of these two works within six months average time of their first publication; and, from the intrinsic superiority of the *Second Series*, and the avidity of the public to possess it, we do not doubt that it will reach an equally, or even a more extended sale.

FANNY FERN AS A WRITER.

Testimony of the Press.

Without doubt, at this moment, the most popular writer in the country.—*Religious Recorder.*

We do not believe the author exists, who can equal her sketches.—*Canada Christian Adv.*

As a brilliant writer, Fanny is unequaled by any, either American or foreign.—*N. Y. Dutchman.*

She has looked deep down into the human heart, and touched many a vibrant chord.—*Independent Press.*

Running upon the affections as a teaser, thoughtful and pathetic moralist.—*Arthur's Home Gazette.*

Full of flashes of light, wit, pathos and power.—*Wesleyan.*

Sparkling with crystal dews from the warm, generous, untrammeled woman-heart.—*Christian Intelligencer.*

All hearts beat responsive.—*Cayuga Chief.*

Redolent of poetic beauty, although composed in prose.—*Buffalo Christian Advocate.*

She stirs the profoundest emotions of the heart, and awakens the noblest impulses of the soul.—*Northern Christian Advocate.*

Do you wish to laugh? Do you wish to cry? Read Fanny Fern.—*Literary Echo.*

Her success is the triumph of genius, and a true, earnest, heroic heart.—*Phrenological Journal.*

Keeps the mind of the reader constantly on the *qui vive* and nourishes every humor of his head and heart.—*N. Y. Commercial Advertiser.*

Sue overflows with the abundant sympathies of her nature—heart, soul and rare witchery are in her words.—*N. Y. Journal.*

There is not a hearth that will not commune with her—there is not a heart that will not echo back the breathings of her nature.—*Buffalo Republic.*

Pictures of love, of beauty, and of suffering, equal to the best sketches of Dickens.—*N. Y. Mirror.*

An inventive and beautiful mind, and a pure, gentle and loving spirit.—*Albany Argus.*

Sweet, womanly, and surcharged with a tender pathos.—*N. Y. Tribune.*

Sparkling with the freshness of the dew-drops, and redolent with the heart-inspiring fragrance of the Fern.—*Philadelphia Saturday Courier.*

Short but beautiful lessons.—*N. Y. Times.*

True to life.—*Literary Advertiser.*

In sympathy with the true, the meek, and the lowly.—*Utica Herald.*

Every article and every line sparkle and glow with exquisite pathos, keen satire, and brilliant wit.—*Boston True Flag.*

The leaves of Spring will not be more welcome than her Fern Leaves.—*Syracuse Standard.*

☞ For sale by Booksellers throughout the United States and the Canadas.

, Single Copies, sent by mail, postage pre-paid, to any Post-office in the United States, upon receipt of the retail price. Address us, either at *Auburn or Buffalo.*

228-tf MILLER, ORTON & MULLIGAN.

SMITH'S PATENT CAST IRON FENCES,

Verandas, Balconies, Portices, Monuments, Door Steps, Carriage Steps, &c.—The subscriber is prepared to furnish all the above named descriptions of Cast and Wrought Iron Work, at short notice, and in a great variety of patterns, and of the most modern style.—Important improvements have been made in making and putting up this kind of Iron Work, which materially adds to its strength and beauty, and enables him to offer it to the public at greatly reduced prices. All of the above work is easily taken apart, for repairs or other purposes.—When desired, as matter of economy, a stone post, as a substitute, can be set below the action of the frost, 8 to 10 inches above the surface, to which the fence is fastened with an Iron Base, either carved or plain, which is decidedly more secure against the action of the frost, than a stone foundation, and is more ornamental. This, together with the other improvements, reduces the cost full *one-half.*

Verandas.—The improvements in these Verandas render them decidedly stronger, more ornamental, and much cheaper than the old method of putting them up. A beautiful article can be furnished for less money than the cost of one of carved wood. He has a style suited to cottages, which will come very cheap.

Porticos of a new style, with carved, open-worked columns and cornice—a beautiful article.

Cemetery Work is especially provided for, as we have an elegant set of patterns for Monuments of Cast Iron, which are covered with a metallic substance to prevent rust. The cost of these will be very much less than marble.

He can also furnish Iron Door Steps, Carved Balusters for Stairs, bronzed, and almost any description of architectural and ornamental work, having one of the best, if not the very best, designer and carver in the country, employed expressly for this branch of the business.

His method of putting the work together is so simple, that, being provided with a plan for a Fence or Veranda, the order can be furnished complete with all its parts, marked and numbered, so that any ordinary mechanic can put it up. Distant customers may, therefore, order work of him, feeling an entire confidence that they will find no difficulty in putting it together.

N. B.—The Carved Work, under each cut, represents an open base; customers can have either at the same price.—I have a great variety of patterns; and am also getting up a style of Fence peculiarly adapted to Public Grounds; very bold and cheap.

Orders from abroad will receive prompt attention. All inquiries will be answered with pleasure, by H. N. LANGWORTHY, of the city of Rochester, who is my authorized agent and contractor for the counties of Erie, Niagara, Orleans and Genesee, to whom all orders for the work should be addressed. (227) A. G. SMITH.

PURE SUFFOLK PIGS FOR SALE.

The subscriber has four pair of pure bred Suffolk Pigs for sale. Price, $16 per pair. Also one boar pig; price $8. Can be forwarded by Railroad or Canal.

Address E. H. GILBERT,
May 10, 1854. [227-21*] Nunda, Liv. Co., N. Y.

Moore's Rural New-Yorker has become a giant among its kind. With a subscription verging fast to 30,000, and with a conductor who knows how to polish it with every grace of the art, and how to accomplish it with the best talent of the age—it is not surprising that it is now the leading agricultural paper of the country.—*Christian Adv.*

We know of no paper we can recommend so cheerfully as this.—*Monroe (Mich.) Express.*

MANNY'S PATENT REAPING AND MOWING MACHINE, WITH WOOD'S IMPROVEMENT.

This machine, as upon trial at Geneva, was found on bringing it into use by different hands, and under less favorable circumstances, not to work well. As now constructed, while it retains the good points that all conceded it possessed last year, is entirely free from the defects that caused it to prove so unsatisfactory to the farmer as a Reaper, on account of the difficulty in discharging the grain, its want of capacity and strength; and as a Mower, in its defective cutting apparatus, and its liability to clog and break, and its unwieldiness and complicated construction. The machine, as improved and now manufactured, is without front wheels, has a flat and capacious platform for grain, the speed is increased one-fifth, and three-fourths inch added to the length of cut. A smooth edge is used for grass, and sickle edge for grain. The guard cap left open behind so as to prevent all clogging, and the machine is built much stronger, with 200 pounds less weight.

The subscriber was early, in last harvest, convinced of the necessity of these alterations, and immediately commenced and matured them in time for a thorough trial both in grain and grass, and now offers them to farmers on the following warrantee:—My combined machine weighs 750 lbs., and is warranted capable of cutting an acre per hour of any kind of grass, as well as ordinarily done by hand by the best mower, and to work well as a Reaper. I have a machine for mowing alone, which is warranted as above, and weighs 630 lbs. Either machine will take one-fourth less power to mow than any other mower made.

Price of the Combined Machine, delivered on the cars at Hoosick Falls, $125 cash. Price of the Mower, $110 delivered to the farmer. Orders should specify which is wanted, the Combined Machine or Mower. Machines can be ordered of H. N. Chapin, No. 68 So. St. Paul st., Rochester; Gen. R. Harmon, Wheatland; Sylvester Harmon, Mumford, or from WALTER A. WOOD,
227-2t Manufacturer and Proprietor,
Hoosick Falls, Rensselaer Co., N. Y.

GREAT PUBLIC SALE OF BLOODED STOCK.

The subscriber, having spent the most of the past winter and spring in Kentucky, has selected from the choicest herds of blooded cattle, upon the different plantations of that country, upwards of one hundred head of the best specimens of the Durham blood, a part of which are from the old Ashland Estate of the Hon. Henry Clay.

He has also selected about one hundred fat cattle, eighty-five of which are *spayed heifers*; also about five hundred sheep, most of which are coarse wooled, about one hundred ewes and lambs, the balance are fat wethers, weighing from one to two hundred pounds each; also a few pairs working oxen and mules. The above stock will be imported into this country in May, and will be sold at public auction, on the farm of Richard Peck, two miles east of Lima village, Livingston county, N. Y., on *Friday, June 2, 1854.*

The sale will commence at 10 o'clock, A. M., and continue until through. Carriages will run to the place of sale, from the cars at West Bloomfield and Honeoye Falls, on the Niagara Falls Railroad.

The subscriber is confident that this stock is *fully equal*, if not superior, to any former importation into Western New York. He is also of the opinion, that, with the variety of climate, and the abundant resources and facilities of this vast country for the improvement of stock, we are no longer under the necessity of subjecting ourselves to the enormous expense and hardships of resorting to the "Dimity Fraternity" of England; for, after having received from our old "Matron," her best blooded stock and most scientific crosses, we can soon teach her what she already fears, that her "feminine majesty" will soon be obliged to exchange her treasures, for a selection from our own stock, paying equally as liberal for the privilege as we have formerly done.

A liberal credit will be given at the above sale, hoping that all will avail themselves of this opportunity to improve the stock in this country. JOHN W. TAYLOR,
May, 1854. [227-3t] East Bloomfield, N. Y.

THE PEOPLES PATENT OFFICE.

This well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with Inventors from 9 A. M. to 5 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid, ALFRED E. BEACH,
Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

The People's Journal, a record of Science, Mechanics, Invention and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only One Dollar a Year, sent by mail. Specimen copies 12½ cts. Address as above.

Bone Dust.—We can supply a few barrels of genuine coarse bone dust, at $2,50 per barrel.
227 H. C. WHITE & CO., Buffalo Ag'l Warehouse.

To Young Men.—Pleasant and Profitable Employment.—Young men in every neighborhood may obtain healthful, pleasant, and profitable employment, by engaging in the sale of useful and popular Books, and canvassing for our valuable Journals. For terms and particulars, address, post-paid, FOWLERS & WELLS,
No. 308 Broadway, New York.

P. S.—All Agents who engage with us will be secured from the possibility of loss, while the profits derived will be very liberal. 226-4t

ENGINE AND BOILER!

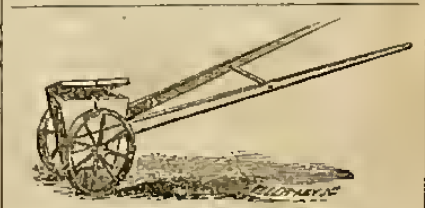
The subscriber has an "A, No. 1" 10 to 12 Horse Power Engine. Has been used 3 months only! Will sell cheap!
Address PETER SAXE, P. M., Yates, Orl. Co., N. Y.
April 26, 1854. 226-3t.

Osage Orange Seed.—We will supply new crop Osage Orange Seed, at *Seventy-five cents* per quart, neatly put up, and with each package full directions for cultivation. Address orders to H. C. WHITE & CO., Buffalo Ag'l Warehouse and Seed Store, Buffalo, N. Y. 223-tf

AGENTS WANTED.

Chances for making Money!—The Publishers of a large list of highly entertaining, useful and popular books, offer great inducements to 500 energetic and thorough-going business young men, to engage in the sale of these publications, in which any young man of good business habits may make FIVE TIMES the amount, over and above all expenses, of the average wages of Common School Teachers. The most liberal discounts are made to Agents from the list of prices. The Books command ready sales wherever they are introduced. None need apply unless they wish to devote their whole attention to the business, and who cannot command a cash capital of from $25 to $100, or give undoubted security for the amount of goods entrusted to them.

Full particulars in regard to terms, &c., will be furnished by calling on, or addressing, post-paid,
WANZER, BEARDSLEY & CO.,
25 Buffalo street, Rochester, N. Y.,
Or, ALDEN, BEARDSLEY & CO.,
223-3t Auburn, N. Y., Publishers.



HALLOCK'S HAND SEED DRILL.

This Drill is adapted to sowing carrot, turnip, beet, onion and other small seeds in drills, with perfect regularity and without regard to their weight or shape. The seeds are forced out by a circular brush, which revolves against a perforated tin plate inserted in the bottom of the hopper. A series of these plates accompanies each drill, with holes of different sizes for regulating the quantity and kinds sown. It is a light, compact, and durable machine, and not liable to get out of order. 200 of these Drills were sold last season, giving entire satisfaction. They are warranted to perform as above stated. They can be forwarded to any part of the country by railroad or stage. Remittances by mail at my risk. All orders (which should give full directions for forwarding,) promptly attended to.—Price $5. Address E. D. HALLOCK,
227-2t 24 Exchange St., Rochester, N. Y.

FOREIGN PATENTS.

The undersigned continues to act as Solicitor and Agent for securing Patents in all countries where they are granted. He is represented in Europe by honorable and reliable men, of long tried experience, through whom he is enabled to secure Patents in England, Scotland, Wales, Ireland, France, Belgium, Germany, Austria, Russia, Prussia, Spain, Portugal, &c. His facilities for transacting foreign Patent business are unsurpassed. He can generally obtain Certificates of Provisional Protection from the British Patent Office, within six weeks from the time the invention is first committed to his care. The cost of British and other foreign Patents, to Americans, has been greatly reduced.

The undersigned may be at all times consulted, free of charge, by letter, or personally at his office, in reference to Patents, Inventions, &c. All consultations and business strictly private. For further information, apply to or address. ALFRED E. BEACH,
227-tf Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau-street, New York.

IMPORTED TOBACCO SEED.

We have on hand some choice varieties of Havana and Cuba Tobacco Seed, which will be sold in packages. For one dollar we will sell one package or two half packages of different varieties, accompanied with pamphlet directions for cultivation. Address H. C. WHITE & CO.,
227-2t. Buffalo, N. Y.

CALCINED BONES.

The subscribers have some hundreds of barrels of calcined bone-dust, a valuable manure, which will be delivered on the Railroad or boats at $1,25 per barrel or three and a half bushels. Orders by mail will receive the most careful attention. (226-4t) H. C. WHITE & CO.

SUFFOLK PIGS.

The subscribers are now prepared to receive orders for pure Suffolk Pigs, bred from stock imported in 1848, by the late Wm. Stickney and by the subscribers, in January. Also, an importation of 12 in October, 1853.
Address JOSIAH STICKNEY, Watertown,
or ISAAC STICKNEY, Boston, Mass.
Boston, March, 1854. 223-w81am-2m

NEW YORK RECORDER.

Tenth Volume Enlarged, in quarto form. The Largest Baptist Newspaper in the World. Price, in advance, by mail, $2; by carriers, $2,50. Lucius F. Belcher & Co., Proprietors, 122 Nassau Street, New York.

In the determination to make their journal a complete repository of general and denominational religious intelligence, and of the news of the day, as well as the earnest advocate of sound Christian doctrine and social progress, the proprietors will summon for these ends every available facility, whether editorial, or in the way of contributors or correspondents. They have engaged able writers at home, and their correspondence from England and Continental Europe, from Asia and every part of America, they believe to be unsurpassed. By furnishing a paper of the highest grade, from this great commercial centre, they hope to increase the patronage with which they are already favored from every section of the United States and the neighboring British Provinces.

The tenth volume commenced March 29th. Subscriptions are solicited, and the present is suggested as the best time for forwarding names with payments accompanying.
S. S. CUTTING. (223-6tw) L. C. BEECHER.

FORBUSH'S MOWING AND REAPING MACHINE.

Patented July 20, 1852.

The American Mowing and Reaping Machine Co. have purchased the Patent Right for the above Machine for the United States, England and Canada, and are now manufacturing a large number to supply the demands of the coming season. The advantages which this machine possesses over all others are obvious, and will readily be acknowledged by all disinterested persons. Being a *combined machine*, and working equally well in grain or grass, it enables the farmer of moderate means to procure a valuable *Reaper and Mower* in one, which will do the work of both, and at less than half the usual cost. As a Mower it has no superior; it was thoroughly *tested* the past season in every variety of grass, and in many different sections of the country, and in every case where it was properly made, it gave perfect satisfaction. It will cut and spread from 30 to 35 acres of any kind of grass per day. As a Reaper it has never been excelled, and has no rival that can in all respects successfully compete with it. The patent for this machine covers many points of excellence which have heretofore been unknown, and which (of course) can be used in no other. In the construction and arrangement of these machines great pains have been taken to ensure the necessary strength, simplicity and durability. They are easily kept in order, and it requires but a few moments to change the machine from a Mower to a Reaper, and in either form it is equally strong and substantial. It is not liable to get out of order, and if any accident should happen it could be readily repaired by any ordinary mechanic. In the construction of the machines no expense has been spared to render them both perfect and durable. The Mower weighs but 731 lbs.—the Mower and Reaper combined 900 lbs. To any person desirous of purchasing, or of understanding the machine more fully, illustrated circulars will be sent with full descriptions, references, &c., &c.

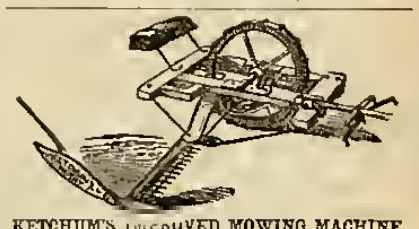
Price of the Mower, ... $110 00
" " " and Reaper, ... 130 00

Terms—Cash in Buffalo. Delivered on boats or cars, free of charge.

Address orders or communications to the Company, or CHAS. W. SMITH, *Sec'y*, Buffalo, N. Y.

Further information can be had, and machines purchased of the following Agents:

S. M. Drake, Skaneateles, N. Y.
John Adriance, Poughkeepsie, N. Y.
Longett & Griffing, 25 Cliff St., New York City.
A. Wadham, Goshen, Conn.
A. W. Tucker, New London, Conn.
S. V. R. Trowbridge, Birmingham, Mich.
Gould & Bennett, Brantford, C. W.
J. S. Love, Beloit, Wisconsin.
Thos. H. Allen, Waverly, N. Y.
C. J. Allen, Shelairville, Chaut. Co., N. Y. 222-13t



KETCHUM'S IMPROVED MOWING MACHINE,

With entire change of Gear, the only Successful Mower Now Known.

Ketchum's *Improved* Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: *durability, convenience and ease of action.* The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxing. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being *on upper side of the frame;* oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its whole width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

It requires not over ten minutes to get one ready for operation, there being but two bolts, (besides the pole bolts,) to be secured to have one ready for use. They will cut *all kinds of grass*, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair; it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make this machine deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying *untried* Mowers; if they do (as was the case with many last year) they will incur loss, vexation and disappointment.

If any parts are wanted to repair any machine we have sold, or may hereafter sell, they will be furnished and only manufacturers' cost for the same be charged.

☞ In all cases where extras are wanted, be sure to give us *the number of your Machine.*

(Warranty:) That said machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of *any kind of grass*, and do it as well as is done with a scythe by the best of mowers.

The price of the Mower, with two sets of knives and extras, is $110 cash, in Buffalo, delivered on board of boat or cars free of charge.

Office and Shop, corner of Chicago street and Hamburgh Canal, near the Extern H. R. Depot, Buffalo, N. Y.

HOWARD & Co., Manufacturers and Proprietors.

The Mower is also manufactured by Rogers, Norcross, Mason & Co., at Worcester, Mass., for the New England States.

By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan.

By Warder & Brokaw, Springfield, O., for Ohio and Kentucky. 220-4t.

J. Rapalje & Co. are also sole Agents for the sale of Ketchum's Mowing Machine in Rochester, and for the vicinity. 220-Uy m11-3t

Poetical.

[Written for Moore's Rural New-Yorker.]

FRIENDSHIP'S OFFERING.

TO L. H. E.

Is thy young heart o'erclouded with sorrow and care
When all is so beautiful, fragrant and fair?
When spring has returned with its sunshine and showers,
Its wild singing birds, and its delicate flowers?

Oh! why does a shadow steal o'er thy fair brow,
That was beaming with pleasure and rapture but now?
Have the friends that you loved grown cold and estranged,
And those you deemed truthful, oh! say, are *they* changed?

Yet do not despair nor grow weary of life,
Though much you have known of its passionate strife;
But wait till you weep o'er the loved and the dead,
And feel that o'on *hope* forever hath fled.

Then do not let sorrow within thy young breast,
E'er find out a place to nestle and rest;
For many will love thee—thou 'rt noble and kind,
Generous of heart, and exalted of mind.

Spafford, May 5, 1854. "LELLY."

Rural Sketch Book.

THE MAY QUEENS.

A CONTRAST, AND ITS MORAL.

We all welcome May. March shakes his fist roughly at us, showing that he is a regular "chip of the old block," inheriting the surly temper of his father. April is capricious,—all smiles and tears; there is no dependence to be placed upon her; but May comes in with her love-tokens of crocuses and daffodils, and wins us over to the faith that Spring is far advanced, and Summer is at hand. Now, in the morning, with the children, we loiter before the Southern grass plats, and peep through dusty fences, to see and enjoy the young flowers, and at noon-time we are found on the shady walks.—We are quite ready for a stroll to the Common, on May-day; though we loiter still before the cages which are hung out here and there, that we may listen to the canary-birds. They delight in the balmy air and in the blue sky, unconscious apparently of their cage-wires: for they sing away as if they would sing their little hearts out. Not are they the only ones who delight in May-day.

On such a morning as is here described, when we entered the mall and took seats under the budding elms, we found a May-pole had been put up in the night, and was in full bloom with roses. Around it young girls dressed in white, danced hand in hand; and one with flowing golden curls wore gracefully a crown of roses. She was the *May-day Queen*, chosen, as one could see at a glance, for her great beauty. She was tall for her years, which could not have numbered more than fifteen; she had a figure light and fairy-like, and a countenance cast in a Grecian mould, almost faultless in its profile. With cheeks flushed by excitement, eyes sparkling, her broad forehead sublimed in the mellow shadow of the rose-crown, she was exceedingly lovely. Round and round her, hand in hand, merrily singing, danced her white-robed friends, stopping every now and then, in the evolutions of the figure, to pay their obeisance to the queen, and cast flowers at her feet. This homage she received and acknowledged with much grace and an innocent pride. It was a beautiful sight—in full harmony with the beautiful May morning. The old apple-woman under the trees forgot alike her knitting and her customers; even the man of business paused in his hurried walk, and expended several golden minutes on such a pretty sight.

After a time, a somewhat singular spectator appeared. A gentleman, apparently a young gentleman, wrapped in a Highland shawl, with which he concealed his face, wearing a little jockey cap, began to pace back and forth in the mall, not far from the May-pole. It soon became evident that he was attracted by the May-queen. Once, when she was singing to her court, he almost stopped opposite her; then he recommenced his slow pacing, back and forth. His manœuvres at length attracted the attention of the party. The young girls smiled significantly one to another, and besought the queen to look upon her admirer; and she, though with becoming dignity resenting his homage, yet followed him with side-way glances. The color deepened a little in her cheeks, and there was now and then an added grace, which showed that she was conscious of being observed. Still, while the dance continued, back and forth passed the Highland plaid. At length the little dancers were weary, warm and thirsty, and the May-queen proposed rest and refreshment, and cooling ices at Vinton's. Thither her party, still in rose-wreaths, followed her. Room was given them on the side-walks, and also an honorable place at Vinton's. When merrily seated at their ices, the May-queen, who had laid aside her crown in order to cool her brow, looked up and caught a glimpse of the Highland plaid at the door.—It fluttered there a few seconds; its wearer, carefully concealing his face, reconnoitered the premises, and then disappeared. The young girls broke out into a merry laugh, while the queen, with burning cheeks, tried in vain to look dignified.

"Perhaps the Highland chief intends to wait and follow you home, Rosa," said Nannette, her sister, who was also her maid-of-honor; "how father will laugh!"

"Don't tell him, Nannette," said Rosa; "he will think we are foolish to take any notice of him."

Nannette, however, did not obey this injunction, for as soon as they were seated at the dinner table, she told her father the whole story; how Rosa had been chosen Queen of the May, and had been closely watched, through the morning, by a gentleman in a Highland plaid.

"Indeed!" said her father, with much surprise; "who was he? With your majesty's permission I must look into this a little. Did you encourage him, may I inquire?"

"Indeed, papa, I did not," said Rosa; "I only looked once in a while, to see if he was still there; and at last, when we found he would not go off, we left the Common, and went to Vinton's."

"Yes, and don't you think, papa," said Nannette, "he came there and looked in the door; but he kept his face so wrapped up in his shawl, we could not even see his eyes. He pulled his cap down, too. We concluded he was discouraged by the sight of Rosa's great glass of cream, and would not wait for her to finish it."

"This is a marvelous story! Who was he, I wonder? Did he remind you of any one in particular?"

"Yes, papa, he was just your height."

"Indeed!"

"Yes, and he walked like you; and his hair in his neck looked just like yours; I noticed it."

"You must have noticed him a great deal, then, my little May-queen."

"Father," said Nannette, "how roguish you look! I do believe you know something about it?"

"*I!* how should *I* know anything about it?"

"Ah, but I know you do. And now I do really believe it was you, yourself, papa, in a borrowed shawl and cap. Wasn't it? There," said Nannette, clapping her hands, "you laugh; now I know I've found you out."

"Yes, you are right Nanny," said her father.

"O, Rosa! only think—it was father!—What will the girls say?"

Rosa tried to laugh, too, but she felt more like crying; tears really came into her eyes.—She felt a little ashamed of herself; she would not willingly have exhibited so much vanity before her father. He understood her feelings at once.

"My dear daughter," said he, drawing her to him, and placing her arm on his shoulder, "are you not as much pleased with the admiration of your father as you would be with that of any other gentleman?"

"Yes, papa," said Rosa, "but I am so afraid that I was silly!"

"And if you were, my child, would any other gentleman be as ready to make allowances for it as your father would?"

Rosa nestled nearer him.

"I wish to enjoy the day with you, my child. It gave me a great deal of pleasure to watch you and Nannette, unknown to you. It made me happy to see you hear your honors so gently, and also to see that you were considerate of the comfort of your young friends." He pushed aside her ringlets, and kissed her fair brow. "My little Nanny, here, also made her father glad, by her generous devotion to the queen."

His young daughters looked up, smiling; they returned his caresses affectionately, and laid their soft, blooming cheeks to his, and felt happy, and satisfied, and secure in his love.

He, with a full heart, wished they might always thus confide in him, and that he might ever thus encircle them in his protecting arms. The affection of such a father for his daughters is tender and beautiful; it does us good to contemplate it, and to keep our hearts sensitive to its value. In its charge we cheerfully leave our May-day Queen and her amiable maid of honor, for the May-day shines brightly on other spots than Boston Common, and another May-day party claims our attention.

This party belonged in country villages adjacent to Boston. They had left their homes early, and were now straggling through dewy leaves and wet fern, climbing stone walls and slippery rocks, wading through meadow lands intersected by running brooks, that they might hold their festival in a distant grove. They reached it, but, of course, with wet feet and draggled dresses, and then found the grove so chilly and damp, they were glad to adjourn to a dry, flat rock, in an open field. Having taken possession of the sunny side, they deposited their baskets, and proceeded first to gather wild flowers, with which to crown a Queen.—They could find only a few violets, and buttercups, and dandelions; but with these they wove fox-berries and evergreens, and made a pretty wreath. They then chose their Queen; and their choice fell upon one who, like our Rosa, was about fifteen—tall also, and delicate. Her face, with its regular features and pure complexion, ought to have been handsome, and would have been so, but for a certain sad and mature expression which it generally wore; an expression which indicated that, young as she was, she had known trouble.

Her name was Susan Price. She was a kind-hearted, generous girl, and a general favorite among her companions. She was much pleased at being chosen Queen; an unusual light danced in her blue eyes, and a hidden spring of gayety came bubbling up for the occasion.—She entered into the sport as she did not often do, and sang and danced on the rock with the rest. She seemed to receive with intense satisfaction the courtesy and consideration which were paid her. She seemed to enjoy her brief season of power with her whole soul; she almost felt as if she were a Queen, and for a time forgot that she was only a child of sorrow.—The dance over, the weary girls threw themselves down on the rock, and prepared their breakfast, serving it on fern-leaves and flag-root rushes. It was a merry breakfasting; and when it was over, the sun had mounted somewhat high, blue-birds were singing, and it was time for a homeward start, for all the party, young as they were, had yet a day's work to do.

The May-queen now picked her way carefully through the meadows and over the fences, for she feared to disturb her crown, and to dispel the bright illusion that was born with it.—She wore it quite through the village home to her own door. Here she took her leave of her young friends, and when they were out of sight, she stopped and listened. All was still; so she gently raised the latch of the door, and went softly into the kitchen. As she hoped, she found her mother there alone.

"Mother, mother!" said she with unusual eagerness, "look at me. I am Queen of the May. See my crown—is it not pretty?"

"Yes," said her mother, turning round a pale, worried face, and looking up with a heavy eye; "yes I see," and then returned to her work.

Susan began to tell her, in an earnest tone, the adventures of the morning; she could think of nothing else, for the May-crown was yet on her fair brow, and she was yet a queen.

"*Hush!*" said her mother, significantly, pointing to the bed-room. Susan hushed in an instant, for she now heard a loud and angry voice. Her father was scolding one of his boys.

"What—*again*, mother?"

"Yes."

"Bad as ever?"

"Just as bad."

"O dear! O dear!"

A heavy step—her father was approaching. Susan Price turned, slipped out the back way, and softly closed the door after her. She sat down on the stone step. The May sun still shone brightly, and the blue-birds sung, and seemed to wish to cheer her. She took off her crown, re-arranged its rubies and diamonds, and then put it on again. She then took off her shoes, and held out her chilled feet into the friendly sunshine, and spread her draggled dress to dry. She was still a queen, for the illusion would not soon vanish; and she hummed softly the May-day songs, which had been sung that morning. Suddenly she received a hard blow on her head—her crown fell into the mud, her song ceased. She sprung up with a bitter cry, for her angry father stood behind her.

"You lazy slut," said he, "why ain't you in helping your mother get breakfast? Up and along with you, I say!"

Susan obeyed instantly. She did not stop even to look for her crown—she no longer had subjects—alas, poor girl she no longer had a father. *Drinking* had turned him into a brute.

That hidden spring of gaiety which had bubbled up so freshly at early dawn was sealed as if with seven seals. The past vanished; she lived only in the dreary present; and, with a countenance fully reflecting her mother's worried expression, and with the same heavy eye, went about her day's toil.

Once there had been no need of toil, for this family were in easy circumstances; the father was a sober man, and they were a happy family. But times were sadly changed; for he had engaged in business in Boston, and then, in *respectable* places—yes, in dazzling saloons and "first class" hotels, frequented by the rich and honored—he had been tempted, and had fallen. The result was the scene in that desolate home on May morning.

Thus, even to-day, all around us, young hearts are breaking, and gentle spirits are crushed and bleeding, because he on whom they have leaned has sold his soul for strong drink. Yet we must not save them! O, not for are we not told that we must not interfere with the *trade* of our goodly city? The tempter who pockets the gain builds his palace on the ruins of many such desolate homes; and young May-queen's hush their songs, and weep around it, and grow old in childhood.—But we must not cheer them! O, not for the interests of a great *trade* would suffer, and then how could we compete with rival cities? So they that are in authority tell us, and their voice is echoed from high places—and surely,

"Brutus is an honorable man;
So are they all, all *honorable* men.

—*Tell-Tale or Home Sketches.*

THE HAIR HARVEST IN FRANCE.

Both England and the United States draw a large portion of their supply of human hair, and of articles made of hair, from France and Prussia. A singular feature on the Continent is this "hair harvest," as it has been termed.—Young women in England, who have beautiful tresses, are occasionally, we know, urged by poverty to part with them for money to the hair-workers; but, in France and Germany, it is a regular system. There are, we are told, hair merchants in Paris, who send agents, in the spring of each year, into the country districts to purchase the tresses of young women; who seek to obtain an annual crop with the same care as a farmer would a field-crop. The agents frequent festivals, fairs and markets; and have with them a stock of handkerchiefs, muslins, ribbons, &c., which they give in exchange for the far more graceful and natural ornament—the hair. So sensitive a barometer is commerce of slight changes in the value of exchangeable goods, that the agents know the hair of a particular district to be worth a few more sous per pound than that of a district thirty or forty miles away—a fact which naturalists would have been long in finding out.—The price paid is about five francs (4s. 2d.) per pound. The agents send the hair to their employers, by whom it is dressed and sorted, and sold to the hair-workers in the chief towns of the empire, at about ten francs per pound.—That which is to be made into perukes is purchased by a particular class of persons, by whom it is cleaned, curled, prepared to a certain stage, and sold to the peruke maker at from twenty to eighty francs per pound. The peruke maker gives it the desired form, when, as is well known, it commands a very high price; a peruke is often sold for double its weight in silver. Formerly, the manufacturers of artificial-hair into wigs, ladies' curls, &c., obtained a considerable portion of their supply at home from hospitals, prisons, and work-houses; but now the hair is not cropped compulsorily, as was formerly the case, and the poor and distressed, or criminal, are not deprived of their fair and valued tresses. It must be understood that female hair alone is of any use to the hair-worker, from its length and curling properties. The most prized, is the grey hair of aged persons, which can be prepared to any shade.

When Abernethy was canvassing for the office of surgeon to St. Bartholomew's Hospital, he called upon a rich grocer. The great man, addressing him, said, "I suppose, sir, you want my vote and interest at this momentous epoch of your life." "No, I don't," said Abernethy, "I want a pennyworth of figs. Come, look sharp and wrap them up; I want to be off."

Youth's Corner.

ILLUSTRATED REBUS, NO. 22.

Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

AN ACROSTIC GEOGRAPHICAL ENIGMA.

I am composed of 19 letters.

My 1, 14, 10, 4 is a town in Spain.
My 2, 13, 10, 14, 4, 6 is a county in Michigan.
My 3, 14, 12, 7 is a county in Georgia.
My 4, 10, 9, 11, 2, 19, 8, 17, 4 is a town in Mo.
My 5, 18, 10, 4, 13, 6 is a town in So. America.
My 6, 15, 8, 10, 4 is a river in Siberia.
My 7, 17, 9, 10, 15, 7 is a town in Massachusetts.
My 8, 18, 11, 5, 10 is a river in South America.
My 9, 17, 2, 8 is a county in Virginia.
My 10, 4, 17 is a town in Russia.
My 11, 10, 4, 14 is a river in Asia.
My 12, 2, 14, 19, 8, 6 is a town in Africa.
My 13, 16, 2, 9, 14, 4 is a county in North Carolina.
My 14, 11, 7, 10, 4 is a county in Ohio.
My 15, 18, 7, 10, 6 is a river in Europe.
My 16, 14, 7, 12, 2, 9, 10, 15, 11 is a town in Me.
My 17, 7, 10, 6, 4 is a town in New York.
My 18, 11, 10, 6 is a lake in Europe.
My 19, 10, 9, 4, 14, 4, is a town in Georgia.

My whole is the name of a late prominent member of the U. S. Senate. D. P.

Henrietta, N. Y., 1854.

☞ Answer next week.

[For Moore's Rural New-Yorker.]

A Problem.—A constable in pursuit of a thief at a uniform pace, finds by inquiry, that the thief is traveling 1½ miles per hour quicker than himself; he therefore doubles his speed after the first four hours, and takes the thief at the end of six hours and twenty minutes from the time of his starting. Given that the thief had a start of one hour, and never varied his speed, find the rates of traveling of the two parties, and the distance at which the capture took place?

Wit and Humor.

A domestic, newly engaged, presented to his master, one morning, a pair of boots, the leg of one of which was much longer than the other.

"How comes it, you rascal, that these boots are not of the same length?"

"I really don't know, sir—but what bothers me the most is, that the pair down stairs are in the same fix."

A wag was one day speaking of two of his acquaintances who had gone west, where new comers were usually attacked the first season, with the ague, and said he:—"Neither of these two men will be afflicted." "Why not?" inquired a bystander. "Because," was the reply, "one of them is too lazy to shake, and the other won't shake unless he gets pay for it."

To Catch Rats.—Take your bed and place it on the floor where the rats are most troublesome; then place bits of cheese, sweetmeats, &c., on the pillows and clothes; get in bed and blow out the light and lay still; the rats will soon make their appearance, and when they get fairly at work on the cheese, &c., make a grab!

A Rhode Island clergyman lately illustrated the necessity of corporeal punishment for the correction of juvenile depravity, with the remark "that a child, when once started in a course of evil conduct, was like a locomotive on the wrong track—it takes a switch to get it off."

A Southern boy being asked why he preferred to board at an extensive hotel, and give dinner parties, instead of living at home, gave as excuse that, "Pa and ma had got to be so sassy that he could stand it no longer, and so he had quit 'em!"

Sinful blessedness is a nuisance, especially during a hard frost.

IT IS NOW TIME TO PLANT!

At the Rochester Seed Store, opposite the Arcade, Buffalo Street, I can supply all kinds of Seeds, and the implements usually wanted by the farmer or gardener. I have Seeds of my own growing; also those of my own importation from England, France and Germany, which I will sell at as low rates, as can be had in this country, both at wholesale and retail.

Clover Seed.—Medium from Ohio, and the large kind grown in this county, at market prices.
Timothy Seed—from Wisconsin, at market prices.
Peas.—Large Marrowfat—Early Washington—Early Kents, (the earliest variety)—Early Prince Albert, (Imported)—Blue Imperial (Imported)—and all the other varieties worth cultivating, by the bushel or quart.
Beans,—Lima—China Red Eye, &c.
Corn—Stowell's Evergreen Sweet Corn, at 50 cents per quart.
Poland Oats—At $1.25 per bushel.
Mexican Potatoes—of my own raising, at $4 per barrel delivered at the Rail-Road.
Osage Orange—New seed, just from Texas, at $10 per bushel, or 75 cents per quart.

Orders by mail, enclosing the money, will be promptly attended to. The seeds forwarded without delay, or the money returned. JAMES P. FOOT.
Rochester, May 8, 1854. 227-21

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

Emery's Horse Powers, Threshing Machines and Separators, Circular and Crescent Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use—Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—Grass, Field and Garden Seeds, of the best imported and Shaker growth.

E. D. HALLOCK.
Warehouse and Sale Rooms No. 24 Exchange Street, Rochester, N. Y. 220-tf

"HALTON" (11,552.)

My *first premium* Short-horn Bull, Halton, will serve a few cows this season, at $10 each. Thorough bred Short-horn cows, $20 each; to be paid in advance. Cows not proving in calf, may be returned at any time within four months.

I shall have a few Short-horns for sale this summer, (male and female,) from premium animals. S. P. CHAPMAN.
Mount Pleasant Farm, Clockville, Madison Co., N. Y.
May, 1854. 220-4t-eow*

IMPORTED HORSE "CONSTERNATION,"

This well known thorough-bred horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of Youatt.

Terms—$10 the season, $15 to insure, *payable in advance in all cases.* Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No mare will be served that is either ring-boned, spavined, or blind. J. B. BURNET.
Syracuse, N. Y., May 1, 1854. 220-8w-3tm

MEXICAN AND SWEET POTATOES.

The genuine "Mexican Wild Potatoes" at 2 dollars per bushel; and Sweet Potato plants at 1 dollar per hundred, will be forwarded by railroad or express to any address, and in any desired quantities on the receipt by mail of the money or postage stamps. Give plain directions.

Address I. W. BRIGGS,
220-3t West Macedon, Wayne Co., N. Y.

EDWARD HARRISON'S PATENT GRIST MILL

Received the highest premium at the World's Fair; and more than 250 of them have been sold within two years. The stones are French Burr; the frames and hoppers, cast iron; and the spindles, cast steel. They will work both for flouring and on all kinds of grain, and will keep in repair longer than any other mill. Having just completed my new buildings, for manufacturing and running them, I am now prepared to supply all orders for all the sizes, from 20 inches to four feet diameter, including a superior farm and plantation mill, which will grind corn in the best manner, by horse-power, or even by hand. Public attention is invited to this small mill in particular. Descriptive circulars, with cuts, sent in post-paid applications.

225-71* EDWARD HARRISON, New Haven, Ct.,
Sole manufacturer, and Proprietor of the Patent.

BONE DUST.

Bone dust sawings or meal, a very superior article, warranted pure. Price, $20 per ton.

Bone dust turnings, price, ... $2,50 per barrel
Do. ground, " . . . . . $2,00 " "

No charge for package. For sale by
LONGETT & GRIFFING,
223-6t No. 25 Cliff street, New York.

PERUVIAN GUANO.

Peruvian Guano.—We are prepared to supply all orders for this valuable manure. Price, 2½ cents per lb—in particular to observe that every bag is branded, "Warranted No. 1, Peruvian Guano, imported into the United States, by F. Barreda Brothers, for the Peruvian Government."
LONGETT & GRIFFING,
223-6t No. 25 Cliff street, New York.

PREMIUM FOWLS.

I have for the last few years received the First Premium on my Brahmas and other varieties at the N. Y. State Fairs—also Monroe Co. Fair at Rochester. I now have 23 varieties for sale—and eggs for hatching. My fowls are second to none in America. All warranted to be pure in every particular, and what they are sold for.

Rochester, N. Y. 224-6t* D. P. NEWELL.

3,500 ACRES OF LAND, WITH STEAM SAW-MILL FOR SALE,

In Scioto Valley, Ohio, and lying on the Ohio Canal.—Property as desirable as this, is seldom to be met with, and will be sold at a bargain, and on accommodating terms.—Persons desirous of purchasing, by calling upon, or addressing the subscriber, at Chillicothe, Ohio, will be promptly attended to, and full description of premises given. The land will be divided into farms of 200 acres or more if desired, to suit the purchasers. H. H. HOAG.
Piketon, Pike Co., Ohio, March 23d, 1854. 221-tf

LAND PLASTER

At Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

217-4m. JIREH ROWLEY.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

The Wool Grower and Stock Register is the only American Journal devoted to the Wool and Stock Growing Interests. It contains a vast amount of *useful* and *reliable* information not given in any other work, and should be in the hands of *Every Owner of Domestic Animals*, whether located East or West, North or South.—Published monthly in octavo form, illustrated, at Only Fifty Cents a Year—3 copies for $1; 8 for $2. Vol. 6 commenced July, 1853. Subscriptions can begin with the July or January number. Back volumes furnished.

Address D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:

EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. Bixby,—H. C. White,—T. E. Wetmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete Agricultural, Literary and Family Newspaper.

☞ For Terms, &c., see last page. ☜

Rural New-Yorker.

Progress and Improvement.

SPECIAL MANURE THEORY.—NO. II.

Last week we promised to bring forth facts which militate against the commonly received opinion, that the relative proportion of ingredients in the manure should correspond with the relative proportion of the same ingredients in the crops to which they are best adapted.

In the Rural of May 13th, we copied an article from the Mark Lane Express, on the bean crop, in which, from the experience of British farmers, it was taken for granted that beans are not an exhausting crop, although they contain a very large quantity of nitrogen; and some very plausible reasons were assigned why this was the case. Without adopting the *rationale* of our able British contemporary, we may be allowed to consider its article as affording practical indications of the fact that beans, in an English course of rotation, are not an exhaustive crop, and which is tantamount to saying that they are not large consumers of nitrogen. Peas and tares are also exceedingly nitrogenous, and British agriculture clearly shows that they abstract from the soil only a relatively small quantity of nitrogen. But we are not left simply to the teachings of practical agriculture in this matter. In a long-continued and extensive series of experiments on the Rothamsted farm, (the results of these experiments have not yet been published, so that we do not feel at liberty to give the figures in this connection,) it was shown that on soil similar to that on which an application of ammonia (nitrogen) gave a great increase of wheat, an application of ammonia in a variety of forms and combinations had little or no beneficial effect on beans, peas and tares, all of which are eminently nitrogenous, while wheat is eminently non-nitrogenous or carbonaceous—a result just the reverse of what the special manure theory would lead us to suppose.

Again, the ash of wheat contains, say 50 per cent. of phosphoric acid, and the ash of turnips 10 per cent. Eleven years ago, Mr. Laives set apart thirteen acres of land for a continuous series of experiments on wheat, and about eight acres of *similar soil* for a continuous series of turnip experiments. One plot in each has been kept every year since without any manure, while the others have been supplied with natural and various artificial manures.—The first year the no-manure wheat plot yielded sixteen bushels per acre; the no-manure turnip plot produced 4 tons 3 cwt. The second year (a wet, growing season,) the same wheat plot yielded twenty-three bushels per acre, and the same turnip plot produced 2 tons 4 cwt. The third year the same wheat plot yielded 17¾ bushels, and the same turnip plot 13 cwt. per acre. The fourth year the same wheat plot yielded 16¾ bushels, and the same turnip plot, turnips no larger than small gooseberries. During ten successive years the plot of unmanured wheat has averaged, we believe, some 16 bushels per acre, while the turnip plot has refused to produce turnips without manure.

Now taking the analysis of the turnip as a guide, it is perfectly evident that the soil contained sufficient phosphoric acid, potash, and, indeed, of all the mineral elements of plants, for the production of a very large crop of turnips; for not only did it produce for ten successive years 16 bushels of wheat and straw per acre, without manure, but when supplied with ammonia *alone* it produced even much larger crops, showing that there was a very large quantity of mineral matter in the soil.—But why would it not produce turnips? On other plots of the turnip field, ammonia, potash, soda, lime, magnesia, sulphuric acid, muriatic acid, chlorine, and carbonaceous matter (oil and rice,) were all used in a variety of combinations, but without any material increase. It is plain, therefore, that it was not from a lack of any of these. *On the plots where available phosphoric acid (superphosphate of lime) was used, large crops were produced,*—and this not for one year or two years, but throughout the whole ten years' series of experiments. There can, therefore, be no doubt that for the production of a crop of turnips a much larger quantity of phosphoric acid is required, in an available condition in the soil, than is required for a crop of wheat. Could those who are skeptical on this point have watched these experiments, as we did, and seen on one plot a luxuriant crop of wheat of 30 bushels per acre, without phosphoric acid or anything except ammonia—and on another similar plot, without phosphoric acid, a crop of turnips no larger than small radishes—and on a plot adjoining, where phosphoric acid was applied, a magnificent crop of turnips—they would be convinced that though wheat contains five times as much phosphoric acid as turnips, yet that turnips require for their growth a much larger quantity of phosphoric acid, in an available condition in the soil, than wheat.

We could refer to other facts which are at variance with the special manure theory, but we think it unnecessary to do so. We may just add, that while thousands of tons of superphosphate are annually used in England for the turnip crop, it is never used, in common agriculture, as a manure for wheat, barley, oats, or the cereal grasses, all of which contain a large quantity of phosphoric acid.

We have shown, therefore, from experiments, the accuracy of which none can question, that for the highly nitrogenous beans, peas and tares, nitrogen is not required as a manure; that for the highly carbonaceous wheat, carbonaceous manures are not required, (at least, whether we have shown it or not, it is the case,) while nitrogen in large quantities is indispensable; and that for turnips, which contain a large quantity of potash and little phosphoric acid, potash does little good while the application of phosphoric acid is most eminently beneficial; and finally, that wheat, which contains a large quantity of phosphoric acid, on a soil which for lack of it would not produce turnips, is not benefited by applying phosphoric acid.

SEWERAGE.—HOW AVAILABLE.

Dr. Anderson, Chemist to the Highland Agricultural Society, has an article in the March number of the *Journal of Agriculture*, "On the mode in which the Sewerage of Towns may be most profitably used as a Manure." The most valuable constituents of any manure are ammonia, phosphoric acid and potash. In sewerage water, the phosphoric acid is held in *suspension*, and the ammonia and potash in *solution*. When the sewerage water is left at rest, the phosphoric acid is deposited as sediment, while the ammonia and potash remain dissolved in a more or less clear fluid. Dr. Anderson found that 10,000 gallons of the Edinburgh sewerage contained 11 lbs. ammonia, 8½ lbs. phosphoric acid, and 4 lbs. potash; while an equal quantity of the sewerage of the Morningside Lunatic Asylum contained only 4¼ lbs. of ammonia, 3½ lbs. phosphoric acid, and 2 lbs. potash. Dr. Anderson estimates the value of the ammonia at 12 cents; the phosphoric acid at 3 cents, and the potash at 4½ cents per lb. "From this it appears that little more than one-sixth of the whole value is contained in the insoluble parts of the sewerage, the other five-sixths existing in solution; and it is therefore obvious, that unless the plans by which sewerage water is to be rendered available, make use of that part which exists in solution, they must be of little value."

Dr. Anderson then reviews at length the various processes that have been recommended for the purpose. Filtration he pronounces "*radically bad*," as by calculation, from the rich Edinburgh sewerage, it appears that 40,000 gallons would have to be passed through the filters to obtain a quantity of valuable matter equivalent to 100 lbs. Saldanha Bay guano, or, we may add, to 100 lbs. of calcined bones, animal charcoal, Mexican guano, &c.—Filtration through *absorbent matters*, such as peat, charcoal, sawdust, spent tan, and burnt clay, he considers impracticable. Even granting all that is claimed for them, "they would add so much to the bulk and weight of the product as completely to counterbalance any advantage produced by their slight absorbent quality." *Precipitation* is a favorite method with certain theorists. This Dr. Anderson declares economically inapplicable; and furthermore, "even granting that *all* the valuable matter was deposited by means of certain substances added, all is not yet done; the matter is left at the bottom of the tanks in the form of a wet sludge, which could not be lifted with spades, and would require some process of artificial drying."

After all that has been said and written on this subject, after the immense amount of money and time which have been spent in scientific and practical experiments, with a view to render the sewerage of cities available, it is melancholy thus to be obliged to conclude that we are practically, no farther advanced in the manufacture of good, cheap and portable poudrette, than we were a quarter-century ago. Yet such appears to be the fact. The plan of conveying the liquid manure through pipes and dispersing it by means of a hose, as adopted by Mechi, and some few others, would seem to be the only means available in the case.—In regard to this method, Dr. Anderson says:—"I have no hesitation in expressing my opinion that, if it is to be rendered available in any way, it must be by this. It is clearly on this system only that all the valuable matter can be turned into account, and that *in the form most suitable to the plant*. The whole thing, as most commonly occurs in such cases, resolves itself into a money question—Can sewerage water be profitably applied by means of pipes, (for it is manifestly pipes, and not open drains which must be employed) or can it not? For my own part, I think that pipes, judiciously applied, might prove successful."

If such a system is found profitable in Great Britain, we have no doubt that it will be at least equally profitable in the dry, hot climate of America; for hay, milk, potatoes and many other farm products, command higher prices in our large cities than they do in England, and the amount of labor required in the distribution of the liquid after the mixtures are laid down is very small. We believe, therefore, that a judicious system of irrigation will pay better here than in Great Britain. We are not to be understood, however, as asserting that it will, at present, *pay*, in either country. It is a question which practical men can alone determine,—unfortunately the experiments of such enthusiasts as Mechi, are not always reliable.

Plaster on Peas.—Twenty years ago I sowed to peas about an acre of land, one half of which was a deep sandy loam, the other rather shallow and stony. When the peas were from six to eight inches high, I sowed plaster at the rate of nearly two bushels per acre, on the sandy knoll, it being in a low state and the peas turning yellow, while those on the other looked green and healthy. Two weeks from this time there was a marked change in favor of the plaster, and the peas continued to grow much more luxuriantly throughout the season, and I had green peas from them full one week after those on the unplastered soil had been dry, although they were all sown the same day, in the same field, side by side. I measured vines from the plastered soil seven feet and a half long, while the longest I could find on the unplastered was not over five feet, and it was remarked by a number of persons who saw them, that the pods were longer and thicker on the plastered vines. THE GRAINS AND GRASSES.—NO. IV.

Barley—(*Hordium Vulgare.*)

Barley is found in the natural order Gramineæ, and may be divided into two kinds, the two-rowed and six-rowed, and these comprehend the common, the naked or Hordium Nudum, and the battle-door kinds. Lawson describes twenty varieties, and specimens of thirty varieties are deposited in the Museum of the Highland Agricultural Society of Scotland. If we classify barley by the ear, it is evidently of three varieties, viz., the two-rowed, four-rowed and six-rowed. The six-rowed is the most common kind cultivated in Western New York, and brings generally two or three cents more per bushel than the two-rowed, from the fact that it malts better; but the two-rowed is said to produce as well, and in many sections is coming into extensive cultivation to the exclusion of the other kinds. This is also true in England and parts of Scotland. The two-rowed has larger and plumber kernels—has larger and stiffer straw,—is not as liable to injury from wet, and is from two to four weeks later in ripening than the other kinds. These traits recommend it to those who grow wheat, as it can be left till after wheat harvest. It is not as essential to sow the two-rowed early as it is the four or six-rowed. In England and Scotland, amongst the best farmers, it is a common practice to change the seed, getting that which was grown on heavy soil to sow on light, and that which was grown on light to sow on heavy, with good effect.

Winter or square barley is a hardy variety standing cold well. It has its grains in six rows. There is also a two-rowed variety raised in the South of England, with very thin skin, and much esteemed for malting. They also raise a kind called sprat or battle-door, from the shape of the seeds; this is a two-rowed kind. The Hordium Nudum or naked barley, was much cultivated some time ago in parts of England, but has been given up. In this variety the chaff comes off in threshing, and the naked grains are like wheat, and weigh as much. Hordium Zeocriton is a variety having very short beards, and is sometimes called beardless barley.

In choosing seed barley, select that which is of a lively color, free from blackness at the germ end, and if it appears shriveled it is a good sign, as it shows a thin skin. The thick skinned may appear plump, while the flour may be small and shrunken within. Barley seed, should be frequently changed from a lighter to a heavier soil, and vice versa. Barley may be much improved by care in selecting seed, and new varieties obtained by crossing.

It is known that if a succession of grain crops are raised on the same land, that as a general thing the crop deteriorates; and if it is the same kind of grain, this deterioration takes place so much the sooner. The reason of this is that the soil being composed of various ingredients, some one or more of them becomes exhausted, or if the soil yet contains a supply it is not in a condition to be used by the plants hence it is necessary to have a rotation of crops, or to supply the lacking ingredients to the soil. The analysis of the crops raised and of the soil on which it is grown, if accurate, will show what should be supplied in order to grow the same crop on the same soil for any length of time. This analysis would inform us where and how to apply our manures in the most successful manner and with the best economy. Barley has received as much attention from chemists as any of the grains, and is found to consist of the following elements, according to Boussingault: Earthy phosphates ·325, phosphates of potash ·092, sulphate of potash ·015, chloride of potash .003, carbonate of potash ·180, silica ·355, and loss together with traces of some two or three other ingredients, ·030 in each 1000 parts. From this it will be observed that barley is rich in phosphates and potash, and one of the best manures to be applied to the soil is unleached ashes, together with well decomposed manure that is rich in azote or nitrogen. Barley straw is composed of earthy phosphates ·078, phosphate of potash ·003, sulphate of potash ·035, chloride of potash ·005, carbonate of potash ·160, earthy carbonates ·125, silica ·355, loss ·022. The quantity of ash when compared with the straw is as 42 pounds to 1000, and of the grain as 18 to 1000. The quantity of mineral ingredients removed from an acre by a good crop of barley is nearly, in pounds, as follows:—Silica 107, phosphoric acid 24, sulphuric acid 4, lime 16, magnesia 9, potash 38, soda 3, chloride of sodium 7, chloride of potassium 1. From this it appears that barley in fact removes a larger amount of mineral ingredients than the oats, and though generally considered a light crop on land, it would not long succeed on soils that are not rich in both mineral and azotized elements. I. A. Clark.

Marion, Wayne County, N. Y.

UNDERDRAINING TO KILL QUACK GRASS.

Eds. Rural:—If the Rural ever advised a farmer troubled with Quack Grass to sell out at night and abandon the home of long years of weary labors, (as alluded to by your correspondent, Mr. Johnson,) let me say there is hope in his case, for Quack grass can be extirpated by perseverance, and that too without subjecting every poor farmer to the expense of draining his land. Of the beneficial effects of underdraining there can be no doubt, but that it is absolutely necessary that it should be performed before there is hope of success in killing the Quack, is, in my experience, a mistake. It is true the land is in better condition for any crop which may be put on it, yet the underdraining of wet land, or of any condition of land, be it ever so dry naturally, will not avail much in getting rid of this grass, by the summer fallowing process, if the season should be one of continued rains and wet; but if it be a dry season, great hopes may be entertained of making a wholesale business of it.

I will just state the process how success, in my case, proved almost a complete triumph.—The ground was nicely turned over at the commencement of dry weather, thoroughly rolled and left a few days to settle, so that it could be cross-plowed the next time without turning it up in long pieces. It should be plowed the second time with rather a narrow furrow, making the pieces as small as possible. Then every dry time during the summer, harrow the ground, and my word for it, you will give it a death-blow.

Friend Johnson, at the close of his article on Quack grass, asks if there is any man in the State of New York who has ever seen Quack grass or wild Mustard growing on dry soil. I can respond to his interrogatory and assure him and all others that it flourishes best in light, sandy soil. I have abundant evidence on my own sandy farm, of its running at a fearful rate.

Mr. Moore, facts are "stubborn things," and I think you will join with me in pronouncing the strongest condemnation on the man that would prove himself so reckless as to place a handful of Quack grass roots in his neighbor's premises, though it be on top of a stump, held down by a heavy stone.

As showing the wonderful tenacity Quack grass has for life, I will mention a circumstance that transpired under my own observation.—In the spring of the year I placed on an old oak stump a handful of Quack grass roots, and there the same remained till the next spring, when passing near that part of the field, my attention was attracted by a very green mound on top of the stump, and to my utter astonishment I found it quackery. H. N. L.

Rochester, N. Y., May, 1854.

Terra Culture.—A correspondent of the *Country Gentleman*, who was last year initiated into the mysteries of terra culture, sowed a field of oats and grass seed, and planted some young apple trees on the terra culture plan.—"The crop of oats was not so good as I had reason to expect from the land, and the grass seed was an entire failure. The apple trees were watered and weeded, but one-half died in spite of me."

Clay is now proved to be the best means of retaining manure. Sewerage water filtered through it comes out destitute of smell, and what is better, minus the valuable salts of ammonia, alkaline phosphates, and other soluble fertilizers, which are retained by the clay.

VISIT TO MOUNT PLEASANT FARM.

Eds. Rural:—A few days since I called on Mr. S. F. Chapman, Mount Pleasant Farm, Clockville, Madison Co., N. Y., for the purpose of examining his celebrated herd of "Short Horns." I found Mr. Chapman a gentleman, in the true sense of the term. His intelligence and hospitality rendered my visit exceedingly satisfactory. He has on hand fifteen thorough bred cattle, and expects five more calves. They are all red and white or red roan, except one, ("Dutchess") which is a beautiful cream color. Mr. Chapman, and Mr. Vail, of Troy, imported from England, last season, four Bate's heifers from the herd of Robert Bell, Esq. I have never before seen so many imported heifers together, and can truly say that I never saw a herd of such perfection of form and uniformity of appearance.

Like the far-famed "Bakewell" sheep, in their peculiar formation and distinctive features, the Bates' stock exhibit traces of high breeding, which cannot be too highly appreciated by such as are wishing to obtain animals of undoubted purity of blood. It would be difficult to particularize where so much uniformity exists.

To my notion, Mr. C.'s "Ruby's" were not in any essential particular inferior to his imported stock, and it is my impression if I could have a selection out of the herd, I should take one of Mr. C.'s own raising. His cow "Charlotte," although having the misfortune to have her hip dislocated at the Fair, last fall, exhibits a gracefulness and majesty rarely to be met with in an animal of so great weight. Her portrait, (although it does not do her justice) is so often seen in books that a description is unnecessary.

His prize bull "Hallon," has a symmetry of form, a richness of color, an ease and gracefulness of motion, and a dignity of carriage joined to his great weight and extra handling qualities, that I never saw excelled.

I was somewhat disappointed, as I expected to find a herd of fat cattle. With the exception of "Dutchess" and "Hallon," they were only in fair condition, and I saw other herds that I think eat more grain than Mr. C.'s.

He has also a fine pair of Berkshire pigs from the stock of L. G. Morris, Esq., from imported stock on both sides. They are beautiful specimens of their race. He has also nine different breeds of fowls, including the celebrated Brahma Pootras, and is making arrangements to import hens direct from China the present year. As he has a friend who has during a long season resided in that country who will select for him, his opportunities for procuring the best cannot well be surpassed. As a climax to his poultry yard, he has two kinds of fancy pigeons,—the Ruffle Necks and Fan Tails.

It has been said that "he who makes two spires of grass grow where but one grew before is a public benefactor;" and shall the same need be withheld from him who spends time and money to introduce stock many times more valuable than that heretofore obtained? As we judge of almost every object by comparison, I would advise all who are wishing to obtain superior animals or fowls, to give Mr. Chapman a call, and if their entertainment is as agreeable as mine was, they will not regret it.

D. W. Palmer.

Clinton, Lenawee Co., Mich., May 15th, 1854.

CULTIVATION OF FLAX.

Eds. Rural:—Being a constant reader of your valuable paper, I noticed a week or two since, an inquiry respecting raising flax, and your remarks upon it. Having formerly had considerable experience, and living in a neighborhood that for many years probably produced more and better flax than any other place in the State, of the same dimensions, I thought I would forward a few remarks, although perhaps too late to be acted on this season. Our experience here leads to somewhat different management from that you suggest.

The year previous to sowing flax, we select a clean piece of soil, the older the better generally, and cultivate in corn, manuring if not rich enough, and being particular to dress it very clean, leaving neither weeds nor grass.—The following spring plow as early as the soil will permit, and pulverize thoroughly; when in order, level with a harrow, sow on the seed and cover with a light thick brush. The seed should be very clean and plump. It is well to soak it and roll in plaster or lime, or both, and use from one to two bushels per acre, according to the strength of the soil and the purpose it is planted for. From three to twelve bushels of ashes per acre at the time of sowing, are very beneficial. The earlier sown generally has the most and best coat or fibre, but sometimes not as much bulk.

The cultivation is, however, almost entirely given up hereabouts, not because it is not a remunerating crop, when well managed, but the labor after sowing, is all of it very exhausting and disagreeable, and when persons can obtain good wages at more pleasant labor, they will not work at it, and I for one do not blame them. It is true, some part of it is of late done by machinery, but with more or less waste, according to the state of the fibre; and besides, it is a crop that requires great attention to keep it straight and even, and is more liable to waste from careless handling and inexperience, than any other.

You say 400 lbs. of flax to the acre is a good crop—I think 300 is good, and that the average on good soils, one year with another, will not exceed 250 lbs. and eight bushels of seed, though crops have been raised to reach as high as 500 to 600 lbs. to the acre and 15 bushels of seed. The greatest quantity of seed, however, generally accompanies the less or medium yield of fibre.

Your correspondent has here the results of many year's experience and hard labor, and if he and others feel disposed to stretch their backs in pulling, whipping and spreading flax for a livelihood, we wish them all joy and success.

H.

Watertown, Litchfield Co., Conn., May, 1854.

MARL,—AGAIN.

Messrs. Editors:—Since my former article, which appeared in the Rural of March 18th, on the subject of marl, I have received several letters of inquiry from individuals, asking for information as to the *best* mode of constructing kilns for burning it into lime, its value as a fertilizer, &c. With your permission, I will answer all through the columns of the Rural.

A kiln, to be durable, should be made entirely of brick, but in localities where fire-proof stone can be obtained, they will answer, by being lined with brick. It should be built small, capable of holding only about 200 or 300 bushels; can be built square or round, with *one* arch, to extend entirely *through* the kiln from side to side, thus making two mouths, one on each side.

After the marl has been moulded into brick, and *all dried*, the kiln can be filled, taking care to lay them neatly and regularly. Commence burning with one mouth of the arch *closed*. After burning eighteen or twenty hours, change the fire to the other mouth, and close the one first used. Ordinarily thirty-six hours only is required to make ready for market a most splendid article of lime. If any one wishes to drive the business energetically, let him build two kilns, and while one is burning make ready the other, in the same manner as the first.

In regard to its value as a fertilizer, several letters from men in Western New York and Pennsylvania, as well as Michigan, have been received, asking for information as to the best manner of applying marl to the soil in its raw or natural state. It seems that some have applied it to their soil, but could discover no beneficial effects. To such I would say: your soil is rich enough, or else it is already strongly impregnated with lime, probably the latter, and a fertilizer of a different nature is required.

Probably the best mode of applying it to poor land, is to cart it on in the fall or winter, as the action of the frost benefits it, by slackening and rendering it perfectly fine. In limestone sections, a large proportion of muck mixed with the marl, will perhaps prove better than all of either. On grass lands, it can be spread when first carted. This too should be done in the fall, and a light harrowing in the spring will prove beneficial. Clover is greatly benefited by an application of marl, more especially after one year's growth. After being burnt, marl can be used in all cases, the same as common stone-lime.

If I have not answered all inquiries, I will do so to the best of my ability, on being informed.

Burlington, Calhoun Co., Mich. M. J. Strong.

ASHES FOR CORN.

I have found, by experiment, that ashes are to be preferred to plaster for corn. Last year I planted a few acres of corn upon a patch of ground that I did not consider strong enough to produce a large crop without some artificial manure. I had a few bushels of plaster which I put upon the corn as far as it would go. I then skipped a few rows, and upon the remainder put unleached ashes (a small handful to the hill.) The result was, that the corn upon which I put nothing was not so good as that upon which I put plaster, and that upon which I put plaster not as good as that on which I put ashes. As the soil was as nearly alike as possible, the same quality of seed planted at the same time, receiving the same care, I can account for the difference in no other way than by reasoning that plaster is better than nothing, and ashes better than plaster.

O. L. B.

Fillmore, May 10th, 1854.

Large Turnip.—Mr. Charles W. Thompson, of Topsham, has sent us a monster turnip, the weight of which, with top, when gathered, was 34½ pounds, the top weighing 10 pounds. Its present weight is only a few ounces short of 20 pounds, having shrunk about five pounds in weight since it was pulled. It girts 31 inches, and stands 17½ inches, "in its stockings."—*Maine Farmer.*

Agricultural Miscellany.

NEATNESS AND ORDER IN FARMING.

Neat be your farms; 'tis long confessed
The neatest farmers are the best,
Each bog and marsh industrious drain,
Nor let vile bulks deform the plain;
No bushes on your headlands grow,
Nor briers a slovenly culture show.
Neat be your barns, your houses neat,
Your doors be clean, your houses neat,
No moss the shelterjug roof enshroud,
No wooden panes the window cloud,
No filthy kennels foully flow,
Nor weeds with rankling poison grow;
But shades expand, and fruit trees bloom,
And flowering shrubs exhale perfume.
With pails, your garden circle round;
Defend, enrich, and clean the ground;
Prize high this pleasing, useful road,
And fill with vegetable good.

Let order o'er your time preside,
And method all your business guide.
Early begin and end your toil,
Nor let your tasks your hands embroil;
One thing at once be still begun,
Contrived, resolved, pursued and done.
Hire not for what yourselves can do;
And send not when yourselves can go;
Nor till to-morrow's light delay
What might as well be done to-day
By steady efforts all soon thrive,
And long by moderate labor live;
While eager toil and anxious care,
Health, strength, and peace, and life impair.

Nor think a life of toil severe;
No life has blessings so sincere:
Its meals so luscious, sleep so sweet,
Such vigorous limbs, such health complete;
No mind so active, brisk and gay
As his who toils the livelong day.
A life of sloth drags hardly on;
Suns set too late and rise too soon.
Youth, manhood, age, all linger slow
To him who nothing has to do.
The drone, a nuisance to the hive,
Stays, but can scarce be said to live;
And well the bees, those judges wise,
Plague, chase, and sting him till he dies.

TRY THE EXPERIMENT.

A recent number of the *Granite Farmer*, quotes an experiment from the Rhode Island Agricultural Transactions, in which Mr. S. B. Halliday, of Providence, himself a dealer in artificial manures, used six bushels of salt, and 500 lbs. of Mapes' improved superphosphate of lime per acre, and obtained 160 bushels of potatoes per acre on land which "was in nothing more than tolerable heart." This is a great triumph for Mapes' manure, and the *Farmer* exultingly says:—"Now if such cultivation will produce such results, we advise our farmers to adopt it. * * We advise our readers to *try the experiment.* * * If special manures produce such results, it is high time all our farmers knew the fact—as there must be advantage and profit in their use."

We will just add for the benefit of any of our New Hampshire readers who may wish to "try the experiment," that superphosphate can be had by application at the *Granite Farmer* office, at the exceedingly *low price* of $70 per ton. So, at least, we learn from a standing editorial notice in the *Farmer*. Everything is convenient, friends; just hand over the $70 and "try the experiment." It is true that in Mr. Halliday's trial, we are not informed how much the soil produced without manure, and that 160 bushels of potatoes per acre is not the largest crop on record, yet, "try the experiment," for if you don't make money by it, Mapes and his agents will. It might be well to observe that *we have* repeatedly tried the experiment, and can confidently assert that, with a *good* superphosphate at the reasonable price of $30 per ton, the increase, *in no case, paid the cost of the manure*, and generally the superphosphate did no good on potatoes.

Great Corn Crop.—One of our English exchanges, the *Farmers' Herald*, copied a short article, with this heading, from the Rural.—Whereupon, one of its correspondents, who has "lived in a great corn district for 30 years," declares his firm conviction that some great mistake has been made, and that so much corn never grew on an acre of land. Will the *Herald* please inform its correspondent, that we, here in the backwoods of America, do not, as he does, call *wheat*, corn. By corn, is meant Indian corn—*zea maize*. One hundred bushels per acre, is not a very uncommon crop, and there are well authenticated instances where 160 bushels per acre have been obtained.

By the by, will the editor of the *Herald* oblige us by sending us another copy of his paper, directed to "Wool Grower," Darien, Genesee Co., N. Y., U. S.

New York State Fair.—In consequence of the State Fair being held in New York, the American Institute will hold no fair the present year. They will hold a fair in connection with the State Fair, and will appropriate $1,900 to be expended in premiums, one-half of which is to be paid back to them out of the receipts of the fair.

The common Council of New York, tendered the Society the use of Hamilton Square, containing 18 acres. The committee appointed to examine the grounds, have reported favorably, and the fair will be held there on the 3d, 4th, 5th and 6th of October.

SUCKERING CORN.

G. Blight Browne, Esq., in an excellent article in the Plough, Loom, and Anvil, on the history and growth of Indian corn, concludes as follows with respect to suckering:

Suckers (properly speaking) take rise from the stalk below the ground, and are capable under some circumstances to become complete plants, producing stalk, tassel and silk; and, no doubt, if the climate would favor the enterprise, would bear ears. In the natural climate of the maize, grown on a soil undrained of its fertility by husbandry, and in the natural state, unimproved by cultivation and art, it may be able to furnish to the sucker, or second growth, sufficient nutriment to bring it to maturity. But in our climate, and limited by one short season, no such result must be expected. Maize has been by cultivation much enlarged in the grain, and a greater number of grains are found on the cob of our cultivated varieties, than originally grew on the natural plant. The great desideratum of the Northern farmer is to make his corn in the allotted time, and to have his crop well matured before our early frosts. We have usually no time to lose, and there can be no doubt that any treatment which would retard the maturing of the ear, would not be a good one.

Shoots from the nodes above ground cannot do much, if any harm, to the plants, because they are soon arrested in their growth. The stripping of these shoots will occasion a repetition around, and is calculated to do more injury than good.

The case is very different with the underground shoots or suckers. They derive their sap from the roots of the parent plant, and consequently divert the supply, at a moment when it is most needed to assist in procreation, then going on in the parent plant. Nothing should be allowed to interfere with this function, as the early maturing of the seed depends on the vigor with which this process is prosecuted.

Therefore, on the whole, I should conclude that the shoots or suckers which start from the nodes above ground, should not be removed; and those which have their origin below ground should be removed.

STEEPING SEEDS.

Soaking seeds in liquids before planting them, has been practiced with more or less advantage. Germination may be considerably hastened simply by immersing the seed twenty-four hours in water at a temperature of sixty-five to seventy degrees. By this means a crop may be forwarded in growth several days.—Where seeding has been delayed a gain may thus be effected of no small consequence.—When the soil is in a moist state, the soaked seed will come up with as much certainty as if put in the ground dry; but if the soil is very dry, there is a risk with seed in which germination has commenced. The dry earth may absorb the moisture of the seed, thus causing a shrinkage which weakens or destroys its vitality. We should therefore be cautious about soaking seeds in time of severe drouth.

But other advantages have been claimed in regard to soaking seeds. It has been held that the growth of crops may be stimulated and the final yield increased by steeping seeds in solutions of various substances. This subject received much attention several years ago. Some persons carried the idea so far as to claim that seeds could be so *doctored* that bountiful crops might be produced without any other manure, even in the most sterile soil. Different kinds of *steeps* were invented, and quacks and charlatans sold the recipes for making them to people who had more credulity than judgment.

The substances chiefly employed for this purpose were nitrate of soda, nitrate of potash (salt petre,) muriate of ammonia (sal ammoniac,) sulphate of ammonia, &c. Ammonical liquor, which is produced by the distillation of coal in the manufacture of gas, has also been used as a steep for seeds. Hannam, in his Essay on Waste manures, describes this liquid as "an impure solution of the carbonate of ammonia and is the very gas which is evolved during the decomposition of animal substances, and which escapes from our manure-heaps during fermentation." The results of soaking seeds in this liquor, have sometimes been highly favorable. A gentleman who made some experiments with it, ten years since, stated to the writer that corn and oats soaked in the liquor thirty hours before planting, showed a broader and greener leaf, produced larger heads and ears, and yielded twenty per cent. more than that with no application—the treatment being in all other respects similar.

The effect of all these substances, however, appears to have been various, and to have been governed in some instances by unknown causes. In general, the preference after repeated trials, was given to muriate of ammonia. Indian corn appeared to derive considerable advantage from a solution prepared nearly as follows:

An ounce of muriate of ammonia is dissolved in sufficient water to cover a quart of corn—the corn to remain in the solution twenty-four to thirty-six hours, at a temperature of sixty-five degrees.

When planted, it may be "dried off" by mixing plaster or dry sand with it till the grains will readily separate, either in dropping by hand or with a seed drill. As it is advisable in all cases to ascertain the precise result in any experiment, the prepared seed might be planted in alternate rows, or lots of the same extent with others to which the solution was not applied—the soil and cultivation being as nearly alike as possible. Let the product of the different lots be carefully weighed and compared, and the result will indicate the value of the solution.—*Boston Cultivator.*

Practical Hints.—Never allow ashes to be taken up in wood, or put into wood. Always have your matches and lamp ready for use in case of sudden alarm. Have important papers all together, where you can lay your hand on them at once, in case of fire.

FARMING PROSPECTS.

The warm sunshine of this week, especially of Tuesday, acting upon a soil saturated with warm rains, has given a sudden impulse to vegetation in this quarter, so that the change from bare boughs to green foliage is almost magical. Yet, as every season in its turn is said to present some features unparalleled in the memory of "the oldest inhabitant," so we do not remember a predecessor so backward, up to the middle of May, as this of 1854. The Apple-tree, in Westchester county, was not fairly in blossom before the 14th or 15th of May, which is the average of its blossoming in Massachusetts; the peach was a few days earlier. There will have been more oats sown this year between our city and the Highlands after the 8th of may than before—a fact unprecedented since 1836. On the 15th of May, not half the grass land hereabouts destined to bear Indian Corn this season had yet been broken up—and there will be much yet unplanted on the 25th. Fifty miles above our City, the rain of the 15th was accompanied by hail, which did much damage to the blossoming fruit. The earth is still saturated with water, rendering the plowing of moist land difficult and not very effective.

Farmers who have yet to plant or sow grain ought to soak their seed to the verge of sprouting,—(if Indian corn, two or three ounces of nitre dissolved in each pailful of soaking water is said to be excellent)—roll dry in plaster, and plant immediately. Guano, phosphate, superphosphate, poudrette, and other stimulating manures, should be applied to hasten and increase the growth of the crops.—*N. Y. Tribune.*

SMUT IN WHEAT.

George H. Northam gives in the *Southern Planter*, the following account of experiments made by him in regard to the prevention of smut in wheat:

Lot No. 1. One bushel of wheat sowed without either brining or liming, with one hundred and fifty pounds of Peruvian guano to the acre. The yield, thirteen bushels, half the smut very bad.

Lot No. 2. One bushel, brined and limed, and sowed with one hundred and fifty pounds of Peruvian guano. Yield, fifteen bushels per acre. This lot had some little smut, but nothing like as bad as No. 1, which I think lost two bushels in smut.

Lot No. 3. One bushel brined, but not limed, and sowed with one hundred and fifty pounds of Peruvian guano. Yield, ten bushels. About one-third of this lot was smut.

Lot No. 4. One bushel washed in clear spring water, and then limed, sowed with one hundred and fifty pounds of guano. Yield, eighteen bushels. This did not have the smut at all.

On all these lots the wheat was the same; the growth equally vigorous on them all.—The result of my experiments is, as will be seen, in favor of the lime. The spring water was only used to wet the grains in order to make the lime adhere to them.

To keep Worms from Seed Corn.—To prevent worms from eating into seed corn after it is planted is almost a hopeless task; and the remedy that one man finds serviceable, another will tell you has no effect. Corn steeped in moderately strong tobacco water, and then rolled in plaster before planting, has been found to suffer but little from the cut worm.—Some have tried tarring their seed, or steeping it for a short time in tar water, and then rolling it in plaster. In using tar, care must be taken not to let the water be strong enough to injure the vitality of the seed, which it will do. The mere odor of the tar on the seed is sufficient to keep the worms off.—*Mich. Farmer.*

Inquiries and Answers.

Black Paint.—Please inform me what are the ingredients of Black Paint, and also the manner of mixing.—G. W. A., *Murray, N. Y.*

The ingredients of black paint, are lamp-black, linseed oil, Japan and spirits of turpentine. The relative proportions of the ingredients depends much on the purpose the paint is desired for. On out-door work, the proportions usually are two thirds oil, and one third spirits of turpentine, or sometimes oil alone is used. For in-doors, there must be a greater proportion of spirits of turpentine, say half boiled oil, and half spirits of turpentine. For fine work, add a tenth to a twentieth part of Japan. It causes the paint to dry quicker, and gives the work a harder and better finish.

It is somewhat difficult to mix. Stir it up thoroughly in a thick state, thinning it afterwards as you require. For fine work, it should be ground on a stone or in a paint mill.

Osage Orange.—Will you please to give me some information about the cultivation of Osage Orange seed? how to be planted, &c.? I sent for and received a package of seed from Rochester without any direction for culture.—W. H., *York, N. Y., May 16th.*

The seed should be soaked for at least ten days or a fortnight before planting. Soft water is best, and it should be changed every day. While the seeds are soaking, will not some of our correspondents give our friend a few practical hints on the subject of his inquiry?

Wheel Hoe for Onions.—I should like to learn if there is anything at Rochester in the shape of a wheel hoe for weeding onions or root crops, to be used either by horse or hand power?—H. N. Hand, *Jeddo, N. Y.*

We can find no hoe of this description in Rochester.

Orchard and Garden.

THE PEACH.—NO. II.

In connection with this protection by means of fences, is another consideration, and one that may aid it much, and that is the mode of training. Low heads and training by shortening in, find now almost universal favor among scientific men. The low tree is certainly the best for all purposes, and especially so in a windy country. And more so must it be with the peach, when it can be made to aid incidentally, in its own protection against frosts. Allusion is now made, not so much to the prevention of activity in the sap, as to securing against injury after the sap is in full circulation.

It is well known that damage from frost is much greater when the plant is exposed at once to the direct rays of the sun, or to a considerable degree of heat, than when the thawing is accomplished gradually in the shade. I have seen growing corn so frozen, that the least disturbance of a leaf would break it like glass, saved from injury by being enveloped in a dense fog at sunrise. Vines so shaded that the sun could not reach them till the frost was dissolved by the softening of the atmosphere in general, have remained fresh, while others no less frozen were killed. Now, apply these principles to the peach orchard, and it will be seen that it is most desirable to train our trees so that they can be easily shaded.

The late treatises on fruit culture, give ample instructions on this mode of training, and he who cultivates but a half dozen trees, would find himself more than paid in the purchase and study of one of them. In an article like this, we can no more than indicate some of the principal points, for the benefit of those who raise their own peach trees, as perhaps most people do—especially in a new country. The work must be begun when the tree is small.—If seedlings, when one year old; if budded, at one year's growth of the bud—the bud having been inserted close at the ground. And having begun, the work must be followed up and carried out, or it will prove worse than useless. The form must be fixed in the mind, and sight never lost of it. Suppose the tree to consist of a single stem. It must be cut back to such a point as we wish, for the base of our top which we prefer at about one foot and a half from the ground. This should be done in the spring before growth commences. Select from the shoots that start nearest the top of the stem, three or four only, and pinch off all the rest as they start. These, it should be remembered, are to become large and form the basis of the top, and they should be chosen with reference to preserving a proper balance of the tree. It may be necessary to fasten them to stakes to give them the proper inclination.—Care should be taken also, as with all other branches, that the union with the parent stem shall be smooth and solid, with no overgrowing of the bark, form a crotch to collect moisture to rot the wood. Such branches, beside, are weak, and break or split with the first load of fruit.

For after treatment, we must keep the model form always in mind, and watch constantly to pinch off all shoots not wanted to fill out our design, and to check by pinching those that are gaining undue prominence. Shortening in the ends of all the branches in the spring, will induce the buds near the base to develop themselves, and so fill the whole tree with bearing wood. Let the practiced man consider these thoughts of Mr. Wylie, and he may perhaps benefit himself very much. T. E. W.

HINTS AND GLEANINGS.

Depth vs. Drouth.—Gardens often suffer with other parts of the farm from drouth, tho' there is not the same excuse for shallow tillage in the former. Depth of soil is invariably found to prevent, in a great degree, the effects of long continued dry weather. In a deep rich soil, the roots *go down*, and, in such a soil moisture constantly rises from below, as it can not and will not form a compact subsoil. Deep soils also take up moisture from the air, as a hard, shallow soil can not, because it lacks the necessary porosity. Remember, this in all your garden operations.

Old Sawdust for Young Orchards.—A writer in the *Farmer and Visitor*, finds old rotten sawdust an excellent application for young, or newly planted apple trees. He experimented with stable manure, leached ashes, and well-rotted barn-yard dung, and the trees treated with sawdust grew the best—the bark being smoother and the trees healthier. All did well, however. Part of the orchard was planted to corn, the rest to potatoes. The trees did best among the potatoes.

What Parts Produce Fruit.—Pruning cannot be performed judiciously, without a knowledge of the different parts on which, in different varieties, the fruit is grown. "Apple, Pear, Cherry and Plum trees, for the most part, produce their fruit on spurs from the old wood, but some varieties of the Apple and Pear, bear fruit in clusters from the ends of the branches. White and Red Currants are produced on spurs from the old wood, while the best Black Currants are found on the new wood; Peach trees and Grape vines produce their fruit on new wood; Raspberries on the canes of last year's growth," dying out after bearing.

Sowing Flower Seeds.—Many kinds of annuals have very small seeds, rather difficult of germination without much care in securing the requisite fineness of soil, proper depth of sowing, and even moisture. After they come up, they should be shaded from the hot sun, and watered if the weather is very hot and dry.—Do not plant before the season is pretty well advanced, as nothing is gained by it, at the best, and the seeds are liable to fail from cold and exposure.

The Verbena.—Get a few pots of Verbenas of different varieties, if you have them not, and turn them out in beds of good rich soil, where you wish to make a fine show of low-growing flowers. There are few more beautiful, or which bloom so long and abundantly as the Verbena.—H.

GOLDEN BARTONIA.

The series of Annuals which we have had the pleasure of presenting to our readers, have been very generally admired. We hope at some future time to continue them; but as the season for sowing is now ended, we have concluded to give no more at present. Several of our readers have sent to us for seeds. Mr. James Vick, Jr., the publisher of the *Horticulturist*, has the seeds, and advertised in the Rural, that he would send a choice collection to any one remitting a dollar. We cannot close the series more appropriately than by giving in this number a representation of the Golden Bartonia. (*Bartonia Aurea.*)—The Golden Bartonia is one of the finest of our modern annuals. Its petals are remarkable for their metallic gold-like lustre, hence the name. It was introduced into England in 1835, by the Botanist Douglass, who discovered it in California, that *golden* State of our Union, where the hills are pierced with *gold* veins, and the rivers roll down their *golden* sands, and the hill-sides and rich valleys are covered with the *Golden* Bartonia. Mr. Douglass "introduced many beautiful flowers as the result of his botanical tour in California, and the Golden Bartonia is one of the most beautiful of them all." This excellent Botanist was killed a few years after by falling into a pit, made to entrap wild cattle in the Sandwich Islands. He introduced into England more ornamental annuals than any other collector.

"It is only beneath the bright sunshine," Dr. Lindley observes, "that its splendid flowers unfold. In the early morning the plant is a shabby bush, with pale greenish-gray branches, and weedy leaves; but as the sun exercises his influence, the petals gradually unroll as if in acknowledgment of his power, till every branch is radiant with gold: and so metallic is the lustre of the inside of its petals, that one would really think they must be composed of something more solid and enduring than the delicate and perishable tissue of a flower."

The seed should be sown in a rich, well pulverized, and rather moist soil. The stems and branches are very brittle, and are quite frequently broken off by the wind. A situation, therefore, as much sheltered from wind as possible, should be selected.

TREES.

Few farmers appreciate the value of trees; few think how much is added to the comforts of life by good orchards, properly cared for, and shade trees tastefully arranged around the homestead. In this State (Vermont,) less attention is paid to the transplanting of trees and the cultivation of fruit, than in almost any other in the Union.

We see few young orchards of fruit trees—they are all old and fast going to decay. We see few lawns, yards or parks, ornamented as they *ought* to be with trees. Now, when we reflect that fruit—many kinds of which may be grown with little trouble in this region—is the most profitable crop that the farmer can raise, we cannot but be surprised that so little attention is paid to its cultivation.

When a farmer is asked why he does not plant fruit trees, almost invariably his reply is, that he will never reap the benefit of so doing. But this is not the case; the cash value of a farm on which there is a thrifty orchard of young trees, is much greater than that of a farm, equal to it in all respects, with the exception of the trees; and furthermore, nine farmers in ten, do not work for *themselves*, but for their *children*, and aside from the profitableness of fruit for home consumption, the sale of fruit from an orchard of one hundred trees, would bring in annually, a handsome income to the owner.

Shade trees, also, add materially to the value of a farm, aside from considerations of comfort. Maples by the wayside, and elms, locust, maples, and in fact, most kinds of forest trees, planted in the yard or on the lawn, render home delightful, and contribute greatly to render it worthy of the name. Let every land owner plant fruit and ornamental trees.

Castleton, Vt., 1851. H. H. S.

The St. Ghislain Pear.—In this locality the St. Ghislain is the best of all pears, surpassing even the Seckel or Bloodgood. It is one of the few foreign varieties of pears that perfectly acclimate themselves to our soil and climate. The only difficulty in regard to it, is its great fruitfulness, which renders it necessary to destroy at least one-half of the sets in even years. I have seen as many as twenty-five fine pears of this variety attached to a branch not six inches in length. The pears that succeed best in this locality, and which never fail, are the Bloodgood, St. Ghislain, Bartlett, Beurre Bose and Seckel. Can you, or any of your correspondents, inform me how to keep winter pears from becoming mellow and insipid before the proper time of ripening?—Notes Collator, *Watertown, Conn.*

BONES IN THE GARDEN.

We are, every season, discovering fresh evidence of the great value of bones as a fertilizer. We have to-day been removing some pie plant, seedling of the Victoria, that were set out with bones under them last spring. The roots had, in many instances, completely penetrated the bones, so that they were lifted with the roots. They help the formation of small fibrous roots, and make the growth of the plants very vigorous. In removing a grape vine last season, we noticed the same fact. We now consider bones, or their equivalent, as indispensable in the garden. We put from a half to a whole bushel in every hole in which we set a fruit tree. The season of tree planting is not yet over; and we would say to our friends, make your holes broad and deep, and use bones liberally, if you would have a quick growth and fine fruit.—*American Agriculturist.*

Cure for Rose Bugs.—Among the many remedies given, only one that we are aware of, has ever proved effectual, namely, destroying by first shaking them down on a spread sheet. In some localities where they are abundant on all kinds of vegetation, this may prove totally impracticable, but in ordinary cases they may be greatly thinned without much difficulty.—The best mode we have seen described for effecting their destruction, or that which promises the best success, is the following, given in a late number of the *Boston Cultivator:*—In the centre of the garden a few bunches of the damask rose are planted, which the rose bug prefers to everything else, and on which they mostly congregate. When the roses are in bloom, go to these bushes with a broad pan of hot water, and shake or jar the insects into it. By pursuing this practice, they soon disappear.

Bush your Tomatoes.—It is just as sensible to grow peas without bushing them as it is tomatoes. You may grow both in a slovenly sort of way, if you have plenty of room on the ground; but you can grow either twice as well upon something to support them, and tomatoes are decidedly better grown up in the air than near the ground, under the shade of a mass of vines. The best support for a tomato vine is a short bush set firmly in the ground. The branches have room to spread among the limbs and support the fruit. The plan is much better than tying to stakes and trimming, according to our experience. We have tried both ways.

Hybridizing Plants.—Dr. Hooker of London, says that out of more than ten thousand experiments tried, in the gardens of Kew to hybridize plants, not more than seven hundred succeeded. In those gardens, upon a space where not more than 200 plants would grow in a natural state, by perfect garden cultivation 20,000 have been grown.

Azaleas, it is stated, all come from Japan. They were sent to Europe from Batavia by the Dutch settlers there.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending May 9, 1854.

Simeon Coon, of Ithaca, for improvement in sewing machines.

E. L. Norfolk, of Salem, Mass., for improvement in machinery for drawing flax.

Clark Wheeler, of Little Valley, N. Y., for improvement in bee-hives.

Hernan Crosby, Jr., of Watertown, Conn., for improvement in sewing machines.

Christ'r Hodgkins, of Boston, assignor to Nehemiah Hunt, of same place, for improvement in sewing machines.

Otis Avery, of Homesdale, for improvement in sewing machines.

G. T. Enoch and Daniel Wissinger, of Springfield, Ohio, for improvement in seed planters.

Wm. J. Casselman, of Vernon, N. Y., for improved hub-borer.

Wm. Dammrel, of Brooklyn, N. Y., for improved extension bit guard key for door locks.

Hernan H. Dean, of Adrian, Mich., for improved fellue machine.

Jacob Edson, of Boston, for improved pump.

Chas. K. Farr, of Hinds county, Miss., for improvement in cultivators.

Albert Fink, of Baltimore, for improvement in bridges.

Chas. R. Fox, of Chicago, for improved journal-box for raw-mill carriage.

Nelson Gavitt, of Philadelphia, for improvement in machinery for cutting paper.

Platt C. Ingersoll, of Elmira, for improved arrangement of the pestle and mortar.

Wm. Loughridge, of Wererton, Md., for improved method of unloading canal boats and other vessels.

H. G. Marchant, of Annisquam, Mass., for improvement manure and sand border.

J. & G. W. Prescott, of Boston, for machine for reducing wool to slivers.

J. A. Roth and J. Lea, of Philadelphia county, for improvement in bleaching apparatus.

J. Rogers, of Poultney, Vt., for improved machine for marking out sash.

Wm. S. Reigert, of Spring Garden, Pa., for machine for weighing and printing butter.

A. M. Sprague, of Mobile, for adjustable flue bottom for steam boilers.

A. M. Sprague, of Mobile, for improvement in pistons for steam engines.

D. Talcot, of New York, for improvement in the construction of hatches.

Enoch Woolman, of Damascoville, Ohio, for improved arrangement of friction roller in inclined plane hinges.

B. & T. Winans, of Baltimore, for improved locomotive fire-box.

F. Davis, of Keene, N. H., assignor to J. M. Reed, of Swansey, N. H., for improvement in screw-jacks.

RE-ISSUE.

D. Lynahon, of Buffalo, for improvement in cutting books. Patented Oct. 18, 1853.

For the week ending May 16, 1854.

Wm. Barker, of Utica, N. Y., for improved clap-board joint.

C. Roberts, of Belleville, Ill., for improvement in harvester rakes.

H. Frisbie, of Olmsted, Ohio, for improved bath machine.

Wm. Stoddard, of Lowell, Mass., for improved rotary shingle machine.

C. A. Read, of Waterloo, N. Y., for improvement in self-heating smoothing irons.

W. L. Bass, of Cambridgeport, Mass., for improvement in tables for ships cabins.

S. A. Skinner, of Bromfield, Vt., for improvement in surgical splints.

I. M. Hopkins, of Pascoag, R. I., for improvement in knitting machines.

J. Putnam, of Salem, Mass., for improvement in moulding clay pipe couplings.

T. J. Sloan, of New York, for improvement in water indications of steam boilers.

C. G. Sargeant, of Lowell, Mass., for improvement in machinery for combing wool.

G. Rogers, of Enfield, Eng., for improvement in baths for coating metals with other metals.

Henry Burt, of Newark, N. J., assignor to the "Newark Patent Hosiery Co.," of same place, for improvement in knitting machines.

A. Greenleaf, of Kingston, Pa., for improved water wheel.

L. Lackey, of Sutton, Mass., for improvement in machines for pegging boots and shoes.

H. B. Hannion, of Bristolville, Ohio, for improvement in ox-yokes.

D. P. Baldwin, of San Francisco, Cal., for improvement in shower bath.

L. Dederick, of Albany, N. Y., for improved hay and cotton presses.

G. E. Higgins, of Syracuse, N. Y., for improved fastening for ear-rings.

F. Baker, of Pepperell, Mass., for improved lathe for irregular forms.

B. Hughes, of Rochester, N. Y., for improvement in trip-hammers.

C. M. Dabell, of New London, Ct., assignor to himself and A. P. Dabell, of same place, for improved catch for holding the bit in brace stocks.

W. Eaton, of Carbondale, Pa., for improvement in machines for cutting glaziers' points.

C. H. Dann, of West Lebanon, N. H., for improvement in potato diggers.

J. Holtz, of Berlin Township, O., for improvement in gun locks.

N. W. Gilley, of Nottingham Township, N. Y., for improved method of hanging gates, &c.

Wm. H. Mitchell, of Brooklyn, N. Y., for improvement in machinery for composing type.

J. Peck, of New Haven, Ct., for improvement in fire-arms.

L. Scott, of St. Louis, Mo., for improved portable grinding mill.

L. Stewart, of Washington, D. C., for improved saw.

H. H. Taylor, of Springfield, Mass., for improved machine for paging books.

Wm. H. Towers, of Philadelphia, Pa., for improvement in guitars.

Wm. H. Street, of New York, for improved mode of attaching blankets to cylinders for printing presses.

M. Spear, of Baltimore, for improvement in mitre-box.

I. W. Little, of Newbury, Mass., for improvement in ox yokes.

P. S. Howes, of Boston, for improvement in self-heating smoothing irons.

D. M. Smith, of Springfield, Vt., for improved bathe tub.

P. B. Tyler, of Springfield, Mass., for improved mode of nibbling saw teeth.

J. Edmondson, of Salford, England, and G. Haworth, of Marsden, Eng., executors of Thos. Edmondson, deceased, late of Salford, aforesaid, for improved case for holding railway and other tickets.

L. W. Leeds, and B. M. Smith, of Philadelphia, for improvement in pyrhaulic heaters.

E. Bruwo, of Waterbury, Ct., assignor to the "Scoville Manufacturing Co.," of same place, for improvements in machine for making hinges.

E. H. Graham, now or late of Biddeford, Me., assignor to himself and A. Wheeler, of Lowell, Mass., for improvement in magazine guns.

A NEW QUILTING FRAME.

The *Michigan Farmer* describes a new quilting frame, which economises space, and if it works as well as is claimed for it, it must be practically admired by the ladies. It is compared to a table frame two and a-half feet wide by nine and a half long. Two or three inch scantling placed eight-square, or round, is used for the side rails. On the ends of these is made a round tenon, one and a half inches in diameter, and one inch longer than the thickness of the end rails at the shoulder of the rail, on one end of each a small wray wheel, made of cast iron, or thick sheet iron, may be nailed to the end of the tenon. The wheel is about four inches in diameter. A small dog made of nail-rod, should be attached to the end of the frame, so as to play on the wray wheel. Along the side rails a strip or list of cloth is nailed, to which the quilt is stitched. When the quilt is put together, sew one side to the listing of one rail and roll it on so far that the other side of the quilt may be fastened to the other rail and the work is ready. As fast as quilted roll up the wray wheel and dog, holding all in its place. The frame is light, portable, and takes up but little space compared to the old fashioned, long-armed contrivances. T. E. W.

Domestic Economy.

PRACTICAL HINTS.—BY A FARMER'S WIFE.

To keep Butter solid, and sweet, in hot weather.—Have a stone jar, (or butter firkin, the first is the best,) half full of brine, that will float an egg. Sugar may be added, but is not indispensable. Into this, drop your rolls, or prints of butter, when thoroughly worked, and ready for use. Keep the jar closely covered, and you will probably not have a plate of oily butter on the table all summer,—unless you are in the habit of putting your butter upon the table the *first*, instead of the *last* thing, at meal times,—I have known such.

A Philadelphia Sponge Cake.—Take 10 eggs, 1 lb. sugar, ½ lb. flour, and lemon juice or extract, to flavor. Beat the whites to a stiff froth, warm and sift the flour; stir the yolks and sugar together, till light; and add the whites and flour, half at a time, alternately.—Stir the whole gently, till bubbles rise to the surface. Bake in a *moderate* oven.

Mock Terrapin.—*A supper dish.*—Half a calf's liver; season and fry brown. Mash it, not very fine; dust thickly with flour; a teaspoon mixed mustard; as much cayenne pepper as will lie on a half dime; two hard eggs, chopped fine; a lump of butter as large as an egg; a tea-cup of water. Let it boil together, a minute or two. Cold veal will do, if liver is not liked.

To drive Bugs from Vines.—A friend informs me that she conquered these miscreants, last year, by the free use of *hemlock oil*. A few drops on a bunch of cotton, for each hill; bury the cotton lightly, in the centre of the hill. Not a bug was to be found upon her vines. I believe the idea was an original one: the whole insect tribe seem to have an aversion to such perfumery.

Lice on Fowls.—A teaspoon of turpentine, to three or four of sweet oil—(the turpentine alone, would probably take the feathers off the poor birds,)—grease them freely with this, and let the Rural readers know, if the vermin do not "vamose." I have no doubt the free use of turpentine in hen-houses, would rid them and their inmate of these pests.

Sore Teats.—Molasses is the very best application, to heal the cracks in the teats of milch cows, or the bites of the sucking calf.—Wash the milker with cold water, before applying the molasses. Nothing I have ever tried cures so quickly. A *kicking* cow is frequently cured, by the same remedy, provided the milker is careful to keep *short finger nails.*

To make Camphor Cake.—Take of lard, two ounces; spermaceti, two ounces; white wax, one ounce; camphor, half an ounce; and melt the whole together with as little heat as possible, stirring the ingredients well that they may unite. When nearly cold, it may be cast into a paper mould; pour the mixture gently in. When cold it is fit for use. Camphor cake is excellent for chapped hands or a rough skin; it is best applied after washing.

To clean Head and Clothes Brushes.—Put a table-spoonful of pearlash into a pint of boiling water. Having fastened a bit of sponge to the end of a stick, dip it into the solution, and wash the brush with it; carefully going in among the bristles. Next pour over it some clean hot water, and let it lie a little while. Then drain it, wipe it with a cloth, and dry it before the fire.

Educational.

[Written for the Rural New-Yorker.]

IMPORTANCE OF COMMON SCHOOLS.

"Nothing but a common school, nothing but a common teacher, what hope can grow out of, these opportunities!" This remark is not unfrequently made by a certain class, who put far more value upon the *source*, than upon the actual knowledge communicated. The rich and glowing shadow of a College, or "High-school," has far more attraction than all the intrinsic value of every primary institution of learning.

Now, there is no particular power in any title which a learned faculty may bestow.—Colleges and schools can confer *titles*, but close and diligent application can alone give knowledge. Money may give station and influence, but intrinsic merit and worth can give *true* dignity to character.

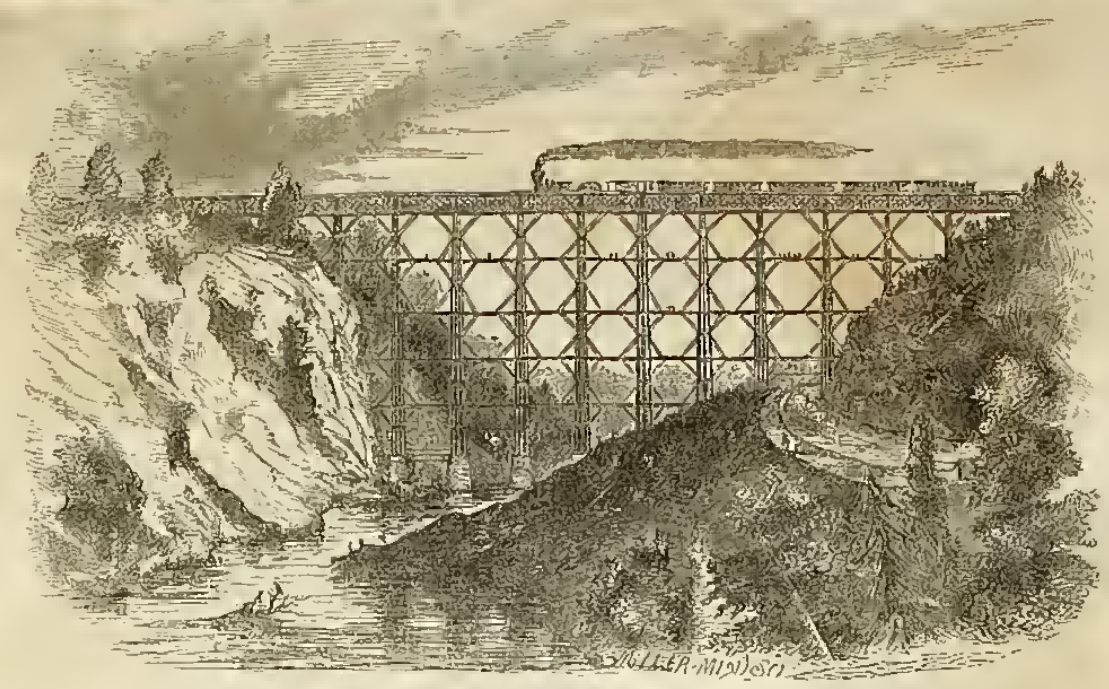
It is the peculiar property of education to make all things around look better—to rub off the dross and rust accumulated upon the surface of things, and exhibit its own power and beauty in the work it performs; but a fair exterior, a sounding title, is no infallible proof of the thorough interior work, which is of primary importance. All our institutions of learning are to be estimated according to their actual or relative benefit, and not from any pretensions or professions. It is the glory of our republicanism, that it establishes and patronizes so many institutions, designed to spread knowledge and morality over the land. And that this patronage is "*common*," that the poor as well as the rich may become learned and useful, is an interesting and peculiar feature in the policy of our government.

The Common School system is a great and magnanimous scheme to bring all classes of mind under the influence of education. It is not to the High-school and College alone that we owe those benignant influences, which fertilize and make glad the heritage of intellectual and moral development. These are powerful auxiliaries in the work of intellectual advancement, to be sure, but these are not the *first*; these are not, in my mind, of the greatest importance. The greatest men of our time, or many of them, have laid the foundation of their greatness in the common school. Daniel Webster, whose fame for intellectual greatness and power is world-wide, took great pains when a boy, to avail himself of the advantages of a common school. It is said he walked daily three miles to attend a common school. There the basis was laid, there, perhaps, the corner-stone of the proud superstructure of his greatness was placed. Who knows but the untiring and effective energy of his teacher, in connection with his own faithfulness, while in that common school, gave his mind the direction towards the proud eminence upon which he stood in after life? No doubt it was by a practical use of those things taught there, that he became great. Franklin Pierce, who now occupies the proudest eminence of worldly fame, spent many of his youthful days in a common school. And you will now find him the warm friend of that system of education.

The common school is to the development of the human mind, what the hand of a careful mother is in the parental management and training. It is the *nursery*, the place in which the die is cast, and the impression made in a multitude of minds. But the very thing that renders common schools unpopular with a certain class, is their chief excellence and glory, and that is because they *are common*. They are planted upon the general basis of the education of man—the development of mind.—As far as the peculiar privileges and advantages which they afford go, they are a distinguished *leveler* of the human race. The boy or girl whose fortune it may be to have been born of poor parents, is here made equal to the most affluent. This is the reason why many who make *money* the basis of character and knowledge, talk of common schools with such apparent indifference. The "poor boy" is obliged to endure the name of being educated in a "common school"—of having nothing but a "common school education." But there is not unfrequently an unmistakable illustration of the misapplication of terms in future life.

Go with them through life—follow them along amid its responsibilities and cares, and you will see the boy who has grown to manhood amid the false flatteries of affluence, relying mainly upon *money* for his fancied greatness and intellectual development, very poorly qualified to meet the stern realities of life.—But the lad of a "common school education," who has arisen by the power of close application, comes to the arduous duties of manhood with a ready and able hand. He knows where he is, and how he came there. He has marked his way step by step. He *knows* every inch of eminence he has gained. It has been no miracle—no phenomenon. He *toiled* and he has *conquered*. This is the sequel to his success—no matter where, no matter how—only "get wisdom." J. W. Barker.

Brockport, N. Y.



RAIL-ROAD BRIDGE AT PORTAGE.

In connection with the communication of our correspondent, S. A. E., describing the fine scenery at Portage, we republish an illustration of the magnificent Railroad Bridge which spans the Genesee just above the verge of the Upper Falls. This Bridge was constructed for the Buffalo & New York City Railroad, at the height of two hundred and thirty-four feet above the bed of the stream, and, adding to this height the full below of eighty feet, the spectator looks out of a car window, at the moment of transit, a distance sheer down of over three hundred! The fall is not in sight upon the plate, as the view is taken from a point above the bridge, and on the left bank, looking down the stream.

This gigantic structure is a triumph of engineering skill, and cost one hundred and forty thousand dollars. Two hundred and fifty acres of heavily timbered land were denuded to furnish the materials, and the frame-work is fastened together with no less than sixty tons of iron bolts.

All that our correspondent says of Portage Falls is true, and there are few localities either in or out of the State, that furnishes more sublime or interesting scenery.

The Traveler.

[Written for the Rural New-Yorker.]

PORTAGE FALLS.

No one who is fond of gazing at the more striking exhibitions of Nature's grandeur and beauty, who has ever visited the falls of our fair Genesee, at Portage, has failed to be deeply impressed with the view. These Falls, situated about fourteen miles from the village of Mt. Morris, and a short distance below Portageville, are three in number, distinguished as the Upper, Middle, and Lower Falls. The Upper Falls, by the constant action of the water, have, within a short time, assumed a circular form, which has given to them the name of the Horse-Shoe Falls. The bank upon the west side, stretching upward from the channel of the river to the height of more than two hundred feet, with its broad side of rugged rock, here and there decked with some wandering Evergreen or Wild Honey-Suckle, presents to the eye of an attentive observer, a grand and imposing aspect. The great body of the water is thrown over the eastern side of the precipice, which is about eighty feet in height, and, raging and foaming in the great reservoir beneath, the iris-forming spray is thrown to a great distance above and around, and the surface of the river far down, is covered with the white foam. What now makes a visit to these falls still more desirable, is the immense bridge, eight hundred feet in length, and nearly two hundred and fifty feet from the bed of the river, over which passes the Buffalo and N. Y. City Railroad. The eastern bank is far less rugged and steep; but the spray, continually falling upon it like gentle showers, gives it through all the summer months, the appearance of early spring time.

Passing down the river a short distance, we come to the Middle Falls, which in general appearance differs but little from the Upper. Here, spanning the whole width of the river with its broad arch, may be often seen a beautiful rainbow. Though inferior, perhaps, in several respects to the Upper Falls, there is, however, associated with them something which has rendered them quite as famous. Nearly under the Falls, and on the western side, is a wide-yawning chasm in the solid rock, said to extend inwards nearly sixty feet, which from time immemorial has received the strange name of "The Devil's Hole." I must acknowledge myself totally unprepared to account for the origin of this strange cognomen, unless it be that that aged gentleman himself took up his residence there in those times when hideous visages, horns, cloven-feet, and unaccountable long tails were to be seen in every cave and mountain-glen. Be this as it may, this is a fitting place (if we mortals are allowed to judge of such things) for the "Prince of Darkness" to conceive and consummate his fiendish machinations. Notwithstanding these horrid associations—*or for that very reason*—many a daring navigator has cheerfully endured a wet skin from the falling spray, in order to get a peep into this mysterious cavern. Below, the banks on both sides are rugged and steep, rising to the height of more than two hundred feet. Along the eastern bank, at that giddy height, passes the Genesee Valley Canal, at intervals passing through wooden trunks or ducts, which have the appearance of being fastened upon the edge of that awful precipice. Stand upon one of these, and look far down into the channel of the river below, its breadth dwindles to that of a mere brooklet—a man becomes a pigmy, and a boy somewhat *less* than a pigmy.

Still farther down the river are the Lower Falls, which, in the richness of their natural scenery, far surpass the others. These are not like the others, perpendicular, but the waters tumble down the sloping rocks for some distance, before they fall into the channel below. Where they begin to descend, the width of the river gradually decreases, until the whole body of waters, pressed into the compass of about twenty feet, through a channel which they have worn out for themselves in the solid rock, rushes with impetuous fury down the declivity, writhing and foaming in their mad career, as if endeavoring to wreak their vengeance on the stubborn rocks. Here, finding a horizontal bed, the waters, ere they are done boiling and foaming, are thrown full against a towering rock, and turning at right angles are finally precipitated into the river below.

Formerly the whole valley constituted the channel, and the waters had but one fall, and that a perpendicular one. No rocks, rugged and barren, are here to be seen on either side; but the banks, gradually sloping upwards, are covered with trees and shrubs, whose green foliage, in the glad summer time, presents every shade of color to delight the eye and inspire the brush of the painter. Niagara herself, with all her world-wide glory, cannot boast of such beauty, as is collected here. Niagara may *awe* her votaries by her *sublimity*, but these *please* with their great *beauty*. Art, with its degenerating influence, has never entered this retreat of Nature; and the old forest trees stand unshorn of their ancient glory, and make music to the passing breezes, as when the wild Savage first launched his bark canoe upon these waters. Untrammeled by modern innovation, *here* Nature utters a language all her own, and thus she talks with man.

On the north side (for the river has assumed a different course) is a broad rock, on which the stream once ran, and from its tabular appearance has been called "Table Rock." It is a venerable specimen of its kind. Its aged face has glistened with many a joyous pic-nic party, in which sweet-cakes, ice-cream, and jokes between merry "*lads*" and *smiling* "lasses," formed the chief feature. For many years, no Fourth of July has found this Table destitute of the choicest viands the country could afford; and for weeks after the birds dine on "dainties." There is probably no spot in our section of the country, where are concentrated so many objects of real interest and beauty—so many objects to attract the traveler, as at "Portage Falls" and the vicinity; and no one who has once paid them a visit, at that season when Nature having doffed her wintry garments, and assumed the bright green dress of summer, will fail to return often to this lovely spot. S. A. E.

Nunda, N. Y., 1851.

There is to me a daintiness about early flowers, that touches me like poetry. They blow out with such a single loveliness among the common herbs of pastures, and breathe their lives so unobtrusively, like pearls whose beamings are too gentle for the world.—*N. P. Willis.*

Constantinople has been besieged twenty-four times—eighteen times without success.—The place is one of the easiest to defend in the world, and Nicholas would find it hard work to get inside of its walls after he had reached their outside.

Useful Olio.

RULES TO AVOID RAILWAY ACCIDENTS.

In the last number of a very useful publication called The Museum of Science and Art, Dr. Lardner publishes the following:

PLAIN RULES FOR TRAVELERS

1. Never attempt to get into or out of a railway carriage while it is moving, no matter how slowly.

2. Never sit in an unusual place or posture.

3. It is an excellent general maxim in railway traveling, to remain in your place without going out at all until you arrive at your destination. When this cannot be done you go out as seldom as possible.

4. Never get out at the wrong side of a railway carriage.

5. Never pass from one side of the railway to the other, except when it is indispensably necessary to do so, and then not without the utmost precaution.

6. Express trains are attended with more danger than ordinary trains. Those who desire the greatest degree of security should use them only when great speed is indispensable.

7. Special trains, excursion trains and all other exceptional trains on railways are to be avoided, being more unsafe than the ordinary and regular trains.

8. If the train with which you travel meet with an accident by which it is stopped at a part of the line, or at a time, when such stoppage is not regular, it is more advisable to quit the carriage rather than to stay in it, but in quitting it remember rules 1, 4 and 5.

9. Beware of yielding to the sudden impulse to spring from the carriage to recover your hat which has blown off, or a parcel dropped.

10. When you start on a journey, select if you can, a carriage at, or near as possible to, the centre of the train.

11. Do not attempt to hand an article into a train in motion.

12. When you can choose your time, travel by day rather than by night; and if not urgently pressed, do not travel in foggy weather.

THE GREAT NAVIES OF THE WORLD.

We find in our exchanges a table showing the extent of the five first navies in the world. It purports to come from a pamphlet published by an intelligent American naval officer, and is doubtless correct, or nearly so. Here it is:

Vessels of War.	No. of Guns.
England.....667.....	13,339
France.....328.....	7,144
Russia.....170.....	5,850
Holland.....102.....	2,310
United States.....69.....	2,059

The same writer says:

"I find from the British navy List of 1852, that the government of Great Britain had 480 war vessels, besides those employed for harbor and coast defence, of which there are quite a large number. They do not, according to my computation, amount to quite so large a number as that stated above. But since the list was prepared an addition has been made, in view of the Russo-Turkish war, which would doubtless make the number as great as that stated above. Great Britain has now, according to a statement in an English paper, two hundred and two *Steam* vessels of war, or fifty-five thousand three hundred horse power.

According to our last Navy Register, the United States have two thousand one hundred and fifteen guns, instead of two thousand and twenty-nine, as stated above. It is clear that the United States, with a commerce and tonnage equal to that of Great Britain, has only about one-eighth of her naval force. This is too great a disparity. What would she do against England and France combined?"—*Journal of Commerce.*

Whiskey-drinking never conducted wealth into a man's pocket, happiness to his family, or respectability to his character—therefore whiskey is a non-conductor, and it is best to let it alone.

Sunday Reading.

LINES TO A STAR.

I see thee, bright and beauteous star,
In the regions of light and glory afar,
With glittering gems
Of fair diadems,
Which bedeck the sky on a starry night,
In the clearness and beauty of dazzling light.

I see thee, Heaven's celestial one,
Thou emblem of the rolling sun,
Thou sparkling ray
Of the solar way,
Which illumes and encircles the skies
That in holy grandeur o'er us rise.

I see thee, when Fancy will portray,
That thou art the realm of endless day,
That is free bright,
Of fairy light,
Inhabit thy clear and beautiful sphere,
Which to the Garden of Heaven draws near.

I see thee, and I fain would know,
If joys as pure as spotless snow,
Dwell ever there,
In thy starry air,
Where naught is heard but the chorus song
Which is chanted by the angelic throng.

I see thee, and methinks I hear
The thrilling tones of voices dear,
Of friends I love,
In worlds above,
In the lucid light of thy starry sky,
Where the happy live and the pure never die.

Alexander, N. Y. Mrs. P. E. S. H.

A MODEL PARSONAGE.

The following sketch of a country parsonage—such a one as our dominies need—is from the pen of T. L. Cuyler:

While at Boylston, I enjoyed very much a visit to one of the quiet and tasteful rural parsonages, such as nestle in many a shady courtyard throughout Yankee land. It was a place to study Edwards in—to write calm and thoughtful discourses, undisturbed by the buzzing of a fly—a place, as "Mercy" says, in the immortal allegory, "to think, and to break at heart, and to melt in one's spirit." This sweet haunt, sacred to theology and quietude, is but a type of a thousand others. In just such a one, only a few miles distant from Boylston, the patriarch Emmons spent his fifty years of patient toil, seldom moving during the four and twenty busy hours from that study-table, where his sharp eye pored over mighty folios, and his steady hand wrote out whole reams of "New Divinity." It was from such sequestered mansions that the Hopkinses and Smalleys and Bellamys ruled for nearly a century over a large portion of New England Israel. Books have been written under the shadow of those old elms, that will live when the ancient trees themselves shall have fallen piecemeal to the earth. The "Freedom of the Will" and the immortal "Treatise on the Affections" were born in one of these silent nooks, and their fame has gone out into all lands.

I wish that every church in our wide borders had just such a manse as this one which so charmed my fancy. Oh! how much better sermons the congregations would have if they gave their pastors such places to prepare them in! I observed that the good minister had his yard filled with well-laden fruit trees, where he might "sit down under the shadow with great delight, and find the fruit sweet to his taste." Across the graveled walk was reared an arbor, which reminded me of the one under which the pilgrim rested when he had clambered up the hill Difficulty—and it was overhung with a vine whose "tender grapes gave forth a goodly smell." Hard by the parsonage was the village church; and how *white* it was! How green was the tidy churchyard! How hospitable looked the long array of sheds for meeting-going horses! How nicely swept and garnished was the cool interior of that church! And what a place to worship the God of order and of love it was! Peace be within thee, sweet, lowly sanctuary; and may the well-guarded flock who are led through these green pastures, and who feed by these waters of quietness, gather once more about their shepherd beside the river that *floweth out of the throne of God and of the Lamb.*

THE HOUSE OF GOD.

The glory of a sacred edifice lies not in its vaulted roof, and lofty spire, and pealing organ, but in the glory that fills the house—the divine presence; not in its fabric of goodly stones, but in its living stones, polished by the hand of the Spirit; not in its painted windows, but in its Gospel light; not in its choir of singing men and of singing women, but in the music of well tuned hearts; not in its sacred priesthood, but in the great High Priest. If every stone were a diamond, and every beam a cedar, every window a crystal, and every door a pearl; if the roof were studded with sapphire, and the floor tesselated with all manner of precious stones; and yet if Christ and the Spirit be not there, the building has no glory. The house of God must have a glory beyond what Solomon's cunning workmen can give it, even the Lord God, who is "the glory thereof."—*Remains of Rev. William Jackson.*

I pity the unbeliever. He sees nothing above, around, or beneath him, that evinces the existence of a God; he denies—yea, while standing on the footstool of Omnipotence, and while gazing upon the dazzling throne of the Eternal, he shuts his intellect to the light of reason, and denies there is a God.—*Chalmers.*

I am a man of peace. God knows I love peace. But I hope I shall never be such a coward as to mistake oppression for peace.—*Kossuth.*

Those who obey divine precepts, shall have the comfort of divine promises.

MORNING MIST.

BY ELIZABETH J. EAMES.

HUSHING like an ideal glory—"Down the earth and sky,
Clear along the orient, the morning mist doth lie:
Quivering hue and delicate outline the scene,
Resting like a dawn of light on the landscape green;
Tints of purest Emerald change to pale Amethyst,
Through those trembling breaths of azure—subtle morning mist.

Flinging o'er the distant mountains, many streaks of light,
Rising all the taller hill-tops, in a shadowy white:
Over every stream, and valley, in the scented air,
In light cloud-shapes moving, changing, shimmering here and there!
Till lost often by the ardent warm lip a sunshine kiss'd,
Melts the delicate and dainty, subtle morning mist!

[For the Rural New-Yorker.]

RURAL RAMBLES AND REVERIES.

"In those fair seasons of the year when the air is calm and pleasant, it were an injury and sullenness against Nature, not to go forth and partake in her rejoicings in the heavens and the earth." Thus spoke Milton, who, though he sung in immortal strains the noblest of epics, yet did not disdain to tell in simpler verse, of

"Hedge-row elms and hillocks green,
Meadows trim with daisies pied,
Shallow brooks and rivers wide."

And it is with kindred scenes and fancies, tho' with no claim to kindred powers of describing them, that we shall have to do in these simple sketches.

That Spring, in all its fresh and verdant beauty, is here, we can discover anywhere, yet only in the country can be enjoyed all its fullness and fragrance. Our corn is planted, and our "Spring's" work done—so this Saturday afternoon we will go back a few years to the privileges of boyhood again, and have a holiday;—we will go out among the trees, beside the brooks, across the meadows, through the orchards and over the hills—anywhere that the beauty of Nature may lead us; keeping on the look-out for scenes and thoughts of pleasantness, and bringing back a bunch of wild flowers, fresh from the wood-side, for those who love us. Who of the RURAL family will accompany us on our ramble to-day?

Through the orchard, at first, where "showers of pearl"—the delicate apple blossoms—have just fallen upon the trees. We love this scene and season the more, that the only anniversary we are entitled to on our own account, ever shares in its fragrance. And the orchard of the homestead is all the dearer because it first began to blossom when we first began to live, and many of our joys seem twined, twin-like, with the trees beneath which they found and gladdened our boyhood. But the humming birds are here as of yore. See! one alights on a slender twig, and arranges his delicate plumage. The feathers of his throat and breast are of the brightest crimson, a deep velvet-like green are those on his back—or, viewed in some lights, a rich purple; underneath, how purely white. Ah! he is off—far away—ere we can tell how many colors he plumes himself upon displaying.

Aye! we love to watch the birds—the blessed birds. Their songs are melodies of love and happiness, their flight a movement of careless and easy gracefulness, their lives a year without a winter, full of cheerful sunshine, and redolent with the perfumed blossoms of joy. We love them, and shall start them again and again in this rural ramble, and their notes will often be the key-tone of our reveries. For now

"Their are notes of joy from the Hee-bird and wren,
And a gossip of swallows through all the sky,"

and one of the first is building a nest not far away, while the second has his already completed, and two little treasures of eggs therein; and the last—the gossiping swallows—are holding a mass meeting, or something of the sort, on the sunny-side of the barn roof, beneath whose eaves and rafters so many of them can fly to their birth-nests, though they may also tell of long and perilous journeys in regions to us unknown.

But let us go on to the forest. We can follow the brook there, and listen as we go to its tinkling ripple o'er the white pebbles, watch the swift and bright, but little fishes that dart through its crystal waters, and rest, if we wish, beneath the pendant branches of the graceful golden willows, upon its grassy banks. Soon it leads us, like a friend who takes one into the sanctuary which he loves, to the great old wood—one of the undisturbed retreats of Nature. On either hand are the giant trunks that have braved the storms of a hundred years, and over our heads are the gnarled and mossy branches, which have a hundred times renewed their verdancy.

In the thick forest, lifting the dead leaves of seasons gone, the sweet small flowers spring up beneath the step of May, most beautiful in their unaffected simplicity. We look with reverent awe upon the hoary patriarchs of the forest, but the lowly flowers inspire us only with tender and pleasing emotions; theirs is a language for the heart.

"By fragrance do they whisper,
As we speak by words;
As the brook by murmur;
As by song the birds;
Softly in their gentleness do the violets speak,
Of love and truefulness, and their words are low and meek."

The profusion with which they are scattered over the earth, so varied in beauty and perfume, for our delight, affords a demonstration of the goodness of that Power which ruled at creation, and still continues mindful of the happiness of all that dwell upon the earth.—How often, when we turn from the proudest works of man unsatisfied, may we find in the simple beauty of the flowers which adorn the forest, that which shall bless and soothe our aching hearts.

But we are moralizing, instead of rambling. Here are butterflies to tempt us in the same path, but we will only describe them,—one as white, the other yellow,—with gold-powdered wings that glitter in the sunbeams, when they chance to struggle through a long-hole in our roof of leaves. They pass on—fluttering from flower to flower—toying with the first fresh blossoms of spring-time. And this thrush—no great beauty in form or feather—bursts into an ecstacy of song, as if he would pour out his joyful notes so musically as to convince all who hear, of his happiness. No one can doubt it, and we feel our heart made lighter, as it swells out upon the air in all its melodious richness—in all its voluble windings and alternations.

We may not ramble further, and now turn homeward. It is becoming fashionable to domesticate the robin, and it is not to be wondered at, when his beauty and powers of song are considered; but here it would hardly be necessary to cage them for this purpose. They are almost tame around our dwelling, and at all hours of the day you may see them attending their home-keeping duties, or hear their clear musical notes swell out from some fruit or shade tree, as sweetly, and far more suggestive of happy thoughts to the listener, than any "gay birds in cages pining," though they come from afar, and wear a brighter plumage.

This smiling day of spring-time, is drawing to an end. The sun sinks softly in the crimson west, giving to the clouds which cluster there, tints vieing with the "seven-fold glory" of rainbow. Nearest the sun all is light—undimmed light—seeming as tho' the splendors of the world unseen, were there unveiled to mortal gaze. Small crimson clouds float in the sea of brightness like burning censors, while above darker folds, as of flame and smoke from some vast conflagration, lend grandeur to the scene.—And, here and there, where the curtaining clouds are rent, the eye may rest on the sky, its beautiful azure heightened by the contrast, and awakening thoughts of purity, the peacefulness, the holy rapture of that Heaven where innocence, quiet, and joy, forever make their home.

—Have we seen aught worth notice in our rural ramble? May we not go back to our labors refreshed and strengthened by the ministry of thoughts and scenes like these?

Royalton, Niagara Co., N. Y. J. H. B.

TAKEN AT HIS WORD.

CROMWELL was thinking of marrying his daughter to a wealthy gentleman of Gloucestershire, when he was led to believe, by domestic gossip, that one of his own chaplains, Mr. Jeremy White, a young man of pleasing manners, and "a top wit of his court," was secretly paying his addresses to Lady Frances, who was far from discouraging his attentions. Entering his daughter's room suddenly, one day, the protector caught White on his knees kissing the lady's hand. "What is the meaning of this?" he demanded. "May it please your highness," replied White with great presence of mind, pointing to one of the lady's maids who happened to be in the room, "I have a long time courted that young gentlewoman, and cannot prevail; I was therefore humbly praying her ladyship to intercede for me."—"How now, hussy!" said Cromwell, to the young woman, "why do you refuse the honor Mr. White would do you? He is my friend, and I expect you should treat him as such."—"If Mr. White intends me that honor," answered the woman, with a low courtesy, "I shall not be against him." "Goodwin! this business shall be done presently, before I go out of the room." Goodwin, the chaplain, arrived; White had gone too far to recede, and was married on the spot to the young woman.
—*Guizot's History of Oliver Cromwell.*

EXPERIENCE—Great is the difference between the experimental reality of human life and that beauteous picture of earthly bliss which the young and buoyant heart is wont to paint. Ripened experience and matured judgment go far to modify the hasty and crude decisions of the untutored and untried imagination. In the morning of life the future appears bright, and the prospect altogether lovely; but more mature age, without extinguishing this joyous feeling, chastens and subdues it, enables it to find a more substantial basis, teaches it to cling more to that which is really and intrinsically good, and to be guided more by the sound deductions of wisdom than by external fascinations, which fade away whilst we admire them, and perish in using them.

FORGET not that life is a flower, which is no sooner fully blown than it begins to wither.

MEN of profound thoughts and earnest minds are at a great disadvantage with the public.

ROSE RAY,—A VERNAL INVOCATION.

BY J. C. MILLER.

SPRING flowers in the forest are blooming, ROSE RAY,
The grasses are all vocal with song;
The skies like your bosom, are glowing, ROSE RAY,
Then why should we tarry so long?
We'll go through the meadows and over the lea,
To gather sweet posies, ROSE RAY:
The breezes will blow till your dimpled cheeks glow,
And emulate roses, ROSE RAY.

The scenes which we loved in our childhood, ROSE RAY,
Have lost not a charm that they wore;
The flowers which then bloomed in the wildwood, ROSE RAY,
Still bloom as they bloomed there of yore.
Then come, roam with me, over meadow and lea,
To gather sweet posies, ROSE RAY:
The breezes will blow till your dimpled cheeks glow,
And emulate roses, ROSE RAY.

Russell, Ohio, 1854.

Trans-Atlantic Epistles,
TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE FOURTH.

TIBLEMONT, BELGIUM, Feb., 1854.

DEAR COUSIN KATEY:—In one of my previous letters I told you that there were two American girls here, in a boarding-school kept by the "Sisters of Notre Dame." Our common nationality make us excellent friends at once, and may we call upon them quite frequently, partly for the pleasure of chatting a little in our own mother tongue, instead of laboring with giant efforts to clothe the little nothings of conversation in a French garb, and partly from the benevolent desire of alleviating as far as lies in our power, the imprisonment of the unfortunate damsels. *Imprisonment* I say, and in legal phrase I speak advisedly, for no other word expresses the close confinement and the constant espionage exercised in these establishments, which resemble a veritable nunnery more than an American boarding-school. If the Misses in our own land, whose complaints are so loud and long, with regard to the restrictions imposed upon them, could be transferred for a time to a French *Pensionnat*, I fancy they would return to their own schools with spirits somewhat subdued by the discipline, and better prepared to appreciate the comparative liberty they now enjoy. In these Continental boarding-schools young ladies are never for a moment alone. They sleep in a common dormitory under the surveillance of teachers, and often with a guard whose duty it is to watch while they slumber. Their hours of study are all spent in the school-room, under the eye of the teachers, and there is also a large room assigned to their recreations, where they are equally subject to supervision. When the weather is fine, they are allowed to pursue their sports in the garden, attached to the institution, which is surrounded by walls so high as to screen them effectually from any intruding eye. These walls they never pass, except as they are occasionally treated, under careful guardianship, to a walk of two or three miles into the country. No letter or package of any kind can enter or leave the building without being first submitted to the inspection of "*Madame Superieure.*" Even the correspondence between children and parents is not free from this scrutiny.

It is astonishing to see the entire transfer of parental responsibility to teachers in this country. The schools seem to be organized and designed for the express purpose of relieving parents from all care of the physical and moral, as well as intellectual education of their children, and a Belgian mother is perfectly satisfied that she has done her duty to the young immortal committed to her charge, if she has placed her in a *pension* at eight or ten years of age. After that she takes no further care of her, and, in fact, almost appears to lose the consciousness that she still sustains the maternal relation. For example, one of the pupils in the school here, has received but two visits from her mother during a year, and both of these were occasioned by notes from the Superior, stating that her conduct had been remarkably good. How far, think you, does this tender mother live from the establishment that contains her darling child? Only a few doors, her house and the school-building being upon the same street!

The vacations are about the same in length, and arranged in the same manner as with us. These are usually spent at home, but when a child is sent to school at any considerable distance, several years will often elapse without his paying any visit to his parents, while the correspondence is limited to a formal statement of health and progress in studies, despatched once in three months or thereabouts. A single illustration, taken from what we have incidentally learned of the management of the school here, will give you an idea of the systematic manner in which children are trained to have no will or judgment of their own, but to seek the direction of their superiors in all matters, however trivial. If a good aunt or indulgent grand-mamma has brought her darling a paper of *bon bons*, as soon as the kind relative has taken her departure, the little girl or the young lady, as the case may be, for no distinction is made between these classes in the discipline of the school, must at once carry the gift to her teacher, who will tell her what proportion she may retain for herself, and how much she must distribute to her playmates.

Religious instruction is made a prominent part of the regular course of study, particularly in the establishments conducted by the different religious orders. In fact, one great object for which these schools are instituted, is to "prepare children for their first communion," as it is termed, a process which consists in teaching them the catechism of the Catholic church, and which is usually completed by the time they are ten or twelve years of age. The day of their first communion is a great *fete*; the young girls are dressed as well as the means of their parents will allow, all with white veils and wreaths of flowers upon their heads, as if for the marriage ceremony. The veil which is purchased on this occasion often serves a few years later for the bridal toilette. Friends from far and near come to celebrate the happy event. The children are loaded with presents and *bon bons*, and no effort is spared to make that day what they are taught to believe it is, the happiest of their lives. A young lady here, with whom I have become quite intimate, and whose youthful independence of character, even the rigid discipline of a *Pensionnat* could not entirely curb, has given me an amusing account of her reasoning on the occasion of her first communion. During the *fete* which followed the ceremony, the *cure*, with whom she was quite a favorite, took her on his knee to chat a little with her. "Dost thou know, my child," said he, "that this is the happiest day of thy life?" (In French, as in several other European languages, *thou* is employed instead of *you*, in familiar and endearing conversation. You remember, KATEY, how much stress FREDERIKA BREMER lays upon this mode of address in her novels.) "No," frankly replied the spoiled child, "in some years I think I shall be much happier." "But to-day thou hast for the first time *received thy Creator*;" (a favorite expression of the Catholics, when referring to the Eucharist, inasmuch as it implies their cherished doctrine, the *real presence.*) "Well, I might have done that four or five years ago," said she, "for I knew then that there is a God, and I do not know any more now, and," she innocently added, "I do not believe the good God cares about our fine clothes." Yet the very child who made this frank confession of ignorance, had been selected from all the others, on account of her perfect knowledge of the catechism, to answer the questions in the examination which precedes the communion.

Catholic children are not taught to exercise their reason upon matters of religion. On the contrary, they are made to believe that any act even to investigate the whys and wherefores of a particular doctrine or practice, is a sin—If the church commands its reception, that is an all-sufficient reason which none may gainsay or resist. They learn their prayers, their creed, and their catechism by rote, like so many parrots, and if they wish to know whether a given thing is right or wrong, they—*go and ask their priest!* Not long since, the young ladies of the school here, went in a body to their spiritual guide to inquire if there was any harm in drawing embroidery patterns on the Sabbath. He replied in the negative; so they doubtless applied themselves to the work without the least compunction of conscience, and will probably go on through the remainder of their lives, doing this or something similar on Sunday. There is some difference, is there not, KATEY, between this way of observing the Sabbath, and the manner in which we were taught to reverence it? How we should have stared with astonishment if in those days of yore, when through the long, still, summer afternoons we watched the sun that we thought never *would go down*, our good minister had entered with the announcement that embroidery patterns were a proper theme for Sunday meditation!

Religious instruction is not limited in the schools kept by *Religieuses*, to the preparation for communion, but more or less time is devoted to it daily, throughout the whole course of study. Extraordinary occasions, such as the visit of some holy father to his spiritual sisters, or a remarkable fete day, are usually made the opportunity of conveying some lesson of piety, or of relating some Popish legend, often as wild and incredible as any fairy tale. On St. ANTOINE'S day, which occurred not long since, the pupils of the *Pensionnat* here, were edified with the following narrative. This saint, who was a missionary in foreign parts, was one day preaching near the borders of the sea, to a congregation of pagans. His hearers being quite irreverent and inattentive, the good man finally exclaimed in a reproachful tone, "even the dumb fishes of the sea are more ready to hear the word of their Maker than you." No sooner had he pronounced these words than an immense multitude of fishes at once issued from the sea, and advanced towards him in regular order, the largest in front, the smallest behind. They listened with attention while he finished his discourse, and, when he had pronounced the amen, retired with a reverent obeisance to their watery home. This is a specimen of the legends which Catholic children are taught to receive as absolute truth. Do you wonder that they grow up slaves to superstitious fears, and with consciences which their priests can sway at will? A favorite mode of overawing a fractious child, in the school I have already cited so many times, is to exclaim—"How do you know but you will have a hundred years in Purgatory for the sin which you are now committing?" This mysterious insinuation could hardly be relied upon as a means of discipline in a Protestant school, but the Catholic child who dares resist it, must be bold indeed.

The course of study pursued by girls in this country is quite limited, in comparison with that adopted in America. Geography, History, the rudiments of the natural sciences, and a thorough grammatical and practical knowledge of the French language, are the branches usually attended to. The German language is sometimes learned, and English is becoming quite popular, but young ladies here seldom, if ever, dabble in the higher mathematics, the ancient languages, or the intellectual sciences. What they do learn, however, is well learned, and much attention is paid to forming the manners, and to acquiring the strictly feminine accomplishment of needle-work. *Mending* is made a distinct branch of needle-work, and a young lady is not considered well educated unless she can fill up an unlucky vacuum in a stocking, by following the stitch so exactly as to make it next to impossible to distinguish the piece thus inserted from the original fabric, and darn table linen in such a manner that her stitches shall imitate precisely the pattern of the damask. Methinks some of our American girls would find such accomplishments as useful, to say the least, as the poor smattering of Geometry or of Latin which they so laboriously acquire during their school-days, only to be thrown aside as useless when they assume the cares and duties of married life. But I am making my letter most unconscionably long, and must close abruptly, before I weary your patience. Truly yours, MINNIE.

A HAPPY HOME.

IN a happy home there will be no fault-finding, over-bearing spirit—there will be no peevishness nor fretfulness. Unkindness will not dwell in the heart or be found on the tongue. O, the tears, the sighs, the wasting of life, and health, and strength, and time—of all that is most to be desired in a happy home, occasioned merely by unkind words! The celebrated Mr. Wesley remarks to this effect, namely, that fretting and scolding seem like tearing the flesh from the bones, and that we have no more right to be guilty of this sin, than we have to curse, and swear, and steal.

In a perfect happy home all selfishness will be removed. Even as "Christ pleased not himself," so the members of a happy home will not seek first to please themselves, but will seek to please each other.

Cheerfulness is another ingredient in a happy home. How much does a sweet smile, emanating from a heart fraught with love and kindness, contribute to render a home happy! How attracting, how soothing is that sweet cheerfulness that is borne on the countenance of a wife and mother! How do the parent and child, the brother and sister, the mistress and the servant, dwell with delight on those cheerful looks, those confiding smiles that beam from the eye, and burst from the inmost soul of those who are near and dear! How it hastens the return of the father, lightens the cares of the mother, renders it more easy for youth to resist temptation! and, drawn by the cords of affection, how it induces them with loving hearts, to return to the parental roof!

O that parents would lay this subject to heart—that by untiring effort they would so far render home more happy, that their children and domestics shall not seek for happiness in forbidden paths!

CHILDREN.—A popular writer speaks of little children as the poetry of the world; the fresh flowers of our hearths and homes, little conjurers, with "natural magic," evoking by their spells what delights, and enriches all ranks, and equalizes the different classes of society. Often as they bring with them anxieties and cares, and fire to occasion sorrow and grief, we should get on very badly without them. Only think if there was never anything anywhere to be seen but great grown-up men and women! How we should long for the sight of a little child!

THE setting of a great hope is like the setting of the sun. The brightness of our life is gone. Shadows of evening fall around us, and the world seems but a dull reflection—itself a broader shade. We look forward into the coming lonely night. The soul withdraws into itself. The stars arise, and the night is holy.—*Thackeray.*

CORRECTION does much, but encouragement does more. Encouragement after censure, is as the sun after a shower.

LITTLE things should not be despised. Many threads will bind an elephant. Many drops make a river.

MOORE'S RURAL NEW-YORKER

ROCHESTER, MAY 27, 1854.

SPECIAL NOTICES.

☞ *A new quarter commenced April 8,—a good time for new single and club subscriptions to begin; and the renewal of expiring subscriptions is now in order.*

☞ *Additions to Clubs are still in order. If back numbers are not wanted, we will send from 1st March or April to end of year for $1—and count on premium.*

☞ *During the season of navigation we can send the Rural to Canada West free of American postage, and hence will furnish clubs for six months from date at lowest rates.*

☞ *Back numbers of the present volume furnished if desired, or subscriptions may commence at any time.*

To Correspondents.

Though negligent in acknowledging the favors of Correspondents, we assure those who have contributed to the Rural for years—and many more recently initiated—that their contributions are not the less acceptable. We are under particular obligations to those who have written for the Practical departments, and solicit facts, suggestions, results of experiments, &c., from all disposed to "teach one-another." Our Agricultural, Horticultural, Scientific and Educational, friends will please consider themselves invited, especially and individually to aid us in endeavoring to render the Rural worthy the wide circulation and extensive support it has attained.

Those who furnish articles for the Literary and Miscellaneous departments—and especially such as write thoughtfully and carefully, and of course intelligibly — must exercise patience in regard to their productions. The articles of our Assistants and regular Contributors are first in order, and we are often obliged to defer for weeks or months, the favors of occasional correspondents. Many articles of merit, we are obliged to omit altogether, on account of their length, lack of appropriateness, or the labor of preparing them for publication. Indeed we receive such a quantity and variety of matter that it would be impossible to publish, in our limited space, all that would otherwise prove acceptable—to say nothing of the numerous unintelligible effusions, in prose and verse, *and neither*, which it is most difficult to decipher, and would be uncharitable to give publicity.

Articles are not unfrequently received, accompanied with requests to publish as a *favor* to the writer, *because* he is a subscriber, &c., — while some demand this as a *right*. Those interested are assured that we recognise no such obligation. Should we accede to similar requests and demands, the Rural would probably soon abound in foolish, personal, axe-grinding articles, interesting to a *few*, only, of its tens of thousands of readers. But while we ignore the demand of a subscriber who wishes us to oblige him (though we thereby *dis*-oblige twenty thousand who possess equal claims upon our pages,) there are many cases in which it would afford us pleasure to comply could we do so consistently. Those who send us obituary notices, poetry on the death of friends, &c., and other matters of limited local or personal interest, are reminded that their county papers are the most appropriate mediums for their publication.

Anonymous articles receive little attention, and are often inserted — in the stove — unread. If you wish to obtain a hearing through the Rural, give *us* real name, though it may be withheld from the public. We cannot undertake to return manuscript or rejected articles, though we generally do so if a request accompanies the same.

Passage of the Nebraska Bill.

A telegraph despatch from Washington, May 23d, announces that the Nebraska bill finally passed the House of Representatives on Monday night at 11½ o'clock, by a vote of 113 to 100, amid a scene of great excitement and confusion.

Mr. Richardson, the leader of the Nebraska men in the House, immediately moved a reconsideration, and then moved to lay that motion on the table, which was forthwith done. This movement on the part of Mr. Richardson, was for the purpose of making the action of the House final, and thus giving an effectual clincher to the bill.

The favorable feature in the bill (for there is *one* favorable feature) is that the Clayton amendment in the Senate has been stricken out. This amendment precluded foreigners settling in the territory from voting, and thus making Nebraska an exception to all the other territorial governments. As it now stands, residents of foreign birth, will have a voice in the question of legalizing slavery; and when it is recollected that the entire German element of foreign emigration is deadly hostile to the institution, and that they are pouring into the West in numbers unprecedented, it is quite probable that the South will gain nothing by the venture. On the morning the telegraph announced in Rochester the passage of the bill, a train of twenty cars, all densely filled with emigrants, passed through our city, drawn by two locomotives, on their way to the West. Encouragement should be held out to this tide of emigrants to push on for new homes to the Westward and Southward of the Missouri, and then "Squatter Sovereignty" will vindicate itself in a different way from what many of the friends of slavery extension probably anticipate.

☞ The village of St. Hyacinthe, Lower Canada, has been wholly destroyed by fire.

Congressional.

May 15.—Senate.—A discussion took place to-day on a resolution concerning religious toleration, introduced by Gen. Cass. Reference was made to an alleged declaration published in the *Shepherd of the Valley*, a Catholic paper of St. Louis, in which it was stated that if the Catholics gained the ascendancy in the United States, religious toleration would be at an end. Gen. Cass took a prominent part in the debate, and denounced the sentiment.

On Tuesday, Mr. Mallory offered a resolution declaring that the recent acts of the Cuban authorities clearly show a design to throw Cuba into the hands of the African population, an event detrimental to the United States, &c.

The Vetoed Insane Land bill was then taken up, and Mr. Butler spoke in support of the veto.

The bill giving the Port Huron and Erie Railroad Company the right of way through the Military Reservation, was, on motion, taken up, read a third time, and passed on Wednesday.

On Thursday, the resolutions previously introduced by Senator Mallory, with reference to movements now going on in Cuba, were on motion taken up. They were then modified, making them simply resolutions of inquiry, and adopted. The President's veto of the Insane Land bill was again taken up.

On Friday, Mr. Cooper laid on the table a substitute for the bill suspending duties on Railroad iron.

A resolution offered by Mr. Slidell was adopted, directing the Committee on Commerce to inquire into the propriety of making suitable acknowledgments to the Captain and crew of the steamer Washington, for rescuing the passengers from the ship Winchester, after which the Senate adjourned to Monday.

House.—The intense excitement of the previous week bid fair to be renewed on Monday, but Mr. Richardson withdrew his motion for the previous question to close the debate on the Nebraska bill, and moved as a substitute that the debate be closed on Saturday; and on this motion he demanded the previous question.—The motion was carried, and the debate continued through the week. At the close of the session on Saturday several amendments were moved and rejected, and the Committee, without coming to a vote on the main question, adjourned over until Monday.

Matt. F. Ward.

This notorious individual publishes a card in the *New Orleans Delta*, addressed to the editors of the United States, asking a suspension of opinion upon the results of the late trial until after the notes of Mr. A. D. Richardson, a short hand reporter, shall have been published by the Appletons.

Mr. Richardson was employed by the Wards to report the proceedings, and so far as the report goes, it is without doubt correct, as it is authenticated by the Clerk of the Court; but it must be observed that the work is intended for an *ex parte* statement, since the whole of the speeches for the defence, viz., those of Marshall, Helm, Wolfe and Crittenden are given, and only *one for the prosecution*, Mr. Alden's.—The argument of Mr. Carpenter, who was the leading Counsel for the State, is wholly suppressed, as are also those of Messrs. Harris and Gibson. For the publication of such a report, does Matt. Ward ask for a suspension of public opinion, but the press with almost entire unanimity utter an indignant refusal.

Steamboat Casualty.—On Thursday of last week, the steamer Pike, on her passage from St. Louis to Louisville, struck a snag and immediately sunk to the hurricane deck. There were about 180 passengers on board, and most of whom were asleep in their berths at the time of the accident. The loss of life is variously estimated, some making it fifteen, while others estimate it as high as thirty or forty. Most of the cabin passengers escaped, as their berths are above deck, while the second class passengers were many of them lost. The officers of the boat are represented to have acted with great coolness and bravery, the engineer standing at his post until the water was up to his neck.

Coal Mine Explosion.—A coal mine near Richmond, Va., 625 feet deep, exploded May 14th, involving a sad loss of human life. There were employed in the mine some twenty miners, men and boys, but one of whom escaped alive, and he so terribly burned and bruised that he cannot survive. The scene is represented as most lamentable, and the distress of the wives and children, so suddenly bereaved of husbands and parents, was sorrowful indeed. This mine is a very dangerous one, and has exploded several times before, the last previous occurring in 1851.

Good News.—Advices have been received at Washington, that 10,000 citizens of Iowa and other States, will start immediately for Nebraska on the passage of the bill.

This must be very gratifying intelligence to slavery propagandists, and promises to put a curb bit in the black horse's mouth even before he gets fairly started on the course. Slaveholders, under this aspect of affairs, would present a sorry spectacle, being out-voted by free men, and compelled to run their chattels out of the territory to save them from emancipation.

☞ There have arrived at Alexandria, Va., during the present season, upwards of seven thousand tons of guano, and this supply is unequal to the demand. It sells for about $50 a ton.

Letter From a Farmer-Clergyman.

Though not more complimentary than scores of letters received of late from men of various occupations and professions, we publish the following because it alludes to features of the Rural which we have endeavored to make prominent from its commencement. The source of the commendation also gives it sincerity and weight in our estimation. The son of a Farmer-Clergyman, we naturally possess a high appreciation of the merits of a class who, by both precept and example, are prominent and influential advocates and exponents of "Progress and Improvement"—Moral, Mental and Physical. And the fact that this enterprise has received the approval and cordial support of hundreds of Clergymen throughout the land, proves that our efforts to furnish a good and pure, as well as eminently useful Journal, have not been unsuccessful. But to the letter:

Candia, N. H., 12th April, 1854.

Mr. Moore—*My Dear Sir:* Your papers reached my home a few evenings since; have read several, but have hardly had time to write you, till now.

For some number of years I have been like a man going into the forest for a shade tree to plant in front of his door; this he likes a little; that is a mere pole, without branches; there he sees one that will *almost* do—but is not quite the thing. So wandering about among the trees till weary, he takes one, not because it *suits* him, but because he *can't do better*.

My ideality and reason have formed a *beau-ideal* paper; but never till the Rural New-Yorker reached me, was it reduced to a fixed reality. Sir, I am no flatterer,—no; it is not flattery to say, that I regard the Rural, judging from what I have seen, as the most perfect paper published in this country, of which I have any knowledge. In few words let me tell you *why* I like it:—1. Its form is comely and beautiful—good white paper—type excellent—the heading expresses *meaning*, and is also showy. 2. The articles are all properly short, well-written, and to the point—and that's all that's ever wanted in newspaper articles. If there is one thing more than another that *sinks* a paper, in the mind of a thinking individual, it is long editorials, so dull and prosy that one almost is inclined to think the editor, when writing them, had just made his escape from the clutches of Bacchus, and fallen into the arms of Somnus. God grant that you may set your brother editors an example worthy of imitation. 3. Its great variety. I won't have it that "variety is the spice of life"—no, it is the *substance* of life. Who will say it is not, after reading the Rural? 4. Its healthy moral tone. Let those papers die, *and be buried*, that dare dip their polluted pens in the slop-bowl of social and political vice. In witness the chicanery, lying, vulgarity, and deception, of political papers at the present day, one is almost inclined to pray as David did, that they (the papers) "might go down quick into *sheol*."

As a clergyman, I admire your paper. It gives me thoughts, pure and satisfying. With its aid, I shall be better prepared to arrange my sermons, and fit them to do good. The world is teeming with brain-cracked theology. Here staggers the "Conflict of Ages," and there, all blazing, shoots forth the latest exposition of some dark, mysterious saying of Holy Writ. Now, who is not tired of these vagaries? Who does not wish to turn from these elaborated whims of the schools, to simple, lovely truth? And where, except in the Divine Word, shall we find truth written more legibly, than in the beautiful yet not gaudy chaplets of Nature?

Your prospectus I shall post up in our Post-office—hope it will do good in obtaining you subscribers in this place. Within this letter you find $1 for six months. Shall probably send you the other dollar before the year closes, should I live. Yours, very truly,

Palmer Chesley.

The Missing Steamer.—At the moment of the sailing of the Franklin from Liverpool, a telegraph dispatch was received from Cork, stating that the missing steamer, "City of Glasgow," had been heard from. She was spoken April 21, in lat. 45° 30' with a barque alongside, steering towards the Azores, her masts and other portions of rigging taken for firewood.

The steamer was described as having yellow paddle boxes, which do not correspond with those of the missing steamer; but the report serves to revive the almost extinct hopes of the vessel's safety.

Presbyterian General Assemblies.—The Presbyterian General Assemblies of the United States have both been in session during the past week; the Old School meeting in Buffalo, and the New School in Philadelphia. Many distinguished Divines of the respective schools were present, and the meetings were characterized by the dignity and decorum consonant with such learned and august bodies.

The Debt of Russia.—According to the U. S. Economist, the deposits and circulating paper for which the Government of Russia is responsible, including the recent issue of 70,000,000 roubles, or $52,500,000, amounts to the incredible sum of $913,710,000 in addition to its funded debt of 326,675,853 silver roubles, or $245,070,000. The debt of Russia has originated mostly since the war of 1815.

Antiquities of Chicago.—One of the Chicago papers states, that the oldest inhabitant born in Chicago, and now living there, is a lady only 22 years of age. The editor, not yet enjoying her acquaintance, ventures to incur her displeasure by the statement, that the "oldest native inhabitant" of Chicago, a city of more than sixty thousand people, is Miss Ellen Hamilton, the daughter of Col. R. J. Hamilton.

Emancipation in Venezuela.—A late arrival from Maracaibo brings news of an official proclamation by which the 19th of April was appointed as the day for the liberation of the slaves of the Republic. So that, before this time, Venezuela has become a free State in fact as well as in name.

What will the Vegetarians Say?—According to Farnham Bossuet and La Grange, the richest and most comfortable nation is that which eats the most meat. At the present prices of the article we should think it was. A poor nation could not indulge in the luxury.

News Paragraphs.

☞ A colored man while plowing on the farm of Mr. H. Bolster, about a mile from Richmond, Va., struck an old iron pot containing a number of Mexican dollars, amounting, it is said, to $150 or $200. The deposite of this treasure was said to have been made by an old man named Jas. Housen, a creole, who was possessor of this farm for several years previous to 1816.

☞ Messrs. Wright, of Birmingham, England, have recently patented a rope, constructed of hemp and galvanized wire spun together by machinery; and a rope so manufactured, four and a half inches in circumference, was found on trial capable of drawing three hundred tons weight, which required two engines to propel it.

☞ On Monday afternoon of last week, during a heavy rain and thunder storm on Long Island, four laboring men, at work at the clay banks at Glen Cove, were struck by lightning, and prostrated. One of the men, it was feared on Monday evening, would not recover from the shock.

☞ At Spring Creek, on the Illinois Central Railroad, 5,000 cords of wood, cut and piled up for use of the locomotives, may be seen in one heap. The land from which it was cut was purchased by the Company for $30 per acre, and the wood is now worth more than this money.

☞ The "Society for the Relief of Aged and Destitute Clergymen" lately chose a committee of six, to interrogate ministers concerning their salaries. From more than a thousand ministers have they received replies, which will soon be given to the public in pamphlet form.

☞ The Hudson's Bay Company and the Puget's Sound Agricultural Company have proposed to sell to the United States their rights and interests in the wild territories they occupy. Governor Stevens, of Washington territory, is very anxious to have them bought up.

☞ M. Emile de Girardin, of La Presse, has gained his suit in the libel case against Eugene Mirecourt, for his misrepresentation of him in a biographical notice. George Sand is also at sword's point with the same gentleman for having taken her life (biographically.)

☞ It is estimated that the production of railroad iron at the various mills in this country, for the year 1854, will amount to 160,000 tons; number of men in whom employment will be given, 18,500; capital employed in railroad iron works, now erected, $10,000,000.

☞ A very large eagle was shot in Petersburg, Va., last week, after it had destroyed 18 lambs on one farm. The bird proved to be what is known as the American eagle, of great dimensions, measuring six feet and eight inches between the tips of his wings.

☞ The Census shows a population of 112,000 in New Orleans, of whom about one half were born in foreign countries. New York has contributed to the American population of the city about four times as many as any other State, except Louisiana.

☞ The Illinois Central Railroad Company have dug a well at Nora, that would have done honor to the ancients. It is 12 feet in diameter, 70 feet deep, and now contains 50 feet of pure water. The most of the way it is dug in solid rock, and cost $5,000.

☞ The election in Iowa takes place on the first Monday of August, and is the next to occur. A U. S. Senator is to be chosen by the Legislature about to be elected, in place of Gen. Dodge, whose term of service expires on the 4th of March next.

☞ The mail line, from Fort Independence to the Mormon city, and thence to Sacramento, is to be abandoned, and in place of it, is to be substituted a line from the Mormon city to San Bernardo or San Diego, thence coastwise to San Francisco.

☞ Prof. Jameson, the celebrated naturalist, died a short time since at his residence in Edinburgh. He was Professor of Natural History in the University of Edinburgh, and editor of Jameson's Journal, a famous magazine devoted to science.

☞ The rumor that Lord Elgin is to succeed the Marquis of Dalhousie, as Governor-General of India, is strengthened by the fact stated by a Canada paper, that he is returning from Europe without his family, who went out with him.

☞ A tremendous storm of wind and rain occurred at Wheeling, Va., during the prevalence of which the large wire Suspension Bridge was blown down and turned completely over. Considerable other damage was also sustained.

☞ Russia is the greatest unbroken empire for extent that ever existed. It occupies vast regions of Europe and Asia, and forms nearly one-sixth of the habitable globe. It is 41 times the size of France, and 138 times that of England.

☞ A Zurich trading house has founded, in the canton of Zug, an establishment for the distillation of turf-yielding ammoniac, nitrogen, naphtha, acid of vinegar, paraffin, supplying ingredients for candles, camphene and burning gas.

☞ There were 231,791 soldiers engaged in the Revolutionary war. Of this number, there are now less than fourteen hundred living, whose ages must average nearly ninety years.—Seventy-five have died during the past year.

☞ By a recent act of the Wisconsin Legislature, where no special agreement is made to the contrary, fifty-six pounds of flax, forty-six pounds of timothy seed, and fifty pounds of potatoes shall be called a bushel.

☞ John Hancock, of Boston, (a nephew of the Signer of the Declaration of Independence,) who is nearly 85 years old, fell accidentally upon the side-walk on Saturday week, and was carried home insensible.

☞ The three oldest members of Congress are Col. Benton, of Missouri; Col. Bell, of Tennessee, and Hon. Edward Everett, of Massachusetts—all men of eminent talent, ripe scholarship and vast experience.

☞ It is stated that the Czar has insurance to the amount of £20,000 on the lives of Irish gentlemen who were indebted to Harman & Co., who banked extensively at Cork, Limerick, Belfast and Waterford.

☞ The Board of Excise of the village of Rome, have refused to grant any licenses in that village. The vote stood 5 to 1. Four druggists have been licensed to sell alcoholic liquors for medicinal purposes.

☞ From twenty to twenty-five deaths from cholera occurred among some German emigrants, on their way from New Orleans to St. Louis, on board the steamer Dresden, which arrived recently at St. Louis.

☞ Typhus fever is making frightful ravages among the troops at Kalafat. Four thirty to forty deaths are reported, and if its course is not speedily checked, it will prove as formidable a foe as the Russians.

News Brevities.

—— A lady was killed by lightning during a late thunder storm at Washington.

—— An annuity of £100 a year, has been collected for the benefit of the Madiai.

—— About one thousand persons are killed annually in the mines of Great Britain.

—— Herr Drieshach, the lion tamer, has been led to the Hymenial altar by a Buckeye belle.

—— Throughout Douro, (Portugal,) the vine disease is said to have made its appearance in a serious form.

—— A movement is on foot for the erection of a statue, in Edinburgh, to the memory of Professor Wilson.

—— So great is the demand for substitutes in the French army, that the price ranges from 1,000 to 4,500 francs.

—— A Convention of the surviving soldiers of the war of 1812, will be held in Syracuse on the 20th of June next.

—— The Free Church Society in Canonsville have invited the Rev. Miss Antoinette L. Brown to become their pastor.

—— On the 8th of April a fire occurred at Salonica, which laid waste in less than 600 houses and warehouses.

—— Col. Benton's St. Louis Democrat announces him as a candidate for re-election to the House of Representatives.

—— The ship Sophia Walker sailed from Hampton Roads on the 19th for Liberia, via Savannah, with 213 emigrants.

—— Dr. Smith, of Virginia, will probably be one of the new Methodist Bishops, South, and Dr. Pierce, of Georgia, another.

—— Reschid Pasha is said to have stated that he will never allow either Kossuth or Mazzini to enter the Turkish dominions.

—— A druggist at Prorins, in France, has discovered a process of obtaining saltpetre from the roots, leaves and stalks of borage.

—— Emigrants are pouring in upon us in a flood. During Thursday week, no less than 12,476 arrived at the port of New York.

—— The Massachusetts Legislature has appropriated $1,000 to the National Monument on Independence Square, Philadelphia.

—— The Ogdensburgh Republican chronicles the death of a horse that had been worked in that village for upwards of thirty years.

—— It is said that in England and Scotland there are 1,800,000 houses, each, on an average, containing 2,000 cubic feet of masonry.

—— A party of both sexes, from Nova Scotia, passed through Buffalo a few days since, on their way to Utah, to join the Mormons.

—— The wall of a burned building in Baltimore, blew down on Wednesday week, killing two men who were passing along the street.

—— The fly is ravaging the tobacco crop in different portions of the State of Maryland, and it is said that serious damage has been done.

—— The Dubuque Tribune says several persons left Iowa State for Nebraska, but were obliged to return, emigration being prohibited.

—— An enormous mass of amber, two feet long, one and a half broad, and one foot thick, the largest ever found, has been discovered in Denmark.

—— The Archbishop of Paris has issued a circular for the better observance of the Sabbath, which has caused a great sensation throughout France.

—— An eccentric old bachelor died at Hull lately, and the condition upon which his descendant holds the property is, that he will never marry.

—— The editors of Illinois, in a late State Convention, drafted a memorial to Congress against increasing the rates of newspaper and letter postage.

—— The clipper ship Bald Eagle, reached New York lately in seventy-eight days from San Francisco. This is, we believe, the quickest trip on record.

—— A solution of iodine is reported by M. Bernard, of the Academy of Sciences, in Paris, to be an antidote to the venom of the bite or sting of serpents.

—— The people of Brantford and Paris, C. W., have raised the necessary subscription to rebuild the Railroad Depot at Brantford, lately destroyed by fire.

—— A meeting of the citizens of New York was held recently to get up a suitable testimonial to Capt. Fitch, of the Washington, for rescuing shipwrecked passengers.

—— The cholera is making visitations here and there along the Missouri and Mississippi rivers, and also on the Ohio. So far, it has not proved very formidable.

Madame St. Arnaud, the wife of Gen. Arnaud, takes with her no less than sixty dresses of the latest Parisian fashion, to make a proper appearance at Constantinople.

—— All the parties implicated in the late duel at Oak Spring, California, which resulted in the death of Dr. Dickenson, have been indicted by the Grand Jury for murder.

—— The Whig Legislative Caucus of Connecticut, have nominated Francis Gillette, Free Soiler, for U. S. Senator for the short term, and L. S. Foster, Whig, for full term.

—— There are now residing in San Francisco near 1500 colored persons, who own property to the amount of $1,000,000. Generally speaking, they are civil and industrious.

—— The State Times says that Gen. Persifer F. Smith was to be married on the 18th ult. at Corpus Christi, to Mrs. Armstrong, widow to a son of the late Gen. Robert Armstrong.

—— At a meeting in England lately, Mr. Postgate stated, that if asked what commodities are unadulterated, he could but reply, only raw materials—fish, flesh, and vegetables.

—— The Petersburgh, Va., Intelligencer, says that the peach crop in that region has been wholly destroyed by the frosts, but that other fruits are very luxuriant and promising.

—— A Cincinnati paper says that a ladies' association of "Do-Nothings" has been organized in that city, as a fitting counterpart to the masculine order of "Know-Nothings."

—— The following notice was observed on the door of one of the churches in London: "It is particularly requested that moustaches be not worn in this church during Divine service."

—— The ancient African Funtenah, said to have been the slave of Gen. Washington, and now aged *one hundred and twenty years*, is on exhibition at Cincinnati. Where is Barnum?

—— Of the fifty-three and a half millions of people which Russia contained in 1842, not less than forty-two millions were slaves; and of these, fifteen millions were slaves to the crown.

Literary Notices.

THE RUSSO-TURKISH CAMPAIGNS OF 1828 and 1829.—With a View of the Present State of Affairs in the East. By Col. CHESNEY, R. A., &c. With an Appendix and Maps. Reprinted, New York.—1854.

One benefit of no small moment will result from the present war between Turkey and Russia—for all the civilized world, if not "the rest of mankind," may soon become familiar with the history of those countries and their governments. Among the many works tending to this result, Col. CHESNEY's is one of the most interesting and valuable. His long residence in the dominions of the Sultan, while surveying the rivers Tigris and Euphrates, and location at the seat of war in European Turkey in 1829, render him peculiarly qualified to form correct views relative to Eastern affairs. The volume gives a clear history of the former war, and the causes of the recent breach between Russia and the Ottoman Empire. An Appendix contains the Diplomatic correspondence between the four Powers, and the Secret correspondence between the Russian and English governments. For sale by DEWEY.

LIFE AND SAYINGS OF MRS. PARTINGTON, and others of the Family. Edited by B. P. SHILLABER, of the Boston Post. J. C. DERBY, New York.—1854.

WHEN our friend DERBY left Auburn for a wider and more appropriate sphere of action we "reckoned" that his enterprise and reputation would enable him to cope successfully with the best-established Metropolitan publishers—and his first New York book proves that we were not mistaken. It is a perfect beauty in typography, illustrations, &c., and fully proves that "some things can be done BETTER than others." And the *contents* of the volume are equally rich; and those who wish to possess the *genuine* scintillations of the sententious Mrs. PARTINGTON—the most popular Yankee institution of the day—will govern themselves accordingly. For sale by WANZER, BEARDSLEY & Co.

THE MYRTLE WREATH, or Stray Leaves Recalled. By MISTIE MYRTLE. CHAS. SCRIBNER, New York.—1854.

This is an excellent volume, comprising numerous sketches, in prose and verse, originally contributed to the N. Y. Times, Independent, National Era, and other periodicals. Though apparently clothed in the garb of fiction, the author asserts that "Imagination and fancy have had little to do with these sketches—her motto is Truth." The work certainly embraces many beautiful sketches of elevated moral tone, and as such, is worthy of commendation. The volume comprises nearly 400 pages, and is published in Scribner's best style. For sale by DANSON & BROTHER.

THE EDINBURGH REVIEW—for April, 1854. Re-published by LEONARD, SCOTT & Co., New York.

An excellent number of a Review which is always able and readable. The first article, on Mormonism, will be read with peculiar interest at the present juncture. Those entitled "JOHN LOCKE—his Character and Philosophy," "History of the French Protestant Refugees," and "Consumption of food in the United Kingdom," will attract attention. For sale by DEWEY.

A DEFENCE OF THE ECLIPSE OF FAITH, by its Author; being a Rejoinder to Prof. NEWMAN'S "Reply." Also, the "Reply" to "The Eclipse of Faith," by F. W. NEWMAN; together with his Chapter on "The Moral Perfection of Jesus," re-printed from the third edition of "Phases of Faith." CROSBY, NICHOLS, & Co., Boston.—1854.

This lengthy and somewhat comprehensive title gives an idea of the discussions comprised in a handsome volume of some two hundred pages. For sale by WANZER, BEARDSLEY & Co.

STOP THIEF!!—The following interesting notice is taken from the Pennsylvania Gazette, of February 22d, 1738:

STOLEN.—On the 15th inst. by one William Lloyd, out of the house of Benj. Franklin, an half-worn Sagathee coat, lined with silk, four fine Linnen shirts, a fine Holland shirt, ruffled at the hands and bosom, a pair of black broadcloth breeches new seated and lined with leather, two pair of good worsted stockings, one of a dark color and the other of a lighish blue, a coarse Cambric handkerchief, marked with an F. in red silk, a new pair of Calf-skin shoes, a boy's new Castor hat, and sundry other things.

N. B. The said Lloyd pretends to understand Latin and Greek, and has been a schoolmaster; he is an Irishman, about thirty years of age, tall and slim; had on a lightish colored great coat, reel jacket, a pair of black silk breeches, an old felt hat, too little for him, and sewed on the side of the Crown with white Thread, and an old dark colo'd Wig; but may perhaps, wear some of the stolen Clothes above mentioned.

Whosoever secures the said Thief so that he may be brought to Justice, shall have *Thirty Shillings* Reward, and reasonable charges paid by B. FRANKLIN.

ARREST OF A FUGITIVE SLAVE.—A colored man, named James Worthington, was arrested in Akron this morning, by Deputy Marshal Denis.—The whole town turned out to the aid of the alleged fugitive; a great excitement prevailed, and the man was rescued, and delivered to his friends. In connection with the criminal charge of being a slave, was the trumped up of counterfeiting. Of course this was false, as the man has lived in Akron fifteen years, and has an irreproachable character. The citizens said to the Marshal that if Worthington was charged with crime committed in Ohio, he should answer to the laws, and be put under preliminary examination, and all aid rendered to the officers in the matter; but if he was accused of taking care of his own personal liberty only, he should never be taken from Akron. The Marshal saw fit to leave on the first train.—*Cleve. Herald*, 18th.

EMIGRATION FROM LIVERPOOL.—From the Government emigration returns, we learn that 31,500 emigrants left Liverpool during month of April, for Canada, Australia and the United States, being the greatest number ever known to have left the shores of the Mersey in one month; and the present month bids fair to exceed in numbers that of the past one. The new American clipper ship Red Jacket, Capt. Reed, sailed from the Mersey for Melbourne with sixteen cabin and 436 second-cabin passengers.

Foreign Intelligence.

Arrival of the Europa.

THE Europa arrived at New York, May 19th. The bombardment of Odessa is fully confirmed. The batteries were all destroyed. Twelve Russian vessels destroyed, and thirteen laden with ammunition captured, the lower and central property spared. The combined fleet have left for Sebastopol. The Turks have captured Petti, the principal point of the Greek insurrection.—The insurgents had one hundred and fifty men killed. The Russians have been defeated in an encounter between Silistria and Rasova. The Turks also made a gallant attack upon Silistria, but were compelled to retire, owing to the overpowering strength of the Russians.

It is stated that Omar Pacha, on the 18th or 19th of April, advanced with 70,000 men toward Dobrudscha, and a battle took place with Gen. Luder's corps, between Silistria and Rasova.

A Polish Legion, to operate against the Czar, has been established in Turkey. The Russian fleet is said to have left Sebastopol.

No fighting in the Baltic. The fleet was closely blockading all the Russian ports.

On the 19th much excitement was produced by the publication, by the London Herald, of the following paragraph:

"News has reached the Admiralty that an American clipper, the Grape Shot, has captured a French merchant ship off the Land's End.—The Grape Shot cleared out of New York on the 22d for St. Thomas, with 1500 packages on board, professedly of hardware, but really containing muskets, supposed to be bound to Finnland, and failing of debarkation there, for the Mediterranean."

Arrival of the Franklin.

THE steamship Franklin arrived at New York May 22d, with dates from Liverpool to May 10.

The Franklin brought 130 passengers, and among them M. DeCuria, Minister from Spain, and Mr. Winslow, special bearer of despatches from Spain.

When off Nantucket Shoals in the fog, the Franklin came in contact with the propeller William Penn. No serious damage done.

It was understood that Lord Elgin was charged with a special communication from the English Government to the President of the United States.

No news of exciting interest from the seat of war.

The Arctic had not been telegraphed on the sailing of the Franklin.

There is nothing important from the Black Sea or the Danube.

A camp of 100,000 men is to be formed near St. Omers—partly as a demonstration against Prussia, and partly to throw troops thence into the Baltic when necessary.

The Russians had evacuated Krajova, and had offered a new proposition to Austria, but it had not been received.

COMMERCIAL NEWS.

BREADSTUFFS.—Richardson reports extensive demand for Flour, and despite the large importations, an advance of 12½ on really fine Philadelphia, Ohio and Baltimore—sales having been made at 39@40s. Indian Corn in better request and recovered 1d of last week's decline.

PROVISIONS.—McHenry reports Beef advanced and Pork very firm. Bacon moves freely and the decline is seemingly arrested. Lard in good demand at previous prices.

STAMPEDE IN THE ILLINOIS PENITENTIARY.—The Alton papers last received contain full accounts of the attempt of several convicts to escape from the penitentiary in that city. Thursday afternoon, as the convicts were returning from the dining hall to the work shops, four of them suddenly made a break for the wall, and throwing against it a long beam which lay in the yard, climbed in the top, jumped over, and endeavored to make their escape across the bluffs. The guard in the guard-box at the time gave the alarm, and at the same time fired five or six guns at them. Two were shot in the arm, one above and one below the elbow. A number of citizens immediately started in pursuit, and succeeded in capturing three of them.

MUNIFICENCE OF A SINGLE LADY.—Miss Caroline Plummer died at Salem on the 15th inst., at the age of 74 years. By a course of rigid economy and self-denial, she had accumulated a fortune of $100,000. By her will she bequeathed more to public uses than has ever been left by any resident of Salem, viz., the sum of $15,000 to Harvard College, to found a "Professorship of the heart," i. e. for Moral Philosophy; the sum of $30,000 to the Salem Athenæum, and (after other private bequests) the residue of her estate, which will probably be about $30,000, to found a Farm School at Salem.—*Bos. Transcript.*

☞ The citizens of St. Louis city and county, by much the largest vote they have ever given on any question of internal improvement, instructed the County Court on the 6th inst. to subscribe $1,200,000 to the stock of the Pacific Railroad, and to pay the same by the levy of a *direct tax* on the property of themselves, the citizens, so voting.

☞ Resolutions have been adopted by the Medical Society of Berks County, Pa., directing the members of the Society to furnish to their Secretary a list of such of their patients as do not pay their doctors' bills.

SPECIAL NOTICES.—TO AGENTS, &c.

☞ AGENTS.—Any person so disposed can act as agent for the RURAL NEW-YORKER,—and all who remit according to terms will be entitled to premiums, &c.

☞ THE RURAL is published strictly upon the CASH SYSTEM—sent no longer than paid for—and all orders should be in accordance with terms.

☞ OUR *lowest* club price is $1,25 for any number of copies over 20—and $1,50 under that number, unless a full club of twenty is obtained.

☞ In making up clubs for the RURAL, the Wool Grower and Stock Register can be added at 35 cts. a copy, which is the lowest club price.

☞ In writing us, please be particular to give your P. O. address correctly—the name of your Post Office (not Town,) County, and State. Write all names plainly.

☞ Those wishing their papers changed from one address to another, should give the names of both post Offices—the *former address*, as well as the one desired.

☞ ADDITIONS to clubs may be made at any time, at the price per copy paid for the original club.

☞ EXTRA numbers of the RURAL will be forwarded to all disposed to aid in augmenting its circulation.

Commercial.

BUSINESS AND FINANCE.

THERE has been no arrival from California since our last. The Africa, for Liverpool, May 17th, took out $346,091 80 and the Washington, on Saturday the 20th, $736,745 which sums together fall short of the last California arrivals, by more than half a million. Another steamer will also be due from the Isthmus before another European steamer calls. The whole amount of coin and bullion exported thus far, this year, is upwards of eleven and a half millions.

The Secretary of the Treasury gives notice that the time of redemption of U. S. Stocks not due, and the premium offered therefor will be extended to the first of July next.

The New York Central Railroad has advertised for a loan of $3,000,000, for which bonds of the company will be given, convertible into stock. This loan is to be applied to finishing the double track through from Albany to Buffalo, building suitable depots and providing an increase of rolling stock, after which this will be one of the most perfect, as well as the most gigantic railroad corporations in existence.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE, Rochester, May 24, 1854.

No change in Wheat and Flour, and nothing doing in either. Corn rules the same as at previous quotations, but offers are scarce and still higher, fifty-four cents being offered by wholesale purchasers.

Butter, which of late has been scarce and high, is in better supply and prices are falling daily. Fourteen cents is all that is offered to-day.

Hay more plenty and price lower, selling from $12 to 15; other thing and generally changed.

Prices of meats merely nominal, as none is offered in the market except retail, by the butchers, who purchase the animals on the foot.

Rochester Wholesale Prices.

NEW YORK MARKET—May 22.

FLOUR—After the reception of the Steamer's news holders generally disposed to insist upon better prices, but upon the assertion manifested a desire to accept the figures current in the early part of the day. Sales inferior at $5@5,12; common to straight State $5,31@5,44; choice do. $5,25@5,75, and common to good Ohio and mixed to fancy Michigan. Canadian flour is in fair demand, with sales at $7,15. Fair request for Rye flour at $5,25.

GRAIN—Wheat market does not present any new feature. Seller very good Canadian at $2. Supply of Rye limited and market firm—sale at $1,12½ in the ship. Barley continues in good demand; sales prime four-rowed at $1,20. Corn market firmer—since the news, 2 and 3 cents adv. is asked. Sales at 64@66c for inferior western; 67@71c for good to prime do; 64@67c for round yellow. Oats lower, with sales at 51@52c for State, and 52@53c for Western.

PROVISIONS—Pork market without change and no moderate demand. Sales at $14 for mess; $12,44@12,50 for prime. Lard steady; sales at 9@9¾c. Butter and Cheese without change.

ALBANY MARKET—May 22.

FLOUR AND MEAL.—The market for Western and State flour opened dull. The receipts are not large, and the demand is mainly confined to small parcels for immediate consumption. Sales at $5,25@5,75 for common to good State and common Western. Corn Meal is rather lower, with a firm inquiry, at $1,31@1,44 ₩ 160 lbs.

GRAIN—The supply of Wheat is not large but buyers rule the market. Sales red western, at $1,94, and choice white Michigan, afloat, at $2,20. Corn is without important change. Sales at the Boston depot, at 66c. for round yellow and Western mixed. Oats are very scarce and wanted,—sales State at 53½c.

BUFFALO MARKET—May 22.

FLOUR—The market is very quiet this morning and the sales do not exceed 500 bbls. at $5,75@5,87½ for good to choice brands of Ohio, Michigan and Indiana.

GRAIN—Wheat in better supply, but holders are firm and above buyers' views. White Ohio is held at $2,10,—Milwaukie $1,68@1,85. Corn continues dull, buyers offer 50@51c., holders ask 52c. No sales.

Canal freights firmer, at 5s@60c. on Flour, and 11c. on Wheat to New York.

NEW YORK CATTLE MARKET—May 15.

AT Washington Brove Yard—Offered during the week 2,243 Beef Cattle. Prices, &c.—The market for Steers has given away a little since our last, say 50c per cwt. A good show of Cattle at all the markets. We quote:—Beef Cattle $9@11; Cows and Calves $50@90; Veal Calves 4@5½c per lb; Sheep $4@10; Swine (corn fed) 3½@4c per lb.—About 200 Heifers left over.

At Browning's—Prices at this market show a decline on Beeves of $1 per cwt. on the better qualities, but prices for poorer sorts remain unchanged. Sales at $8,50@11,50 per 100 lbs. for Beeves; Cows and Calves sold at from $32 to 60. Veal sold at from 3½ to 5c per lb., live weight. Sheep range at from $3,50 to $6. Lambs at $3 to $6.

At Chamberlain's—Prices of Beef ranged at from $9 to $11,50 per 100 lbs. Cows and Calves have also advanced,—sales at from $30 to 70. Sheep at from $1 to $8. Lambs at $2,50 to $5.

At O'Brien's—Sales of Beeves at $9@11,50. Cows and Calves at from $35 to $45.

ALBANY CATTLE MARKET—May 22.

At W. Woolford's Bull's Head, Washington street.—Beef Cattle—321 at market. Prices—Extra $8,50; 1st quality $8; 2d do, $7,50; 3d, $7.

Cows and Calves—8 in market. Prices range from $30 to $40@60.

Sheep and Lambs—505 in market. Prices range at from $4,00 to $6,50.

Swine—Few in market. Selling from $4 to $4,50.

CAMBRIDGE CATTLE MARKET.—May 17.

At market 330 Beeves, 24 Stores. Market Beef—Extra, $9 per cwt.; 1st quality, $8,50; 2d do, $7,50@8; 3d do, $7,25; ordinary, $6,50@7. Hides, ₩ cwt. $6,00@6,50. Tallow $8,25@8,50. Pelts, $1@1,75. Calf Skins, 13c ₩ lb. Veal Calves from $4 to $7.

STORES—Working Oxen—$88 to $154@167.

COWS AND CALVES—$31 to $57@68. Two years old—$36 to $49. Three years old—$41 to $68.

☞ The Wool Grower and Stock Register is the only publication in the United States exclusively devoted to wool and stock growing. It is the *Vade Mecum* of every enlightened sheep farmer from Maine to Texas, containing the only reliable information as to information as to prices, and will be found absolutely indispensable to those who are about to embark in the business. It is a monthly of 16 pages, and is sent to subscribers at the ridiculously low rate of 50 cents a year.—*Piedmont (Va.) Whig.*

The Wool Grower and Stock Register is worth $10,00 a year to every one engaged in raising stock. It is furnished for fifty cents.—*Family Visitor.*

TENTS FOR AGRICULTURAL EXHIBITIONS, &c.

TACKLES AND STACK COVERS—ICE HAMMERS!

THE subscriber, who for many years, has furnished *Tents* for the New York, Pennsylvania, Ohio, and other State Fairs, has on hand a great number of TENTS, suitable for County or State Agricultural Fairs, which he will sell at a moderate price, or RENT, as may be desired.

Also, a large number of CAMP MEETING TENTS, of Duck, sufficiently light to resist water in the severest storms. All Tents intended for more than one Family, will be furnished with canvas curtains, or partitions, and the outside curtains are so arranged, that they may be closed so or in entirely exclude the night air. Also, HANDY TACKLE, for Farmers, a most useful article. For killing hogs, weighing hay, drawing logs and many other purposes, they are invaluable. Those having used them consider them almost indispensable. No. 1, filled up with 40 feet of good rope, $3,75; No. 2, filled up with 40 feet of good rope, $4,15.

Also, STACK COVERS, an excellent article for preserving Grain, &c., from rain. No farmer can afford to do without these covers, as often more than four times their cost is saved in one season.

☞ All orders, letters of inquiry, &c., (post-paid,) will receive a prompt attention.

Address E. G. WILLIAMS,
229-41 No. 12 Buffalo st., Rochester, N. Y.

SCRIBNER'S READY RECKONER,

For Ship Builders, Boat Builders, Lumber Merchants, Farmers and Mechanics.

Being a correct measurement of Scantling, Boards, Plank, Cubical Contents of Square and Round Timber, Sawings, Wood, etc., comprised in a number of Tables; to which are added Tables of Wages by the month, Board or Rent, by the week or day, Railroad distances, &c. Also Interest Tables, at seven per cent.

BY J. M. SCRIBNER.

Author of "Engineer's and Mechanic's Companion," Engineer's Pocket Table Book, etc., etc.

Scarcely is it possible to add to the recommendations of the above book, more than to give its title page. Every one who is engaged in buying, selling, measuring or inspecting lumber of any kind, will at once appreciate a work of this kind. No pains or expense has been spared to revising and enlarging this edition, to make it in every respect, correct and accurate.

The Log Table was computed by drawing Diagrams, for each and every log, from 12 to 44 inches in diameter, and the width of each board taken, after taking off the wane edge. The sum total of each board constitutes the amount each log will give, and if there can be any dependence placed upon such strictly mathematical accuracy, no one will hesitate for a moment to abide the results here given, as the method adopted by the author can result in nothing else than strict honesty and mathematical accuracy, to the parties interested.

The best evidence of the usefulness and popularity of this book is the extensive sale it has had all over the United States and Canada, having sold about *ONE HUNDRED THOUSAND COPIES!* in a few years, which is, by far, the largest sale of any book of the kind ever issued from the American Press.

I do not hesitate to say that no book of its size and price contains more useful or correct tables.

In all new and lumber countries the book will be found very convenient, as it comprises much that is useful for the Farmer, Mechanic and Business Man.

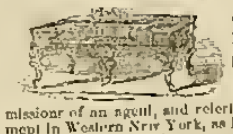
Orders solicited, from Agents, Booksellers, and others, to whom a liberal discount will be made. ☞ Price, 25 cents. *Five Copies* sent to one address for *One Dollar*, postage paid. The books can be had of Booksellers generally, throughout the United States.

GEO. W. FISHER, Publisher.
Rochester, N. Y., May, 1854. 229-13w3m

3,500 ACRES OF LAND, with Steam Saw Mill, for sale in Scioto Valley, Ohio, and lying on the Ohio Canal. The Land will be divided to suit purchasers. For particulars inquire of NOAH & BROWNELL, or U. H. NOAH, Piketon, Pike Co., Ohio, May 17, 1854. 229-3t

BRAHMAS.—Having obtained as many Brahma eggs as I can conveniently set, I would sell, and at a cheap price, two roosters and four pullets. They are 9 months old—splendid birds,—pure and genuine, derived from the Hartford stock. D. ELY,
May 20, 1854. 69 Fitzhugh St., Rochester, N. Y.

STARR'S PREMIUM PIANO FORTES.



EVERY person in this vicinity, desirous to purchase a Piano Forte, will be *more than paid*, by visiting my rooms, where he can *buy directly of the manufacturer*, save the commission of an agent, and select from the largest assortment in Western New York, as I have constantly on hand from 15 to 30 finished instruments, and from 50 to 100 others in process of construction, of various sizes, patterns, and prices, from $230 to $700 each. They embrace such a combination of excellencies, in their beauty, finish, strength, (to keep in tune,) exquisite touch—soft, deep, rich, full and melodious tones—as induces the belief, so often expressed by war acknowledged critics one of the most intelligent musical communities which ever acted on a similar occasion, *awarded us the three highest premiums*, when in competition with Chickering, Hilbert, Bacon & Ravens, Wm. Hall & Sons, at the New York State Fair for 1851.—Their *reliability*, fully justifies the report of that commission. They are manufactured of the best materials, in the most perfect manner, with metallic plates, upon the Iso Chordal scale, with the Iron Baton Damper, and French Grand Action, *expressly for retailing*—(numerous applications at wholesale, being constantly refused,) and can only be had at my rooms, where the instruments will be shown, and all orders promptly attended to. As it is fully settled that a *good Piano is cheap at almost any price*, and a poor one only a nuisance; and as I rely alone upon their merits to secure their favor with the public, I invite for them, the most careful examination and scrutiny, by all who wish to buy, at my manufactory and ware rooms, Nos. 45, 47, 49, and 51 Orphean Buildings, Main st., 2d Floor. Every instrument will have upon it the name of the subscriber, and be *warranted to please the purchaser*.

FREDERICK STARR.
Rochester, May, 1854. 229

FOREIGN PATENTS.

THE undersigned continues to act as Solicitor and Agent for procuring Patents in all countries where they are granted. He is represented in Europe by honorable and reliable men, of long and experience, through whom he is enabled to secure Patents in England, Scotland, Wales, Ireland, France, Belgium, Germany, Austria, Russia, Prussia, Spain, Portugal, &c. His facilities for transacting foreign Patent business are unsurpassed. He can generally obtain Certificates of Provisional Protection from the British Patent Office, within six weeks from the time the invention is first communicated to his care. The cost of British and other foreign Patents, to Americans, has been greatly reduced.

The undersigned may be at all times consulted, free of charge, by letter, or personally at his office, in reference to Patents, Inventions, &c. All consultations and business strictly private. For further information, apply to or address ALFRED C. BEACH,
227-4t Solicitor of American and Foreign Patents,
People's Patent Office, 56 Nassau-street, New York.

KETCHUM'S MOWING MACHINE.

This machine stands without a successful rival, as *the mowing machine of the age*. The supply will not be equal to the demand. If any person desires one for the coming season, they cannot speak too soon. The uniform price at Buffalo is $110,00. All who will forward us an order accompanied with the cash or satisfactory reference, may depend upon being faithfully served with a machine in good season. H. C. WHITE & CO.,
Buffalo Ag. Warehouse and Seed Store, 11 & 13 West Seneca street, Buffalo, N. Y 211tf.

GARDEN SEEDS.—We have a full and fresh supply of imported and best Shaker Garden and Field Seeds—Merchants and dealers supplied on the most favorable terms. Catalogues gratis. Orders solicited at the Buffalo Ag'l Warehouse: (223tf) H. C. WHITE & CO.

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

THE FACT that the circulation of the W. G. & S. R. has more than *trebled* during the past two years, and is daily increasing, induces us to venture an enlargement and improvement, which will at once render the work far more acceptable and valuable, if not indispensable, to all engaged in Wool Growing, the breeding of improved Stock, or the rearing of Domestic Animals generally. Though our arrangements are not entirely completed, we can safely announce that—

On the commencement of its Sixth Volume, July, 1854, the WOOL GROWER AND STOCK REGISTER will be enlarged to THIRTY TWO PAGES monthly, printed upon new and handsome type, and essentially improved in other respects. The Yearly Volume will comprise 384 octavo pages, or *double* the number contained in the present, (exclusive of the advertising cover, which will probably be omitted.)—This will give ample room for the discussion of many subjects which require attention, but which we can scarcely notice with our present limited space. Among other matters, we propose to publish Pedigrees of pure bred cattle, horses, sheep, &c., and to give the owner, residence, &c., of the principal breeders of improved Stock throughout the country—for the mutual benefit of owners and those desirous of purchasing.

Arrangements are making to improve the *quality*, as well as increase the amount of reading matter. Regarding the reliability and value of its CONTENTS as of far more importance than the size or appearance of the paper, we shall endeavor to secure the assistance, as contributors to its pages, of the best and most experienced writers on the various subjects discussed,—and cordially invite the co-operation of all disposed to aid in enhancing its value and usefulness.

Although we hope to double the *value* of the paper, its subscription price will not be increased—except perhaps to clubs of 20 or over. Single copies will be furnished at Fifty Cents—5 copies for $2, and 8 for $3. ☞ The first five volumes, bound in colored paper, will be sent post-paid, and the numbers of the 6th volume as issued, for $3.

The attention of all interested in the subjects and objects of a Stock Journal, is respectfully solicited. The readers of the RURAL NEW-YORKER are especially invited to give the W. G. & S. R. an examination, and, if approved, their encouragement. Specimen numbers, &c., cheerfully sent, gratis, to all applicants. Address

May, 1854. D. D. T. MOORE, Rochester, N. Y.

CALCINED BONES.

THE subscribers have some hundreds of barrels of calcined bone-dust, a valuable manure, which will be delivered on the Railroad or boat at $1,25 per barrel of three and a half bushels. Orders by mail will receive the most careful attention. [220-3t] H. C. WHITE & CO.

FORBUSH'S MOWING AND REAPING MACHINE.

Patented July 29, 1852.

THE AMERICAN MOWING AND REAPING MACHINE CO. have purchased the Patent Right for the above Machine for the United States, England and Canada, and are now manufacturing a large number to supply the demands of the coming season. The advantages which this machine possesses over all others are obvious, and will readily be acknowledged by all disinterested persons. Being a *combined machine*, and working equally well in grain or grass, it enables the farmer of moderate means to procure a valuable *Reaper and Mower* in one, which will do the work of both, and at less than half the usual cost. As a Mower it has no superior; it was thoroughly *tested* the past season in every variety of grass, and in many different sections of the country, and in every case where it was properly made, it gave perfect satisfaction. It will cut and spread from 10 to 15 acres of any kind of grass per day. As a Reaper it has never been excelled, and has no rival that can in all respects successfully compete with it. The patent for this machine covers many points of excellence which have heretofore been unknown, and which (of course) can be used in no other. In the construction and arrangement of these machines great pains have been taken to insure the necessary strength, simplicity and durability. They are easily kept in order, and it requires but a few moments to change the machine from a Mower to a Reaper, and in either form it is equally strong and substantial. It is not liable to get out of order, and if any accident should happen it could be readily repaired by any ordinary mechanic. In the construction of the machines no expense has been spared to render them both perfect and durable. The Mower weighs but 731 lbs.—the Mower and Reaper combined 900 lbs. To any person desirous of purchasing, or of understanding the machine more fully, illustrated circulars will be sent with full descriptions, references, &c., &c.

Price of the Mower, ... $110 00
" " " and Reaper, ... 130 00

Terms—Cash in Buffalo. Delivered on boats or cars, free of charge.

Address orders or communications to the Company, or CHAS. W. SMITH, *Sec'y*, Buffalo, N. Y.

Further information can be had, and machines purchased of the following Agents:

KETCHUM'S IMPROVED MOWING MACHINE,

WITH ENTIRE CHANGE OF GEAR, THE ONLY SUCCESSFUL MOWER NOW KNOWN.

Ketchum's *Improved* Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: *durability, convenience and ease of action*. The shafts now have bearings at both ends, which overcomes all cramping and coiling away of boxing. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being *on upper side of the frame*; oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its whole width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

It requires not over ten minutes to get one ready for operation, there being but two bolts, (besides the pole bolts,) to be secured to have one ready for use. They will cut *all kinds of grass*, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair; it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make this machine deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying *untried* Mowers; if they do (as was the case with many last year) they will form no ties, revulsion and disappointment.

If any parts are wanted to repair any machine we have sold, or may hereafter sell, they will be furnished and only manufacturers' cost for the same be charged.

☞ In all cases where extras are wanted, be sure to give us *the number of your Machine*.

(WARRANTY:) That said machines are capable of cutting and spreading, with our span of horses and driver, from ten to fifteen acres per day of *any kind of grass*, and do it as well as is done with a scythe by the best of mowers.

The price of the Mower, with two sets of knives and extras, is $110 cash, in Buffalo, delivered on board of boat or cars free of charge.

Office and Shop, corner of Chicago street and Hamburgh Canal, near the Salem R. R. Depot, Buffalo, N. Y.

HOWARD & Co., Manufacturers and Proprietors.

The Mower is also manufactured by RHODES, NORRIS, MASON & Co., at Worcester, Mass., for the New England States.

By SEYMOUR, MORGAN & Co., Brockport, N. Y., for Illinois, Iowa and Michigan.

By HAMAKER & BROSAW, Springfield, O., for Ohio and Kentucky.

J. RAPALJE & Co. are also sole Agents for the sale of Ketchum's Mowing Machine in Rochester, and for their locality. 229-3tw1m

DREAMINGS.

I sat beside the kitchen hearth,
The fire was blazing bright,
The shadows danced upon the wall,
In wavy flickering light.
The kettle hung upon the crane,
And sung a pleasant song;
But which, unlike our modern tunes,
Was neither loud nor long.

I watched the airy silv'ry steam
Before it passed away,
And pictured to myself the joy
Of many a future day;
In that room then was cast around
The shade of coming years;
It was a scene of bright sunshine,
Of misery and tears.

I saw not then with mortal eyes
The shadow o'er me cast,
Life seemed to me a fitful dream,
And one that could not last.
I did not look for company,
For phantoms filled past,
And in the chambers of the heart
The guests were gath'ring fast.

I saw my mother's drop blue eyes
Rest fondly on her child;
I heard my father's manly tones,
In accents soft and mild.
I longed to speak, but yet I *knew*
It was an idle dream,
And all would vanish like the dew,
Beneath the sun's first beam.

At last the fire upon the hearth,
Sent forth its dying gleams,
The kettle's cheerful song was hushed,
Then vanished all my dreams.
I cast aside the golden chains
That bound with mag e pow'r,
Resolving then to *live*,—not *dream*,
Till life's last solemn hour.

"Our Hattie."

[Written for the Rural New-Yorker.]

SOCIETY OF LONE MEN.

BY EDWARD WEBSTER, ESQ.

Students in colleges resort to many expedients for amusement during the four long years they are probationers within the walls of their so-called *Alma Mater*. Some of their expedients are not always innocent, although, as a general thing, they are harmless to all except the actors themselves. Occasionally, indeed, mad pranks are played off upon others, more in thoughtlessness than a spirit of malicious mischief, and injury results therefrom; but such acts are always condemned by nine-tenths of the young men, however much they may all enjoy a good joke, or a successful practical "sell." Thrown together in large numbers without the restraints of home and kindred, or the genial influences of female society, and feeling that it makes very little difference what may be thought of them in that locality of their temporary sojourn, no wonder that many of the college students grow rude, and some of them reckless.

College is an admirable institution for the young man whose principles are fixed, whose desire for learning is earnest, whose pecuniary means are limited, and who feels that a reckless expenditure of either time or money is a crime against his father's household and his own soul,—such an one will always profit by a college course; but the individual who goes there *merely to graduate*, just because his father graduated before him, or because it might seem discreditable in him not to do so, —who has abundant supplies of cash, and makes it a point of honor to spend it profusely, who haunts the livery stable and the billiard saloon more than the laboratory or the recitation-room, who cares enough for rules and requirements just to escape degradation or expulsion and nothing more,—had infinitely better stay away. The four years of the course are worse than thrown away on such a student, and he comes out *unfitted* rather than fitted to take an honorable position on life's great stage. His subsequent career, if not criminal, is usually at least obscure.

Secret Societies in college have been made a mooted question among grave professors and college faculties, as to their good or bad influences upon students. In some institutions they have been formally interdicted, and in many others just barely tolerated, if not actually condemned; but in all such cases they continue to flourish, and will undoubtedly continue to do so. Under certain aspects they are no doubt harmless, while under others they cannot be otherwise than fraught with evil, and that continually. There is no harm, for instance, but great good resulting from a select number of students of congenial tastes and sentiments meeting together in an elegant room fitted up for the purpose, and enjoying an intellectual treat—a debate, a critical disquisition, or an unrestrained conversation; but a meeting in an exclusive club-room for card-playing, for drinking, for plotting the ways and means of mischief and mad pranks, has been the means of ruining many an ingenuous and unsophisticated youth.

There are all shades of these societies, especially in large institutions, from the honorable Phi Beta Kappa, down to the Death's Head, and with objects as varied as the character of the members. One of these (now it is believed defunct) which existed in —— college, was known as the "Society of Lone Men." Its object was ostensibly mutual improvement, intellectually and morally; but its real one was social and convivial enjoyment, and with fun. Care was taken by the members, most of whom were good students, and generally conscientious young men, that the pursuits of the association should not degenerate into vice, or go beyond the point where innocent amusement passes into criminal indulgence: but the practical jokes that were now and then played off, and the fiery ordeals through which the neophyte members were made to pass, were enough to turn a man's hair grey. The descent of Æneas to Acheron was scarcely more terrible. The candidate was led blindfolded, in the night, from the village out into the open fields, over fences, through quagmires and bushes, until quite flagged out, and then brought back to the identical place from whence he started, taken up three flights of stairs to a room enclosed with double doors and partition walls, burning with blue lights and hung around with the insignia of Pandemonium. Here he was made to go through certain forms and ceremonies, after which the bandage was removed from his eyes for the first time,—and such a sight as then presented itself is not often to be seen. Queen Victoria's Court in masquerade dress and hickey costume could not be mentioned in the same day. Horns and hoofs, winged spirits and wizard forms, hideous human faces such as leer at us in the midst of horrid dreams, dresses of uncouth patterns that rarely greet the eye of civilized humanity, bore a conspicuous part. A successful school of design was kept up, in order to supply the proper paraphernalia of these important occasions, and no effort spared to render the ceremony as imposing as possible. More than one candidate under the process of initiation would have given the society leg-bail for his future appearance, if he could only have been brought out on a writ of *habeas corpus*; but the Marshall of the "Lone Men" had executed a *capias*, and made a return thereon, and the unfortunate wight was a prisoner under double lock and bar, and was constrained to submit with as good grace as possible to whatsoever the "powers that be" were pleased to inflict. It was always noticeable that the latest received were the most active in the initiation of their immediate successors.

One of the first and indispensable qualifications, besides those of a companionable character, was that the candidate must have been *crossed in love*; and in the evening meeting next succeeding his initiation, he was required to narrate the story of his heart-sorrows and trials, many of which brought tears to the eyes of the audience; more frequently, it must be confessed, they were tears of excessive merriment, rather than sympathy or grief. It may be considered strange, but so it was, that nearly every individual who was deemed desirable in other respects, never lacked the all-important requisite of heart-desolation, and was therefore prepared with a tale of woe. Whether these narratives were apocryphal, or otherwise, it is not necessary for me to state, nor am I able to do so; but this is true, that time and change of scene had proved wonderful restoratives to the heart-diseases, and one would have sworn, seeing the society together, that sorrow and sighing had been strangers to them from the hour of their birth. A name was given to each novice suggestive of some peculiar trait or idiosyncrasy of character: for instance, the monitor of one class, who had the name among the faculty of being one of the most sedate of men, and was really so except when he unbent in genial society, was christened Argus; another, who could drink more cider than any two other members, was dignified by the name of Bung, and a third, who in a row with a squad of the town boys, had fought and conquered three of them successively, was honored with the name of Knockemstiff — and so on to the end of the chapter.

Whenever a member, after he had graduated and gone forth from College into the world, fell from his high estate—that is to say, took unto himself a wife, as in fact usually was the case—his name was stricken from the roll of living members, a eulogy pronounced upon his memory, and his surviving associates spoke of him tenderly as their poor dead brother.

Some of the autobiographies of the members, or rather that chapter which entitled them to enrollment into the Society of Lone Men, it is our purpose to narrate briefly, one of which is inserted here:

"I never was in love but once," observed one of the Seniors, in a melancholy voice, placing his hand upon his heart, "and I shall never be again. The fountain of my affections is dried up, and ashes are sprinkled over the urn from which the bright and sparkling waters erst did flow. The funeral shadows over my buried hopes, too plainly tell that for them there can be no resurrection." (By-the-by, the fellow was married within six months after he left College, and had an oration delivered in the Society to his memory.)

"Did she die?" inquired a Sophomore, sympathetically.

"Yes, she died to me! that is to say, she turned her back upon me, and married a young blacksmith in our village. He was elevated in a day to Mammon's third heaven, and I was cast down to the lowest depth of misery and woe!"

"How did it happen? How did it happen?" rejoined the sympathetic Sophomore.

"It happened in this way. We were rivals for the girl's love. I was a handsome man, as you see, and he was as stalwart and grim a son of Vulcan as ever wielded a sledge. We hated and despised each other, and the bright girl who had turned our heads, and caused our hearts to melt like toasted cheese, took delight in pitting us against each other. She balanced her favors and her smiles, adroitly keeping the scale in trembling vibration, without, for a single moment, coming to rest. Now it was my star that was in the ascendant, and then the blacksmith's; now my scale would suddenly preponderate, and anon, by some untoward event, it would as suddenly kick the beam.—At last the crisis came that was to decide our fate. I had of late been more favorably received than my rival, and being determined to take advantage of the tide, was unremitting in my attentions. I was striking while the iron was hot, as well as the blacksmith—speaking figuratively in regard to myself, and literally in regard to him. He endured it with a good deal of equanimity I must confess, for he was called an excellent and sensible fellow, by all our mutual acquaintances, although I could not at that time see anything either good or lovable in his huge physical developments.—He could double around his finger two like me; so I had always avoided coming to an open rupture. On the fatal evening that made shipwreck my hopes, I had been out walking with my lady love, and had been making great inroads upon the fortress of her heart; I was sure a breach had been effected in the heretofore impregnable stronghold, and consequently intended, on the next convenient occasion, to take the place by storm. Feeling perfectly secure of my conquest, I led her, on the way home from our ramble, through the street on which the shop fronted where the young blacksmith wrought at his trade. I did it in order to give him the opportunity of witnessing my triumph; and in the red light of the forge that was blazing within, I pointed at the swarthy and dust-begrimmed figure of my rival.

"That is a handsome figure for a woman to fall in love with," said I triumphantly. She turned upon me sharply in reply:

"He is a noble fellow, notwithstanding, and supports a poor old mother with the labor of his hands. He is sober, honest and industrious, and is sure to become a rising man in our village; well educated and intelligent, he has been elevated already, only six months out of his apprenticeship, to the position of foreman of the shop, with the promise of a junior partnership next year. It would be an improvement on their present condition, if a few of the *smart* young men about town, who live on their parents, and do nothing themselves, were even half as respectable."

"I was not exactly sure that the remark was not aimed at me, and hesitated to reply; when just at that moment a din was heard coming down the street — a strange hallowing sound, mingled with the cry of human voices. Turning around in some haste, to ascertain the cause, I saw with a good deal of — I will not say terror — an infuriated animal rushing directly towards us, followed by the butcher and his boy, from whom he had escaped, and who were shouting at the top of their voices, for all pedestrians to clear the way. I declare to you, gentlemen, upon my honor, there was no intention on my part of deserting my companion in such a time of peril. *I just left her side a moment, and jumped over the fence, to look up a place of safety for her*, as the raving beast came down the side-walk like an avalanche. At this moment the young blacksmith rushed out of the shop, and ——"

"Took the bull by the horns!" chimed in the Sophomore.

"No, Sir!" responded the Senior, indignantly, "took the girl around the waist with his huge dirty arms, and set her in a second inside the shop door, while he stood guard at it, sledge in hand, until the animal and his pursuers went by like a whirlwind, turning neither to the right nor to the left.

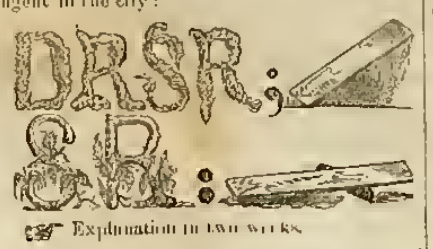
"The blacksmith triumphed, gentlemen," the narrator concluded in a melancholy voice: "she gave me a summary dismissal, and smiled on the blacksmith from that day. He married her within six months, and I, in despair, came here to College, being now one of the most solitary and unhappy of the 'Lone Men.'"

The double city of Niachta and Mauisachen, on the borders of the Chinese and Russian dominions, is separated by a line of palings. On one side is a prim little Russian town, and crossing a little neutral ground, you enter a gateway, in a lofty wall, which completely hides the Celestial City.

Youth's Corner.

ILLUSTRATED REBUS, NO. 23.

The following symbolical correspondence passed between a gentleman and his business agent in the city:



☞ Explanation in two weeks.

[Written for Moore's Rural New-Yorker.]

GEOGRAPHICAL ENIGMA.

I am composed of 31 letters.

My 10, 24, 17, 2, 12, 3 is a county in Virginia.
My 8, 11, 21, 6, 23, 29, 5 is one of the U. S.
My 4, 10, 24, 30, 3, 17 is a town in Russia.
My 8, 28, 25, 11, 9, 1, 15 is a gulf in Europe.
My 26, 27, 17, 16, 18, 31, 10, 22 is a capital in Europe.
My 19, 6, 7, 4, 17, 20 is a city in Bohemia.
My 29, 20, 6, 21 20 is a town in Africa.
My 21, 27, 9, 14, 4, 20 is a river in Africa.

My whole are two great curiosities in close proximity, one natural, and the other artificial.

Wilson, Niag. Co., N. Y. E. O. F.

☞ Answer next week.

[For Moore's Rural New-Yorker.]

Question for the Boys.—How large a tract of land would it take, in a square form, fenced with a brick wall, 1,000 bricks to a rod, that there shall be as many acres in the field as bricks in the wall?

☞ Answer next week.

Conundrum.—What two places' names in France will describe the language of a parent who refuses to give his daughter in marriage?

☞ Answer next week.

Answer to Illustrated Rebus No. 21.—*Washington—first in War, first in Peace, first in the Hearts of his Countrymen.*

Answer to Acrostic Geographical Enigma in No. 21.—*John Caldwell Calhoun.*

Answer to Problem in No. 21.—*Constable's speed at first 8¼ miles per hour. Thief's speed throughout 9¾ miles per hour. Required distance 71½ miles.*

Wit and Humor.

THE BACHELOR.

A Bachelor sat by his blazing grate
And he fell into a snooze;
And he dreamed that o'er his wrinkled pate
Had been thrown the nuptial noose.

And a rosy boy came to his side
And bounded on his knee,
And back from his beaming face he shook
Fair curls in childish glee.

Then clear rang out his merry voice,
He shouted loud, "Papa,
I don't love any body else
But you and dear Mama!"

Oh! the father's heart o'erran with joy,
So long by love unlit,
And from its unseen depths he poured out
Affection infinite.

Outstretching arms of strength unborn,
He hugged—*the old house-cat*,
Which as 'twas wont, when master slept,
Had leaped upon his lap.

Smart.—"Why, Mr. B.," said a tall youth to a little person in company with half a dozen huge men, "I protest you are so small I did not see you before." "Very likely," replied the little gentleman, "I am like a sixpence among six copper pennies, not readily perceived, but worth the whole of them."

Some Credit to the Czar.—The Czar may boast of the 3,000,000 soldiers at his command but, although surrounded with so many forces, nevertheless, considering the shifts by which he has been obliged to raise money, it must be confessed that he is a *lonely* man.—*Punch.*

A friend having one of Colt's large sized revolvers in his hand, was asked, "Is that a *horse* pistol?" "No," was his reply, it's a *Colt's*.

A man saved from drowning a night or two since, in Boston, abused the man who rescued him, because he did not save his hat.

A tailor, who in skating fell through the ice, declared that he would never again leave a hot goose for a cold duck.

GREAT PUBLIC SALE OF BLOODED STOCK.

The subscriber, having spent the most of the past winter and spring in Kentucky, has selected from the choicest herds of blooded cattle, upon the different plantations in that country, upwards of one hundred head of the best specimens of the Durham blood, a part of which are from the old Ashland Estate of the Hon. Henry Clay.

He has also selected about one hundred fat cattle, eighty-five of which are *spayed heifers*; also about five hundred sheep, most of which are coarse wooled, about one hundred ewes and lambs, the balance are fat wethers, weighing from one to two hundred pounds each; also a few pairs working oxen and mules. The above stock will be imported into this country in May, and will be sold at public auction, on the farm of Durham Park, two miles east of Lima village, Livingston county, N. Y., on *Friday June 2, 1854*.

The sale will commence at 10 o'clock, A. M., and continue until through. Carriages will run to the place of sale, from the cars at West Bloomfield and Honeoye Falls, on the Niagara Falls Railroad.

The subscriber is confident that this stock is *fully equal*, if not superior, to any former importation into Western New York. He is also of the opinion, that, with the rapidity of climate, and the abundant resources and facilities at this great country for the improvement of stock, we are no longer under the necessity of subjecting ourselves to the enormous expense and hardships of recruiting, as the "Bluffy Fraternity" of England call for, after having received from our old "Mation," her best blooded stock and most scientific grazers, we can soon teach her what she already fears, that her "feminine majesty" will soon be obliged to exchange her treasures, for a selection from our own stock, paying equally as liberal for the privilege as we have formerly done.

A liberal credit will be given at the above sale, hoping that all will avail themselves of this opportunity to improve the stock in this country. JULIUS H. TAYLOR.

May, 1854. [227-31] East Bloomfield, N. Y.

THE PEOPLES PATENT OFFICE.

This well known establishment is still carried on under the personal supervision of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with Inventors from 9 A. M. to 6 P. M. All consultations and business strictly private and confidential.

Models from a little knee may be sent by express or otherwise. For further information apply in or address, postpaid, ALFRED E. BEACH,

Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Address as above.

IMPORTED HORSE "CONSTERNATION."

This well known thorough-bred horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of Youatt.

Terms—$10 the season, $15 to insure, *payable in advance in all cases*. Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No more will be served than is either ring-boned, spavined, or blind. J. B. BURNET,

Syracuse, N. Y., May 1, 1854. 228-81w-3m

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

Emery's Horse Powers, Threshing Machines and Separators, Circular and Pursuit Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use—Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—Grain, Field and Garden Seeds, of the best Imported and Shaker growth.

E. H. HALLOCK,

Warehouse and Sale Room No. 21 Exchange Street, Rochester, N. Y. 226-tf

EDWARD HARRISON'S PATENT GRIST MILL

Received the highest premium at the World's Fair; and more than 200 of them have been sold within two years. The stones are French Burr; the frames and hoppers, cast iron; and the spindles, cast steel. They will work fast for bolting and on all kinds of grain, and will keep in repair longer than any other mill. Having just completed my new buildings, for manufacturing and running them, I am now prepared to supply all orders for all the sizes, from 20 inches to four feet diameter, including a superior farm and plantation mill, which will grind corn in the best manner, by horse-power, or even by hand. Public attention is invited to this small mill in particular. Descriptive circulars, with cuts, sent to post-paid applications.

225-tf EDWARD HARRISON, New Haven, Ct.,
Sole manufacturer, and Proprietor of the Patent.

PREMIUM FOWLS.

I have for the last few years received the First Premium on my Brahmas and other varieties at the N. Y. State Fairs—also Monroe Co. Fair at Rochester. I now have 23 varieties for sale—and eggs for hatching. My fowls are second to none in America. All warranted to be pure in every particular, and what they are sold for.

Rochester, N. Y. 224-6t* D. P. NEWELL.

LAND PLASTER

At Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

217-3m. JIREH BOWLEY.

BONE DUST.—We can supply a few barrels of genuine coarse bone dust, at $2,50 per barrel.

247 H. C. WHITE & CO., Buffalo Ag'l Warehouse.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance*. The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar Journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

The Wool Grower and Stock Register is the only American journal devoted to the Wool and Stock Growing Interests. "It contains a vast amount of *useful* and *reliable* information not given in any other work, and should be in the hands of *Every Owner of Domestic Animals*, whether located East or West, North or South.—Published monthly in octavo form, illustrated, at Only Fifty Cents a Year—5 copies for $2; 8 for $3. Vol. 5 commenced July, 1853. Subscriptions can begin with the July or January number. Back volumes furnished.

Address D. D. T. MOORE, Rochester, N. Y.

VOLUME V. NO. 22.} ROCHESTER, N. Y.—SATURDAY, JUNE 3, 1854. {WHOLE NO. 230.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper,

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:
J. H. Bixby,—H. C. White,—T. E. Westmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete Agricultural, Literary and Family Newspaper.

Rural New-Yorker.

Progress and Improvement.

SPECIAL MANURE THEORY.—NO. III.

Some of our readers will be inclined to ask how we account for the facts adduced in the previous article. At present they are inexplicable. Laws there are, doubtless, which regulate these as well as all other phenomena, but we are not obliged to understand them clearly before we yield assent to the truth of careful observations. We know that wheat destroys a large quantity of ammonia during its growth, but we do not know why, how, or for what purpose the destruction takes place. So, too, it is unmistakably a fact that turnips, though they contain much less phosphoric acid than wheat, require for their growth more available phosphoric acid in the soil, than the wheat plant. But we do not pretend to see why this should be so. It is well to know that such is the case, even though we do not understand the cause.

But, it will be said, these facts appear to indicate that the *less* quantity of any particular substance a plant contains, the *greater* should be the quantity supplied in the manure; and that such a supposition appears ridiculous.—We do not wish to establish any such a rule. Our object is not to propound a new theory, but to show that the theory on which so many now act, or rather *argue*, for few *act* upon it, is unsound. We would respectfully ask the advocates of the special manure theory on what ground they *assume* that, because certain elements preponderate in the plant, they should preponderate in the soil, or manure best adapted for their growth. Such a view, we are free to admit, is exceedingly plausible; but is it not superficial? A few considerations, we think, will show it to be so.

The most profound physiologists cannot tell us how plants take up their food. They offer a number of theories, which are at variance with each other. Some think that the matter is absorbed by spongeoles at the extremities of the roots, while others say that the whole epidermis of the root takes up the food by endosmose. The latter opinion is sustained by many careful experiments, but the former is most popular. Those who have examined into this subject, will admit that we are yet lamentably ignorant of the laws which govern the absorption of food by plants. Should we not, therefore, be more careful in writing out prescriptions for compounding a manure best suited for the growth of this or that particular crop, simply from the deductions of analysis?

One point seems clearly established—*plants can take up their food only in solution.* Rain falls on the soil and dissolves by the aid of its carbonic and nitric acid, &c., the soluble matter of the soil, conveying it to the roots of plants. May we call this dissolved matter from which all plants are sustained, *the sap of the soil?* How then do plants obtain just such food as they require from this common source? If one plant required potash, another soda, another lime, another phosphoric acid, &c., it would be difficult to suggest any plausible hypothesis; but this is not the case. Agricultural plants are all composed of similar constituents, the only difference being in the relative proportion of the ingredients. Take, for instance, the turnip and the wheat plant; the latter contains much more phosphoric acid and less potash than the former. If we plant them both in the same soil, how does the turnip absorb, from the same common *sap of the soil*, less phosphoric acid and more potash than its neighbor, the wheat plant? Plants in popular treatises are frequently said to have the power of *selection*. But they are not sentient beings, and have not the power of volition, and this power of selection in regard to obtaining more or less of substances they require, which to a certain extent, they undoubtedly possess, must be attributed to catalysis, or to the peculiar formation of the spongeoles or pores of the roots. Suppose we take the latter view, which is most consistent with observed facts. If the *sap of the soil* contains sufficient phosphoric acid for the wheat plant, it obviously contains *too much* for the turnip plant growing by its side. How, then, shall the turnip absorb a sap containing less phosphoric acid than the wheat plant? Is it not probable that the pores or spongeoles are so formed as to separate or filter out a portion of the phosphoric acid, or some of its various compounds. In other words, is it not probable that the wheat plant, requiring a large proportion of phosphoric acid, would have pores or spongeoles so formed as to be capable of taking it up from a very weak solution, or from a *sap of the soil*, in which it existed in the minutest quantity; while the turnip plant, which requires but a small quantity, would have pores or spongeoles so formed as to take up only a small portion of that which was capable of assimilation?

Plants have definite characteristics, and if their power of obtaining dissimilar food from a common solution, is owing to the formation of the pores of the roots or spongeoles, as we have assumed, then, a plant which requires a large proportion of any particular substance, would have pores so formed as to take it up in large quantities, while a plant that only required a small proportion would have pores so formed as to *prevent* too large a proportion from entering the circulation of the plant. Under these circumstances, then, if we wish to increase the normal growth of a plant, we must supply it, in large quantity, with those substances the pores require in the most concentrated solution, to wit, those of which they contain the least.

It must be understood that these are mere speculations, which we offer, not to confirm the facts which gave rise to them in our mind, but simply to show that those who make such an easy matter of determining from analysis, the substances best suited to the increased growth of any particular crop, take but a partial view of the subject. The *facts*, founded on Mr. Lawes' experiments, and on the practice of thousands of the best British farmers, need no theoretical confirmation; and whatever may be said of the speculations we have ventured to build upon them, the facts will still remain in all their force, and they are standing witnesses against the doctrine of special manure as popularly understood.

CULTIVATION OF ONIONS.

R. B. E. wishes for information in the cultivation of onions, soil, seed, manure, &c., best adapted for their proper development. With but little experience in their cultivation, the writer of this condenses an article from various reliable sources, for the benefit of R. B. E., and others.

Other things being equal—a light, loamy soil, approaching somewhat to sand, is the best soil. The onion delights in a dry warm soil, one that shall receive and impart a goodly degree of heat without parching. At all events the soil should be a *good* one, and in good *condition*, made rich with the proper food for the plant.

For the successful cultivation of the onion, on soil which has never produced onions, there should be a preparatory course, by very deep plowing for one or two years, and the ground thoroughly cultivated with corn, carrots, or something of the sort, that shall perfectly subdue and mellow the ground, whilst, in the mean time shall be given generous dressings of good manure. After these crops, give the land another dressing of strong manure, with the addition of muck-bed if convenient, covering it well, but not deeply—then harrow thoroughly and clear the surface of roots, weeds, and all obstructions. If a coating of well-rotted manure be then added to the surface and incorporated with a hush harrow, all the better; and your ground will be in fine condition for receiving the seed just as early as it can be planted in the spring. After this, the onion crop may follow year after year, for an indefinite period—as most people think the produce is bettered by continued cropping. There are instances where the crop has been known to follow for ten, fifteen, and even thirty years, without any apparent deterioration of the product. And we are told a spot of ground was shown in Scotland, a few years since, which had been cultivated in onions for *eighty* years, and the last crop was as good as any of its predecessors that could be remembered. But fertilizers of course must be added, to keep up this good faith—they are indispensable to a profitable crop. The manure is added before the plowings, in a finely rotted condition.

After the ground is commenced to be cropped with onions, the plowings are more shallow—say four or six inches. The land is also well harrowed, to obtain a fine and mellow surface, for on this also much depends. Some cultivators give an occasional deep plowing; others think it unnecessary, while some do not even plow the land, only occasionally after it is once well brought to. Great care must be exercised too, to keep down the weeds—permitting none to go to seed, and then to apply manure free from foul stuff. When the land is once cleared from weeds—the cultivation is light and easy, and mostly done with an onion hoe, propelled on wheels, which saves much back-aching labor.

Ashes, soot, charcoal, and plaster, are all beneficial to the onion. Some prefer leached ashes to unleached. Any strong manure, that is well rotted, is applied very advantageously. Muck-bed, by the onion raisers of Mass., is considered almost indispensable. Whatever the manure applied, it should be near the surface and well incorporated with the soil. It is in vain to expect full crops of the onion without full and generous manuring, and the cultivator must be willing to work early and late, without stint of elbow grease, or fear of soiling the knees of his trowsers or the palms of his hands.

Much care should be had in the selection of seed. Formerly the eastern cultivators preferred the *flat* onion. But now, the round, thick, and plump onion is more sought after and commands ten per cent. better prices, being thought to yield better and to weigh heavier. This change in shape, was brought about by carefully selecting those of the best approved form for seed, and using caution in preventing them from mixing with baser sorts in the blossom. The silver skin, red, and white onions are most raised. The white is milder, and preferred for immediate use—does not keep as well. The red sells better in some markets, but does not produce as heavy crops. The silver skin is most cultivated. The drill barrow is used where a quantity of seed is to be sown. The quantity of seed per acre is about three pounds. The best cultivators prefer a pretty thick seeding, so as to secure a full crop, without gaps in the rows, and also to prevent too great a growth, as they find that those from one to two inches in diameter are most sought after in the markets.

A good deal of care is necessary while the plants are young, and they should be handled with much caution—any derangement of the roots and fibres of the young plant, is followed by prejudicial results. Weeds should not be allowed the least ascendancy, and it is here that the greatest item is had in the resultant profits, by having the ground clear of the pests.—They do not overshadow the young plants, or suck away the nutriment, while the young onion is not injured by any disarrangement of its tender roots, by a severe weeding. The plant on clean ground, is therefore permitted to grow forward without any let or hindrance to its highest development.

There is probably no plant more liable to injury from weeds than the onion. The fibres it sends out, are numerous, minute and tender, and any injury to them must result in drawbacks on the profits of the crop. If the land is properly clear of weeds, or their seeds—two weedings are all that are needed. All the rest of the stirring can be done with an onion hoe. Keeping the ground well stirred, loose and clean, facilitates the bottoming of the onion, so that the old maxim of "a stitch in time," &c., applies with much force to the raising of onions.

The *cut worm* is a lover of young onions, and is not slow in *cutting* them down. The only remedy that can be suggested against them, is to "catch them, and pull out their teeth." To do this, one must be up betimes in the morning to catch them at their work, for they are soon after light burrowed again in the ground. When the tops begin to wither and die, it is usual then to commence the harvesting. Eight or ten rows are pulled and thrown in one, where they lie for a week or so, when they are stirred and turned with a rake, when if the ground be dry and the weather good, in about a week more they will be in order to cart to the barn, where they are sorted and cleaned of refuse leaves, when they are ready to be barreled, or bunched for market. A good deal of the labor of cultivating and fitting the onion for market, can be performed by children who are more nimble and come more readily to the work. The yield per acre, on good soil, with such treatment as is indicated above, will go above five hundred bushels to the acre, as an average. The potato onion, especially the English potato onion, is coming more into cultivation and is promising to be profitable, and the more so, as they are removed so early that a second crop of turnip or the like, may be raised on the same ground. These are propagated not by seeds, but by offsets, and hence, are more easily worked amongst in the early stages of their growth. Some think them not so good keepers. T. E. W.

CULTURE OF INDIAN CORN,

TO OBTAIN THE LARGEST YIELD.

A correspondent of the N. Y. Tribune asks how to grow one hundred bushels of corn to the acre. With some excellent advice and directions in the premises, the Tribune also advises deep plowing between the young growing corn. Methinks that all the deep tillage corn requires, should be done before plowing, and that no other cultivation is necessary afterwards that cannot be done by the hoe, or a steel-toothed cultivator. Turning up the soil with a plow so soon after it is planted, exposes it to lose its ammonia in the rays of the new hot sun, and drying winds. In loosening the surface with hoe or cultivator, the weeds are killed,—the stirred surface takes in the night dew by capillary attraction, and the roots of the corn strike wide and deep through the previously well pulverized soil, availing themselves of the ammonia as it is generated by the humus in the soil.

The Tribune says, that corn ground should be plowed two feet deep, with Mapes' subsoil plow. Methinks this is going a little too deep for present farm economy, it being about four times as deep as ordinary plowing, an innovation too great to be immediately adopted by that constitutionally conservative man, the farmer. If two inches of urine saturated, unwashed, stable manure is placed in the bottom of the furrow or trench, ten to twelve inches below the surface, in an undrained calcareous clay loam, not previously exhausted of humus, it may be made to produce at least one hundred bushels of shelled corn to the acre. Plant early in drills, 2½ to 3 feet apart, according to the larger or smaller variety of the corn; thin out the plants at the first hoeing, to about 8 inches in the row, and cut out barren or fungus stalks and suckers afterwards; the product is worth the trouble for soiling cows. Hoe or cultivate, or both, as soon as the plants are up; this gives them a better start than soaking the seeds, and often counteracts a light frost.—With the thermometer much below 70°, corn is stationary above the surface, but the roots continue to grow; in proof of it, such corn will gain more in stalk in one hot day, than later planted corn will in two days.

There is no greater mistake than to suppose that cold weather stints the early planted corn. I have had it turn yellow and remain stationary for a week or more; yet this corn ripened two weeks earlier than that planted later. In cool, damp weather, corn is gaining that strength of root which alone enables it to support the subsequent heat and drouth of summer. The advantage of having unfermented manure deep in the soil, is that the corn roots may find that ammonia and water, which is generated or chemically formed, only after summer heat is in full force. It is also a mistake to suppose that a July and August drouth, in our climate, diminishes the cereal product of a previously well managed corn field; however fatal it may be to the late planted, undrained, ill-plowed, manureless field. I have had roasting ears of sweet corn in forty days after planting, but they were the longest, hottest days; after the long cool nights of September, corn grows and matures slowly; in October it will hardly glaze, hence that farmer who complains of having much soft corn, sets the seal to his own neglect and want of skill in his great calling. S. W.

BUCKWHEAT.

This crop, though last to be sown, is not by any means the last in importance. As it can be got in at a time of comparative leisure, (from the 10th to the 20th of June), and as it will grow on almost any soil, even if indifferently prepared, it is, all things considered, many times, one of the most profitable crops. And who that has tasted of "hot buck-wheat cakes on a cold frosty morning," will deny that they are among the luxuries of the table? If the grain is of fair quality, there is no good reason why the meal should not be as white as the flour of wheat; if it is not, the fault is in the grinding.

As feed for horses, when ground, it is excellent, and for cows that give milk in the winter, there is nothing superior. Were its merits for this use better known, they would be more fully appreciated.

Dairymen, try it. When mixed with other grain, it is also good for fattening hogs. Concerning its value as a green crop, to be plowed under, there is a difference of opinion. Chemists tell us that it does not contain the elements of fertility in as great abundance as clover, and according to their theory, it is not as valuable as a green crop.

But the writer has tried it on a tough sward, with eminent success,—the benefits, no doubt, partly arising from its mechanical action in pulverizing the sward, and for this it stands pre-eminent; it is superior even to peas. C.

Remarks.—It may possibly be superior to peas for mechanical action in tenacious soils, but that it is superior to peas for fertilizing purposes, is, to say the least, contrary to many well attested experiments, and contrary to general opinion, among experienced men. Will our esteemed correspondent give us his experiments more in detail?—Eds.

Corrosive Sublimate for Sacks.—It is well known that nearly all substances are more or less affected with mildew, which greatly accelerates their decay. Corrosive sublimate (*chloride of mercury*) affords the best means of destroying it, though there are other substances less expensive, which in other cases answer the purpose equally well. How frequently have we heard farmers complain, that their grain sacks prematurely lost their strength from partial decay. We are satisfied that much of this rotting of sacks, cordage, &c., is attributable to a species of fungus, or mildew, which may be destroyed, or what is still better, be prevented, by soaking the sacks in a weak, solution of corrosive sublimate, say one drachm to each quart of boiling water. If you purchase any new sacks this season, try it on a few and report the result.

Chandlee's & Kemp's water drills, for the distribution of guano, superphosphate, and other concentrated fertilizers, are spoken of very highly by the British Agricultural press. Their use insures a crop of turnips, and the action of the manure is more immediate and beneficial.

Communications.

[For the Rural New-Yorker.]

COUNCIL BLUFFS.

Friend Moore:—In the Rural of April 15th, a subscriber from Keuka, N. Y., asks some one to give him a topographical sketch, &c., of Council Bluffs, Iowa. Having resided there in '51 and '52, and spent a great portion of my time visiting the country round, I think I am prepared to speak of it as it *was*; and, as I have regular, faithful correspondents in that section, I think I am also prepared to speak of it as it *is*.

Council Bluffs proper, includes the whole strip of country bordering on the Missouri River from the mouth of the Boyer to the point opposite the mouth of the Platte or Nebraska River; which strip is some 35 miles in length, and called Council Bluffs, because Lewis and Clarke, when ascending the Missouri, held *councils* with the red warriors, among the *Bluffs*. The village of Council Bluffs, in '51, was situated in an elbow of the Missouri, and numbered perhaps a dozen log huts, covered with shakes and bark; but the high water of the spring of '52, registered it with the names of those that *have been*. This was the old U. S. Council Bloffs' Payment Station.

When the Mormons were driven from Missouri, they wintered some eighteen miles north of the village of Council Bluffs, and finding their means, in the spring, rather scanty, some were obliged to remain.—They commenced a village named Kanesville, which has since been the starting point for them to Salt Lake. When the village of Council Bluffs, in '52, was washed into the River, and the Post Office removed, then Kanesville assumed the name of Council Bluffs City.

Council Bluffs City, at present, contains some 1500 inhabitants, (mostly Mormons,) and when emigrants are outfitting, it is truly a business place, but at other times rather dull. Steamers visit the Bluffs once a week, and sometimes oftener, but the Missouri River has no good landing places, consequently there can be no great city in the State of Iowa. I give this history to remove the fog that has so long hung over this Hesperian spot. Now, to answer the inquiries of my Keuka friend:—Like all Western Rivers, the Missouri has its Bottoms, which are from one to eight miles wide, with a deep, rich soil generally, but rather low, and subject to overflows. Next to the Bottoms come the Bluffs, which are very broken, bold and picturesque, with here and there a few barren oaks, which form a noble retreat for Deer and Turkey, the hunting of which furnishes pastime for the young nimrods of the West.

When the Bluffs are ascended then we come to a high, rolling prairie country. In this section, as in most of the West, timber is rather scarce. There is a strip of Cotton-wood lying upon the River, varying from one-half to three miles in width, also Black Walnut, Elm, Soft Maple, Hackberry, Oak, etc., lying upon Key Creek, Silver Creek, Nishnahotana, and Boyer Rivers. These streams afford great facilities for water power.

This section was being surveyed in '52, and in '53 a Land Office was to be established, and it is probable that the *best* selections are made. The soil of the Bottoms is composed of quick sand and decayed vegetation, and of a very dark color, and in places very unequally mixed. The soil of the Bluffs and Prairies is of a yellowish clayey loam, and the whole capable of growing anything which is now grown in the temperate zone, but perhaps better adapted to corn than winter wheat, as the winters are dry and almost snowless.

Fearing that I am spinning too long a yarn, I will close by saying to Keuka, that if he wishes more, please address me personally, and he shall be accommodated gratis.

Springwater, N. Y. D. B. WAITE.

QUACK GRASS.

Eds. Rural:—In the Rural of the 20th inst. I noticed a communication from John Johnston, of Geneva, relating to this very common pest to our fields. In that communication the question is asked, "Did a farmer in the State of New York ever see quack grass on land that was dry?" I answer that if the querist will take the trouble to visit our "sandy gardens," he can see abundance of quack grass on lands which are drier than any wet lands can be made by the most thorough system of drainage. No longer ago than to-day, I was walking over a piece of sandy land, so light that the surface is easily blown about by the winds, after being plowed, and I noticed very luxuriant specimens of *quack grass*. I measured some of the blades of this grass, and found them to be several of them full one-half an inch in width. The roots, too, were very large, and every part of the plants indicated a flourishing condition of the weed—if weed it may be called—and this, too, on land which can never be wet, for it is as dry and loose almost as a mass of sand.

Draining land covered with quack is only beneficial by enabling the tiller of the soil to reduce the earth to a finer tilth than possible when wet; but draining alone will never eradicate quack grass. In fact, I have seen quack grass flourish better along covered drains than elsewhere,—for the reason that the newly disturbed soil over the drain allowed the roots of the grass a better and easier means of spreading than did the harder soil around. So an annual plowing refreshes this grass, and adds new vigor to its growth.

The course pursued in eradicating the quack grass in the field, spoken of by Mr. Johnston, was an excellent one, however, in this respect. The early plowing, and the subsequent thorough tillage through the summer and fall, prevented the grass from increasing by constantly *transplanting it*, so to speak, while the lungs of the plant were destroyed, and the plant kept for a whole season without any chance to grow. Such treatment will kill quack grass, or any other plant, and it is the only way to destroy it; but even then, if there are trees, stumps or rocks on the land, there will enough remain to stock the land with again. I am satisfied, from actual experiment, that thorough tillage without cropping for one season, is all that is necessary to exterminate the grass. But as long as there are fences, or other obstacles to this treatment of the whole soil on a farm, no person can ever *eradicate* the weed entirely.—We have had a great deal of trouble with the quack grass, and know from trial that underdraining will not destroy quack grass.

C. H. Strowger.

Penfield, May 22, 1854.

ROADS, BROAD WHEELS, &C.

Progress is advancement in knowledge of the application of natural principles, in pursuit of results; if true principles are adopted and pursued, right results are sure to follow. The present condition of public roads proves a fault in some cause, and a moment's consideration of the true reason of this condition, ought to determine the true course to pursue for improvement.

The true philosophy of easy motion is, freedom from obstruction; and that of rest, in effectually resisting impulse, force. The first is demonstrated in rail and plank roads, and the last in common earth roads. The rail is the true principle, but too costly for common use. Planks have proved a disappointment to stockholders and community, and the nature of materials most convenient for making and repairing highways, forbids all rational hopes of maintaining a smooth, hard surface necessary for ease or comfort, of business or pleasure.

If circumstances make it inconvenient to pursue correct principles, common sense would seem to advise the adoption of that course which makes the nearest approach in results. Thus, if convenient materials are not suitable for good roads, with the present fashioned wheels, then suit the form of the wheel to the quality of the road materials, and make wagon wheels designed for heavy teaming with wide tire and broad face to run on the surface, operating to smooth, level and harden the road, instead of the present narrow, contracted mode, better calculated for mortar and brick making, or subsoiling, than for either pleasure or profit.

Good reasons are apparent why the broad-tires to lumber wagons and cart wheels should be adopted, and the custom enforced by law, if reason proves inefficient. They will run more on the surface, meet with less obstruction, are easier for the teams, improve rather than impair roads and pavements, and are better for the farmer, for hauling in his crops, and drawing out manure over meadows and grain fields. Custom, that clog to advancement, drag-chain of improvement and incubus of progress—alone defends the present narrow tires. Wagons and carts designed for moving heavy loads, are necessarily lumbering affairs, not suitable for fast motion; while traveling and pleasure carriages effect but trifling injury to roads,—and thus far, fashion and utility need not interfere.

A premium might be deemed the best law, if any was found needful, to enforce the broad wheel, and yet prove highly advantageous to the tax-payers in the end. S. Graves.

Marcellus, April 24th, 1854.

Profitable Hens.—Having noticed in your paper of last week, the article headed, "Profitable Hens," and also the inquiry, "Who can beat this?" I give you the following:

I have twenty-four pullets, from which I sold from Feb. 14th, to May 10th, fifty-three doz. eggs, also set nine of them with fifteen eggs each, within that time, besides those used by the family, of which I have kept no account.—The breed is natives crossed with Shanghais.—Their feed, corn meal, ground in the cob, two quarts per day. They have no underground room, but roost in the barns. M. Ford.

Middleville, N. Y., May 25th, 1854.

Millet is a crop which should attract more attention than heretofore, particularly as supplying subsistence for animals at a season when, in dry summers, the ordinary crops have partially failed.

Agricultural Miscellany.

THE WEATHER AND THE CROPS.

For the past few weeks the weather has been most delightful, and the operations of the farm and garden have been performed with unusual celerity. We were on the farm of one of our best farmers, the other day, when he observed that though the spring had been cold, wet and backward, yet, owing to the late fine weather, he never was so forward with his work. Crops of grass and clover, so far as our observation extends, are very luxuriant.—Though the cool has much affected the peach trees, yet there is promise of an abundant crop, and the same may be said of most other fruit. Barley, generally, looks poor, though we have seen some, sown early on dry soil, which promises an abundant yield. Oats seldom looked better. But what shall be said of the wheat crop? Much anxiety is felt in Europe about the prospects of the next wheat harvest on this continent. It is to American farmers Europeans look for supplies of breadstuffs, while they "like fiends each other tear, in all the hellish rage of war." We have nothing very definite to offer on the point. The late, wet spring materially injured much of the wheat on low lands; but from all we have seen and heard, the past few weeks have vastly improved even the worst crops. One farmer pointed out to us a field of wheat which was so much injured that he intended to have plowed it under and planted to corn, but which now bids fair for a good average crop. On the whole, we believe the wheat crop of Western New York—what our British friends call the great "State of Genesee," promises to be better than an average.

We clip the following from our exchanges:

In a hasty ride, last week, through the north and east parts of the county, we noticed that the wheat crop, very generally, looked fine, giving promise of a bountiful return. The weather during the winter and early spring was very unfavorable, but for the last five or six weeks it has been exceedingly favorable to wheat.—The spring has been backward and farmers are behind in their spring work, but little plowing for spring crops having been done until within the last two weeks.—*Livingston Republican, May 18th.*

Notwithstanding the backwardness of the season, we learn that the wheat crop is in greater forwardness in the State than has been before known. We are advised that in many of the counties south, and in the interior, a considerable quantity of wheat will be cut as early as *the tenth of June.—Chicago Journal.*

The wheat crop in this section of the country, looks fine, and bids fair to produce an abundant yield. In riding through New Castle county, on Saturday last, we saw that the prospect of a good harvest in that county was also very flattering.—*Smyrna (Del.) Herald.*

The wheat in this region, the farmers tell us, looks well, and promises a rich harvest.—*Geneva Courier, May 24th.*

We never saw the wheat, grass, and oats, look more promising in any former year, than they do at the present time.—*Germantown (Pa.) Telegraph.*

New York Farmers' Club.—At a recent meeting of the New York Farmers' Club, Solon Robinson, (Hot Corn,) of the New York *Tribune*, remarked that "the number of members attending to-day, is less than usual, but if our doctrines be good the world will hear of it. Dr. Beecher's sermons are not to his congregation alone, but to the readers of an hundred thousand *Tribunes* or other papers."

Yes, my dear sir, and if your doctrines be *not good*, the world hears of it just the same through a hundred thousand *Tribunes*, and other papers. Were it not so, little would be heard from the New York Farmers' Club.—We had the honor of attending one a short time since, and must say, that we never before heard so much nonsense uttered in so short a time.

Monroe County Agricultural Society.—A meeting of the Monroe County Agricultural Society will be held at the Court House, Rochester, on Wednesday, the 7th day of June, at 10 o' clock A. M., for the purpose of adopting the Premium List, making regulations for the Spring Plowing Match, appointing Judges, etc. etc. A full attendance of members is requested.

WOLF ON THE JAW.

I wish to inquire of you or some of your subscribers, if there is any remedy for a wolf upon an ox's jaw? If there is, any information will be gratefully received, as I have a three year old steer that has one. It has just made its appearance. H. D. Rixo.

A "wolf," as it is called, is a disease of the bone of the jaw. It is called, in surgical language, "*Necrosis.*" Sometimes it originates in an ulcerated tooth, and if the tooth be extracted it has been known to arrest the progress of the disease, but not always. It is possible that an operation like that usually performed in cases of *necrosis*, that is, cutting out the diseased portion of the bone, would effect a cure, but perhaps it would be most economical to fatten the animal as soon as possible and beef him.—*Maine Farmer.*

PINE-APPLE CHEESE.

What is called *pine apple* cheese, was first made in this country by Mr. Lewis M. Norton, of Goshen, Ct., he having commenced its manufacture in 1808. That which had been previously known here, was imported. Mr. N., without any particular knowledge of the mode by which the article received its peculiar form, imitated it so successfully that his process has been extensively adopted in many parts of the United States. Several years since, while collecting information in regard to the cheese-dairies of Connecticut, we called on Mr. Norton, and obtained from him many valuable facts.—He was at this time using the curd produced by the milk of ninety cows, a considerable portion of which was purchased in a fresh state from his neighbors. His process was, in substance, as follows:

The curd is kept for twenty-four hours before it is made into cheese. The advantage of this is supposed to be that a degree of fermentation takes place, which, being checked at a particular time by the cutting of the curd, preparatory to its being formed into cheese, it is not renewed after it comes from the press; thus preventing the defect of the cheese being hoven or blown.

The curd is cut with a machine into pieces of not more than a fourth of an inch square.—After being cut, the curd is put in a cheese cloth, placed in warm water, and the temperature gradually raised by pouring in water that is still warmer, till it reaches 105 degrees, by the thermometer. This does not *scald* the curd, which according to the practice of the best cheese-makers in England and this country, is, we think, discountenanced. The curd is next cooled, by adding cold water to the temperature of 88 degrees, when the whole of the water is drawn from the vat, and the curd weighed, and salted with the finest kind of table salt—four ounces of salt to ten pounds of curd—and after being well stirred is put in the press, where it remains twenty-four hours, or a longer time, as is convenient, as it takes no hurt by remaining forty-eight hours. The curd is weighed immediately over the tub, being drawn up by a pulley, and when this is done, is again lowered into the tub, where it is salted.

The cheeses are pressed in moulds, made of sound blocks of oak timber, about twenty inches long and ten inches square. They are sawed lengthwise through the middle, and each half is carved or worked out so as to give the general shape of a pine-apple—one half in each part. From the cavity to the upper end of the block, a groove is cut in each part, which, when the parts are placed together, makes a round channel of about two and a half inches in diameter, for passing the curd into the mold. When the two parts of the block are put together in such a manner that the cavities match each other, and are strongly keyed into a frame, they form the mold for pressing the curd. The pressure is applied by means of a screw, operating on an upright, round piece of wood, which fits the channel to the block, and as it is forced down compresses the curd in the mold. The presses are very compact and strong,—appear to answer the purpose well. He has sixty-eight of them, and makes twenty-eight cheeses per day, weighing when dried five pounds each. When the cheeses are taken from the press, they are trimmed, and then placed in nets and hung in water of the temperature of 130 degrees. This is to soften the outside, that it may receive the desired impression from the net, which is done by taking them from the water while enveloped in the nets, placing them in a frame and straining the nets tightly over them by means of screws. This indents the threads of the net into the cheese in such a manner as to give them the external appearance of the fruit from which they are named. After this operation the cheeses are hung up in the nets from three to five weeks, for the outside to harden, and are then set on shelves having suitable hollows or concavities for the cheeses to rest on. In the centre of each concavity, a hole two inches in diameter is cut through the shelf, the more freely to admit air to the cheese, and to allow any liquid which may come from it to run off. The nets used for the cheeses are made of three-threaded flax-twine, and the manufacture of them costs, exclusive of the material, about 5 cents each. They will last three or four years.—*Boston Cultivator.*

Beef Cattle.—Our Western exchange papers echo the complaint we have here, at the Eastward, in reference to the growing scarcity of cattle. A St. Louis paper, now before us, states that dealers from New York are scouring Illinois and Indiana to buy up stock to meet the high prices current on the seaboard. High prices had been paid for good cattle—$7,50 to $8,50 per 100 lbs. net; $4 and $4,25 live weight, are the current rates at Chicago, and but few to be had at that. The prices paid at the Bull's Head, in this city, for the better qualities of beeves, on Monday last, were higher than ever known here before—equal to 13 cents per pound, at wholesale. This is about equal to 18 @ 20 cents per pound by retail.—*New York Express.*

Raise Parsnips.—The parsnip can be raised much more easily than the carrot, and is quite equal to it for feeding horses, cattle or swine. It has advantages over some other crops, by its hardiness to endure our most severe winters.—A deep, rich, and rather moist soil is preferable, but they succeed well in good dry soil.—We have grown them in marsh muck over 2 feet long and proportionately large. They may be sown *late* in the fall or *very* early in the spring. Never sow them when the soil is dry and hot; it is better to wait for rain.—*Michigan Farmer.*

Mr. Brown, a farmer of Conndivock, near Dalston, had a gosling with three feet, two in their usual situation and one upon its back, as perfectly formed as the other two. The little creature did not appear to be incommoded with the superfluous limb, as it was healthy and thriving, but having lived a fortnight, it sickened and died.

SECURING WILD BEES.

A swarm of bees was discovered last fall, by Mr. Edward Smith, in the woods of Mr. Alexander Gould, in the eastern part of Kennebunkport, in a large hollow hemlock tree.—On Thursday last, Mr. Smith, with help, proceeded to the capture of this buzzing family.—The hole by which the bees entered the tree was one or two feet from the ground. Having erected a staging, they first commenced cutting off the tree about eight feet from the ground, being as they supposed above the bees, but found when the shell had been cut through, that this was not high enough to be clear of them. They then stopped up the opening they had made, and cut the tree off still higher, being some nine feet from the ground, which was but just above the bees.—Then, they cut the tree off at the bottom, stopped up the ends, tipped the log over and hauled it home, where they set it up on end as before, and will endeavor to keep the bees in their present quarters. This tree was about two and a half feet in diameter at the top where cut off, and the hollow very large, and appeared to be actually filled with bees and honey. Two other hives were found and captured by the same man and his brother, near where this was taken, last fall, each of which contained about thirty pounds of honey.—*Me. Farmer.*

We have seen several swarms of bees secured in this manner at the West.

We once caught a stray swarm of bees that were flying through the air. Hearing their well-known noise at a distance, we instantly summoned out the whole household with tin pans, brass kettles, &c., and as they passed, so loud a noise was kept up, that the swarm lost the notes of their queen, and became confused; they soon settled in a cluster upon an apple tree, from whence we removed them to a straw hive, which we chanced to have on hand.—They liked their new abode so well, that they gave up their migratory habits, and for several years they annually furnished us with new swarms and a good supply of honey. After five or six years, however, we lost the whole by not guarding them sufficiently against the attacks of the bee-moth.—*American Agricult*

HOW IS WOOL?

As everything in the market has an "upward tendency," as the brokers say, it is fair to infer that wool ought to rise in proportion to other merchandise. Manufacturers, however, have started the idea that wool must be an exception, and instead of rising, must fall a *peg* or two from last year's prices. They assert that the cause of this is owing to the great amount of woolen cloth that is to be forced into our markets at a cheaper rate, from Germany. They say the manufacturers in that country, anticipating trouble from the surrounding wars, are pushing their goods into sale, and hence wool will be reduced in price some ten cents lower than last year. May-be so—we shall see what we shall see. It is best not to be frightened because the Germans are in trouble. It is pretty evident that wool, though it may be depressed some at first, will be in good demand before fall, and although it may not go beyond the average of prices for the past year, will come up to it before winter.—*Maine Farmer.*

Inquiries and Answers.

Draining.—I have a piece of land, one-half of which is low, but not marshy. Late in the spring of the year, and always after protracted storms, the water settles on the low part, and remains for some time. I wish to bring this piece of land into good cultivation. There is no waste for the water to run off, as the land is higher above it. There is about an acre submerged—the water being about three feet deep. Would it be practicable to underdrain, and in what manner could it be done the cheapest? I would like your experience, and also of those of your readers who have experimented in that way.—Joan S. Mallary, *Bloomfield, N. J.*

It is impossible to give an answer to this inquiry, without more definite knowledge of the lay of the land. If all the land around is higher than the spot to be drained, of course, as water will not run up hill, it cannot be drained except by pumping it up, or by sinking a shaft to some porous subsoil, if there is such beneath, and filling it up with stones.—The first thing in all drainage is the main outlet; if this can be obtained sufficiently deep, underdraining is comparatively easy work.—Without a good deep main ditch, underdrainage is impossible.

To Destroy Caterpillars.—My trees this spring are unusually full of the cocoons of the caterpillar. Can you suggest any effectual means of destroying these depredators?—W. B., *Lockport, N. Y., 1854.*

We were on the farm of the Messrs. Hayward, near this city, a few days since, and observed that, as they walked through their fine orchards with us, whenever a cocoon was seen, they stopped and removed it with the hand, rolling it into a lump and treading on it. This, they said, was a "sure cure." They had no faith in quack medicines. Certainly nothing could be more effectual than this plan, and, we think, nothing more expeditious. If the cocoons are too high to be reached by hand, they use a pole, twisting the cocoon round it.

Paint.—Which is the lasting white paint for houses; pure zinc alone, or pure Brooklyn white lead alone, or one coat of the lead and finish up with the zinc? How should the oil be prepared for the outside, or is it best applied in the raw state?—*Gorham Centre, May 25, 1854.*

Orchard and Garden.

CURRANTS AND CURRANT BUSHES.

Every garden has its Currant bushes, yet few of these supply the quantity, and still less the *quality*, of fruit which they might were they properly cultivated. The currant row, perhaps, is set against the fence, and full of grass and briers, and left unpruned to its own hedge-like growth. It produces but a small return of inferior fruit—as different from that grown by healthy and properly trained bushes as can well be conceived. Pruning, manuring, mulching, and a favorable situation, will astonish you by their results. The matter is one of interest to the readers of this department; so we propose a few hints on the propagation, pruning, varieties, &c., of the currant.

"The currant," says Thomas, "from its hardiness, free growth, easy culture, great and uniform productiveness, pleasant flavor and early ripening, is one of the most valuable of our summer fruits." These causes, also, make it one of the most common and generally cultivated. Its propagation is by cuttings, and a very simple and easy matter. A yearling shoot, eight to twelve inches long, taken off close to the old wood, and planted about 6 inches of its length in the ground, in spring, will make a strong, well-rooted plant in autumn. If it is desired to train up to a single stem, the eyes should be all cut out except for a few inches at the top—otherwise suckers will be produced. They can also be grown by layering, or by suckers from established bushes—though cuttings will make the handsomest plants.

While speaking of growing new bushes, it may be well to remark upon the renovation of old ones. Many gardens contain such thickets as above described, in which grass and weeds contend for the mastery—where the currants seem yielding in the strife. Cut out the briers—thin out the old bushes and suckers, and apply about two inches of old tan bark, or chip manure, and the grass will be smothered; and next year, manuring and further cultivation may go on. Meanwhile new bushes may be propagated—we have now some very fine ones grown from rooted shoots set last year. They have made an abundant growth of new wood over two feet in length, and near half an inch in diameter, and promise to bear finely the present season. They were hoed frequently during the summer, and this spring received a mulch of sawdust, an inch and a half deep.—We shall add a dressing of ashes, and in the fall a coating of barn-yard manure.

Currants need pruning annually. Without it they grow too closely to produce good fruit, the branches are weak, and the foliage light and unhealthy. Allow but few suckers—such only as are needed to supply the place of the old wood removed—or allow none, and train to a single stem, renewing by new propagations. The annual shoots often need shortening to promote the growth of the lateral fruit spurs, and care must be had to keep the branches at sufficient distance that the sun and air may have free admission. They can be trained as readily as any other plant, against a fence or wall, and the same advantages result.

The growth of the currant is vigorous, of course it needs large supplies of food. Its roots are small and fibrous, so it needs to be applied directly, and at least annually. Well rotted manure or compost—a light dressing—will keep them healthy and vigorous. Do not neglect to apply it.

The season of the currant may be prolonged by choice in situation. For early ripening train on the south side of a sheltered garden fence, and they will ripen a fortnight earlier than when not thus protected. Their ripening may be retarded by exposure in like manner.

As to varieties, they are not as numerous as might be expected. The currant has been a neglected fruit. The *Horticulturist* has a list of the best kinds and their characteristics, from which we condense the following:

The *Red* and *White Dutch* are old, good and popular, and by many thought the best of their kinds. The *Cherry* is the largest red currant known—the plant a very vigorous grower—moderately productive. The *Victoria* is a valuable late sort—color red. The *Red Grape*, *Long-bunched Red Dutch*, *Magnum Bonum*, and *Knight's Sweet Red*, are very similar to the *Red Dutch*, and are noted as superior by the *Horticulturist*. The *Prince Albert*, the *White Grape* or *Chasselas*, and the *Attractor* are good white varieties. The *Black Naples* is the best among black currants.—a.

Hoe Early.—The moment the rows of carrots, onions, beets, &c., can be distinguished, the hoe should be freely used. It is not too much to say that not one-half the labor will be required to kill weeds if taken in time, as would be needed if they are allowed to get full possession of the land. Again, not only are weeds more easily destroyed when hoed in season, but the stirring of the soil greatly benefits the young plants.

HOUGHTON'S SEEDLING GOOSEBERRY.

Mildew is the great drawback to the culture of gooseberries in this country. Many of our best varieties are so liable to it that they have been entirely abandoned. The primary cause of this is, doubtless, the climate, but careless culture has greatly promoted its ravages. England is not more noted for roast beef, plum pudding, and "good ale that's brown," than for gooseberries. The finest, largest, and best flavored gooseberries in the world will be found in Covent Garden market, or in Lincolnshire. Most of our varieties come from England; and however valuable they may be there, they seldom prove suited to our climate. We cannot but think that it would be to our own advantage, not only to pay more attention to the native varieties we already possess, but also to the raising of new seedlings adapted to the various localities where they are originated. Our country is so extended that it is unreasonable to expect a variety of fruit to be equally well adapted in each and all of the various states from Maine to California.

Houghton's Seedling is said to be less affected by mildew than any other variety.—Certain it is that it is less affected than most others, especially of the foreign varieties. The berry is rather small, as may be seen by our engraving; oval; the skin thin, reddish brown; the flesh fine, very tender, sweet and of a fine delicious flavor. It is a very superior gooseberry for the dessert; it is also excellent for cooking, and is in good condition for this purpose for about four weeks. It is a great bearer and very thrifty. The *Horticulturist* says:—"We think very highly of *Houghton's Seedling* gooseberry. It is much inferior in size, beauty, and flavor, to the large English varieties, such as Crown Bob, Warrington, Whitesmith, &c.; but then it is more at home in our climate. It grows freely, propagates easily, bears most abundantly, and the fruit is comparatively, though not wholly exempt from mildew. The fruit answers every purpose, when it is used in the green state, about as well as any. It should be at least one among every collection."

To avoid mildew as much as possible, we know of nothing better than close pruning and very high manuring of good varieties and young bushes. The ground should be a rather retentive loam well underdrained, and in a cool, somewhat shady place. The finest gooseberries, taking them as a whole, we ever saw, grew on the bank of a shallow ditch which conveyed the drainage of the barn-yard, &c.—We believe it is impossible to make ground too rich for gooseberries.

Melon Bug, Turnip Fly, etc.—The daily dusting of choice melons, cucumbers, early turnips, etc., with powdered charcoal or other black powder, will materially prevent injury from the above insects, as they will not frequent plants so treated. Later in the season, when grubs annoy cabbage and other small plants, slices of turnip may be placed on the beds between the plants, and the grubs will always be found on these at daylight, and may easily be removed. Slight salting of the beds before planting, will also deter grubs from annoying the plants, or rather will remove them altogether from the beds.—*Working Farmer.*

We regard the old method of powdering the plants with wood ashes, early in the morning when the dew is on, not neglecting the under portions of the leaves, as about the best application that can be made. When properly attended to—that is, done well and repeated two or three times—the vermin will make themselves scarce.—*Ger. Tel.*

WEEDS IN DOOR-YARDS.

One prolific source of spurious vegetation on our farms, is the neglect of which too many of our agricultural friends are guilty, to destroy, at the proper season, the weeds which befoul their door-yards, and unoccupied places by the roadside.

As the soil in such places is almost invariably affluent in the principles of vegetable nutrition, those weeds which are indigenous, ordinarily flourish with great luxuriance, and if not eradicated with a timely hand, produce an abundant crop of seeds, a very considerable proportion of which find their way in time, and by a variety of ways, to the fields and cultivated grounds, where they radicate, and render the labor of cultivation perplexing and unprofitable. Never suffer a weed to mature on your premises; cut down, root up and annihilate all. This is the only true policy. Thistles, white-weed, mullen, burdock, chickory, and a host of other indigenous and exhausting productions, which are of little or no value, are ever ready to spring up, and abridge the profits of the farm, and require an idle hand to hold them in check. All weeds are gross feeders, and sup the soil more than cultivated plants of equal size and weight.—*N. E. Farmer.*

Mulching Gooseberries.—An article is going the rounds of the papers, showing the advantages of mulching gooseberries—that it is a remedy for mildew, &c. Now, we would say to the writer of that article, and to those copying it, as well as to every reader of it, that it is necessary to the successful cultivation of small fruit *that they should be mulched*—the gooseberry, the raspberry, the blackberry, the currant, and even the strawberry—the latter with tan. To attempt to cultivate small fruits, without mulching, will assuredly fail, after the first year or two, as we have found out to our cost; but *with* careful, repeated mulching—it matters little what the material is—it will be next to impossible to fail, provided, of course, that the other necessary attention is bestowed. We don't know what a mildewed gooseberry is, since adopting this method, and propagating the English Silver variety, (we believe it is called.)—*Germantown Telegraph.*

Peach Blossoms.—In trimming a row of peach trees yesterday (May 17,) set to answer the purposes of a hedge to shelter the northwest side of the garden, we found the limbs quite near the ground in full bloom, and one limb which had grown into the midst of a thick quince bush was also in bloom, while every other branch on the tree had not only not blossomed, but was nearly dead. The branch in the quince bush was four feet from the ground. Several other branches were at about the same distance up, but unprotected, and the bark shriveled and tough, and had no signs of blossom or leaf.

Has any person ever attempted to protect branches of the peach tree by bringing them together in the autumn, and covering them with matting or protecting them in any way, other than by snow? The fruit is certainly worth a good deal of an effort to ensure its safety.—*N. E. Farmer.*

Cure for Melon Bugs.—Dr. Hull, of Newburgh, raised a large crop of melons by a process thus stated in the Horticulturist:

Bugs were completely expelled by watering the plants daily with a strong decoction of quassia, made by pouring four gallons of boiling water on four pounds of quassia, in a barrel, and after twelve hours, filling the barrel with water. The intolerable squash or pumpkin bug was thoroughly driven off by a decoction of double strength, containing a pound of glue to ten gallons, to make it adhere. The result was, a product of sixteen hundred superb melons, on less than one-sixth of an acre of ground.

How to send Plants by Post.—If a small tuft of the plant with the earth on is wrapped in damp brown paper, and then enclosed within sheet lead, such as tea chests are lined with, it will travel securely for a week.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending May 23, 1854.

J. Borch, of Cragg Hall, near Macclesfield, England, for improvement in constructing ships for safety and escape.

Peter Peal and Chas. Tyler, of Philadelphia, assignors to W. P. Cresson and R. Patterson, of same place, for improvement in lathes for turning the interior surface of hollow ware. Patented in England April 9, 1853.

J. Edmundson, of Salford, England, and C. Haworth, of Marsden, England, executors of T. Edmondson, deceased, late of Salford, aforesaid, for improved machine for printing railway and other tickets. Patented in England March 19, 1854.

E. A. Lee, of Roxbury, for improvement in piano forte action.

G. B. Turner, of Cuyahoga Falls, for improved smut machine.

A. N. Norton, of Richmond, Ind., for improved primer for fire-arms.

L. A. Miles, of Hopkinsville, Ohio, for improved pump valve.

R. P. Adams, of Clinton, Ill., for improved excavator for fence posts.

H. T. Anthony and F. Plagbus, of New York, for improved apparatus for the manufacture of daguerreotype cases, &c.

I. Babbitt, of Roxbury, for improvement in hones. Patented in England March 30, 1854.

Hiram Babbitt, of Nashua, for improvement in ratchet lever.

J. Beach, of De Ruyter, for improvement in cheese hoops.

A. T. Clark, of Lancaster, for improved mode of balancing window sashes.

H. A. Chase, of Boston, for improvement in counterpoise to cast locomotive wheels.

J. Curtis, Chicago, for improved wind mill.

E. Davis, of Chicago, for improved self-acting power press.

L. Danforth, of Buffalo, for improved machine for making book covers.

J. F. Hayes, of Philadelphia, for improvement in hot-air furnaces.

A. Jacobs, of Ithaca, for improved apparatus for regulating the supply of feed water to steam boilers.

J. McMullen, of Baltimore, for improved mechanical means for preventing incrustation in steam boilers.

J. Myers and R. G. Eunson, of New York, for improved machine for sawing thin boards, &c.

J. Pigot, of Brooklyn, for improvement in apparatus for making paddle-wheels.

T. S. Steadman, of Murray, N. Y., for improvement in chair harresters.

L. C. Suggett, of Lexington, Ky., for improvement in processes for treating hemp.

J. C. Strode, of West Chester, Pa., for improved hydraulic ram.

R. L. Wright, of Blue Rock, Pa., for improvement in tire bending machines.

R. & T. Winans, of Baltimore, for improvement in locomotive tenders. Ante-dated May 9, 1854.

T. W. Brown, of Boston, assignor to Wm. W. Mead, of same place, for improvement in button hole cutters.

A. Mansure, of Philadelphia, assignor to Farr & Thompson, of Philadelphia county, Pa., for improved bracelet clasp.

RE-ISSUE.

Wm. H. Seymour and D. S. Morgan, of Beckport, N. Y., assignors of N. Platt, (formerly of Ottawa, Ill.,) for improvement in harresters.—Patented June 12, 1849.

THE SCIENCE OF BLACKSMITHING.

The *Scientific American* says:—Sawing heated iron and steel is not known or thought of by blacksmiths; and when several forks or branches are to be formed from one stock, even if the branches are required to remain eventually nearly in contact and parallel to each other, the usual method is to split the end of the iron with an awkward chisel, thereby deforming the edge of each branch, on which account the edges must be bent asunder for the purpose of hammering, squaring and shaping the edge of each; after which they are brought together as well as may be, often retaining a roughness in form if not a deficiency in size and strength near the junction of the branches. Instead of this tedious process, the iron, when heated, may be put in a vice, and the ends may be readily slit with a suitable saw, which would save much labor in hammering and filing. A saw for this purpose should be made thicker at the sides than at the back, and with uniform teeth about one-twelfth of an inch apart. The saw when used must be often dipped in water, to prevent its becoming too much heated. There is also a method of sawing or cutting hardened steel, which is not so generally known as should be. A circular piece of thin iron plate, being adjusted to a lathe or by other means put into violent rotary motion, will readily cut off a file, a cutting tool, or tempered steel spring, without drawing or reducing the temper. There is much mystery in the wonderful effect of this buzz, and its cutting property is attributed to electricity. It answers a convenient purpose, however, when the shape and form of articles are required to be altered without affecting their temper. It furnishes a convenient method for cutting teeth to large saws, but is objectionable on account of the newly cut surfaces being left so hard that they cannot be readily cut with a common file. Connected with the subject of "mysterious effects," it may be stated that a bar of iron, of almost any size, may be instantly sundered, while hot, by the simple application of a piece of roll brimstone. A knowledge of this fact will be useful, when some piece of iron work is required to be severed but which, as is sometimes the case, is so constructed and situated that no ordinary chisel or cutting tool can be brought to apply.—Holes may be instantly perforated through bars or plates of heated iron by the application of pointed pieces of brimstone. This phenomenon is curious, though it seldom affords much practical utility.

Deadening Timber.—When the bark slips freely in June, July or August, is the best time to girdle trees. Cut the small growth three feet above ground; the roots do not sprout and the stumps are more easily removed.

IRON SHUTTERS.

Charles Reed, of this city, has taken measures to secure a patent for an improvement in rolling iron shutters. The improvement consists in bending or otherwise forming the slats so as to produce a recess in the form of part of a circle within each edge of the back side, one of such recesses being for the purpose of receiving the joints of the hinges or chain to which the slats are attached, and preventing it from causing so great a protuberance as is usually the case on the back side, the other being for the purpose of receiving the prominence on the front, which is caused by the recess on the back of the next slat. The circular interiors of the recess, and the exterior prominences of the slats, are concentric to the axes of the joints or hinges, and fit together in such a way as to allow the free working of the joints, and at the same time strengthen them. When the shutter is unrolled the prominences on the exterior of the slats have the appearance of a number of parallel beads, which conceal the joints and give the shutter an ornamental appearance on the outside.—*Sci. Am.*

Iron Cottages.—We have been informed that an Association has been formed in the city of Brooklyn for the purpose of building iron structures, especially the cheaper kind of cottages. It has been asserted that they can build a very neat cottage for about $500—one half the price of a frame one of the same dimensions; this we believe is not possible; at least we think that iron houses built for such prices must be of very little worth. We do not know how much metal would be required for a two story cottage, but $500 can purchase 55,000 lbs. of common coarse castings, or at 4 cents per lb., the price of fine castings, it would purchase 12,500 lbs.—a little over six tons.—The house indeed must be very small, or the castings very light, that will not weigh more than this amount of metal. We, however, sincerely wish success to this Association, and hope it will be able to introduce a cheap ornamental and solid class of iron structures of the cheaper kind.—*Sci. Am.*

Coffee Leaves.—A late Brazil paper contains further evidence in regard to the substitution of the leaves for the berry of the coffee tree. This paper states that Brazil exports 250,000,000 lbs. of coffee per annum, and that the leaves are really more valuable than the fruit, though not yet used as an article of export. The infusion of coffee leaves is more nutritious and more invigorating than tea, and is preferred by all who have tried it to an infusion of the coffee berry. The leaves are treated in the same way as the berries, by roasting.

Plastic Cement.—H. B. Hustrayhe and R. J. Gibron, of London, England, have invented a cement formed of clean washed river sand, blue-lias lime and common cement, in about equal proportions. This composition is moulded into the form of bricks or slabs, and without the aid of fire, it dries quickly, and resists the action of the atmosphere.

Domestic Economy.

Fritters.—Take one egg and two tablespoonfuls of sugar, beat them thoroughly, then add one tea-cup of sweet milk, one tea-spoonful of saleratus, a little salt and nutmeg; stir as thick as for pancakes; heat lard the same as for any fried cakes, dip a clean spoon into the hot lard to keep the dough from sticking to it, and then into the dough, filling the spoon, about half full each time, so that the cakes when fried, will be well done, and of uniform size.—w.

Warm Cake.—Take two quarts of warm water, a gill of good hop yeast, make a thick batter, let it stand in a warm place to rise: set it away. It will be fit for use the next day.—Take a pint for one tinful; a tea-spoonful of soda; half the quantity of shortening that is required for sour milk; mould it into small biscuits—can be baked immediately or let rise.—Put some more warm water to the sponge that is left; set it away. Good crackers can be made of the sponge with a little shortening and moulding very hard: bake immediately.—Whoever uses this mixture will find it a substitute for sour milk.—*Arthur's Home Gaz.*

Spring Beer.—The following is a receipt for "first rate strengthening beer," for family use; and if it does not make a very delicious beverage, it will produce one that has probably more *bark* than *bite*:—Take ½ oz. orange peel, ½ oz. Virginia snake root, and 1 oz. Peruvian bark—put these into 6 quarts water, and boil the same down to 4 quarts. Add 1 pint molasses, and 1 pint yeast. Let it stand about 20 hours—then strain and bottle for use.

Valuable Receipt.—Mr. A. Bronson, of Meadville, Pa., says from fifteen year's experience, he finds that Indian meal poultice covered over with young hyson tea softened with hot water, and laid over burns or frozen flesh, as hot as can be borne, will relieve the pain in five minutes. If blisters have not arisen before, they will not after it is put on, and that one poultice is generally sufficient to effect a cure.

Fly Poison without Arsenic.—The following preparation is much used in Europe for the destruction of flies:—Quassa, eight parts; water five hundred parts; molasses, one hundred and twenty-five parts. Boil the quassa and water ten minutes; strain and add the molasses. The preparation can easily be made by any one. Flies are attracted by this and soon killed.

Used tea leaves, if put into decanters and thoroughly shaken about with a little water, will clean and polish the insides.

Educational.

PUBLIC SCHOOLS OF ROCHESTER.

The eleventh annual report of the Superintendent of the Public Schools in the city of Rochester (R. D. Jones, Esq.,) has been published, pursuant to a resolution of the Board of Education, passed March 20th, 1854. It contains full statistical tables in regard to the schools of the city, as also tables of the comparative cost of public school education in other cities; a list of the members of the Board, Standing Committees, teachers, and a catalogue of text books, &c., &c.

The report does not include the entire school year, inasmuch as that closes in August next, and the report is required to be made in March. It appears by this document, that the number of volumes in the school libraries of the city, is 14,786; the number of different scholars that have attended the public schools thus far during the year is 7,611. The whole number of children of school age on the last day of December, 1853, was 14,786; of which number 8,326 attended the public schools, and 2,145 attended private select schools, leaving a balance of over 4,000 non-attendants, a result truly lamentable in a city so well provided with a noble system of free schools. The tax upon the city for school purposes was $19,250; received from the State, $8,134.

At the commencement of the present school year, seventy-eight teachers were engaged, at salaries as follows:

Ten at	$750 a year.
One at	700 "
One at	600 "
Seven at	265 "
Eleven at	235 "
Twelve at	200 "
Two at	190 "
Twenty-five at	180 "
Nine at	175 "

Since the commencement of the present year, four additional teachers, not including the evening school, have been employed, making the number now in the schools, 82.

We shall have occasion to refer to this report again hereafter, giving some interesting remarks of the Superintendent touching the matter of evening schools.

TAKE THE PAPER.

There is one important reason, if no more, (and there are hundreds,) why every family should be supplied with at least one good substantial family newspaper; namely, for the sake of your children. It is your duty to educate your children, to create in them, if possible, a taste for reading; not novels, but a style of composition that will teach them to think, to act, to turn over matters in their own minds, to reason from cause to effect. This you cannot more easily do, than by throwing before them reading of a proper character. Experience and observation have taught me, that this is one effectual means of teaching the child to read.

The child must read well, before it can learn much else from books to advantage. I have uniformly found it the case, that children of the same age, having the same advantages at school, possessed of equally large minds, and quick perceptive faculties, though deprived at home of proper reading matter, differ materially in point of good reading, good taste, and consequent ability to learn rapidly. This is one of the many reasons, why each kitchen, dining-room and parlor, should be amply supplied with books and papers.

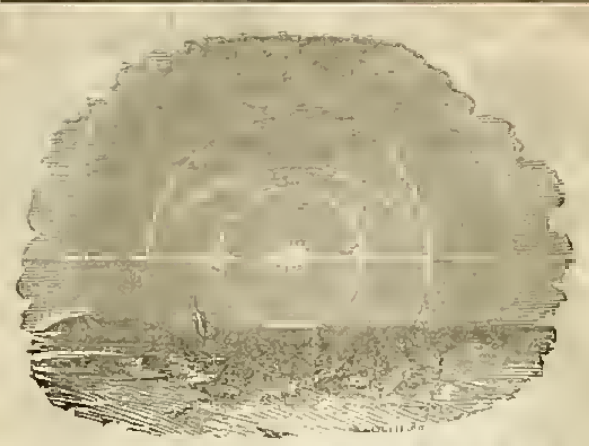
A friend of mine who had not taken a paper for a long time until within a year, says, "By taking one paper the past year, I have saved in shoes and clothes for my children, sufficient to pay for five papers." It is a paying business.

C. L. B.

Fillmore, May 10th, 1854.

Connecticut State Teachers' Association.—A very full, animated and enthusiastic educational meeting of the Connecticut State Teachers' Association took place on Tuesday and Wednesday, (May 9th and 10th,) day and evening, in the Medical College, New-Haven. Addresses were delivered, by Dr. Hooker on the Method of Teaching Physiology in Schools, and by the Rev. Dr. Perkins of West Meriden on Education as developed by God's Plans with Man. Both addresses are reported to us as ripe and valuable intellectual efforts. Prof. Philbrick, Principal of the State Normal School, likewise spoke; and also Mr Barney, Superintendent of the Schools of Ohio. Professors Olmstead and Thatcher of Yale College, Mr. Francis Gillette, Prof. Silliman, Sr., D. W. Camp of the Normal School, W. S. Baker, the Rev. F. B. Huntington, and others, were also among the speakers. The meetings are described as beyond precedent earnest and brilliant.—*Tribune.*

What is Aristocracy?—In reply to this question, Gen. Foy, a distinguished orator in the French Chambers, gave the following answer:—"Aristocracy in the 19th century, is the league, the condition of those who would consume without producing, live without working, know without learning anything, carry all honors without deserving them, occupying all the places of government without being able to fill them."



PARHELIA, OR MOCK SUNS.

Mock suns, in the vicinity of the real orb, are due to the same cause as haloes, which appear in connection with them. Luminous circles, or segments, crossing one another, produce conspicuous masses of light by their united intensities, and the points of intersection appear studded with the solar image. This is a meteorological rarity in our latitude, but a very frequent spectacle in the arctic climes. In Iceland, during the severe winter of 1646, it is related that the sun, when seen, was always accompanied by two, four, five, and even nine of these illusions. Captain Parry describes a remarkably gorgeous appearance, during his winter sojourn at Melville Island, which continued from noon until six o'clock in the evening. It consisted of one complete halo, 45 degrees in diameter, with segments of several others, displaying in parts the colors of the rainbow.—Besides these, there was another perfect ring of a pale white color, which went right around the sky, parallel with the horizon, and at a distance from it equal to the sun's altitude; and a horizontal band of white light appeared passing through the sun. Where the band and the inner halo cut each other, there were two parhelia, and another close to the horizon, directly under the sun, which formed the most brilliant part of the spectacle, being exactly like the sun, slightly obscured by a thin cloud at his rising or setting. A drawing of this parhelion is given by Captain Parry, who remarks upon having always observed such phenomena attended with a little snow falling, or rather small spicula or fine crystals of ice. The angular forms of the crystals determine the rays of light in different directions, and originate the consequent visual variety. We have various observations of parhelia seen in different parts of Europe, which in a less enlightened age excited consternation, and were regarded as portentous. Mathew Paris relates in his history:

"A wonderful sight was seen in England, A. D. 1233, April 8, in the fifth year of the reign of Henry III., and lasted from sunrise till noon. At the same time on the 8th of April, about 1 o'clock, in the borders of Herefordshire and Worcestershire, besides the true sun, there appeared in the sky four mock suns of, in red color; also a certain large circle of the color of crystal, about two feet broad, which encompassed all England as it were. There went out semi-circles from the side of it, at whose intersection the four mock suns were situated, the true sun being in the East, and the air very clear. And because this monstrous prodigy cannot be described by words, I have represented it by a scheme, which shows immediately how the hearers were circled. The appearance was painted in this manner by many people, for the wonderful novelty of it."

The above is a pretty correct engraving.

Essay on Health.

[Written for the Rural New-Yorker.]

TREATMENT FOR CONSUMPTIVES.

I am no physician. I know too little of the human system, but I know less of medicine.—Yet I am often reminded that fearful diseases are preying upon mankind, and that of those diseases consumption is regarded both by the doctor and by him who is unskilled in medicine, as one of the most surely fatal. It creeps silently and stealthily upon its prey, it makes its approaches sometimes in the most gradual manner, yet when its presence once becomes known, and its victim feels its grasp upon his vitals, he regards it as but little less than a miracle to succeed in his endeavors to escape from the doom which, under such circumstances, has come to be generally regarded as almost inevitable.

Consumption! It is a household word, but how full of terrors! Consumption! It is a disease, the very idea of which is associated with pallid cheeks, with languid spirits, with wasted forms, and with faded flowers. At its mention, the King of Terrors, in his spectral form, rises before us. It is synonymous with death.

True, by the exercise of care, and by the application of skill in its earlier stages, it may sometimes be wholly arrested, or greatly retarded in the consummation of its desolating work. Occasionally there may be instances in which persons who were apparently in an advanced stage of consumption, have been cured either by the efficacy of medicine or by a change of climate, and the consequent inhalation of a different atmosphere from that in which the disease was induced. But the main object of this article, is to draw attention to a letter written by N. P. Willis, and published not long since in the *Home Journal*, containing some most excellent advice respecting the treatment of consumptives. It was written in reply to another from a Presbyterian Clergyman of consumptive habit, who had tried traveling at the South, without receiving any material benefit; who keeps his room only moderately warm, taking care that it is properly ventilated. He remains without doors much of his time; takes regular exercise, and in the course of the day a brisk walk of half a mile. But he does not get well, and he wishes to know of Mr. Willis what course he has pursued, that he is no longer classed among consumptives.

After premising, among other things, that "the patient who troubles himself the least about his disease, (or who leaves it entirely to his doctor,) but who perseveringly *eats votes* it by the high condition of the other parts of his system, is the likeliest to recover"—that two persons are seldom the subjects for precisely the same medical treatment, or diseased in precisely the same locality—that our friends, the physicians, are better geographers than we, as to where the healing is wanted—though they too often take it for granted that the patient keeps the rest of his body in proper training for recovery—Mr. Willis continues: "I went to the Tropics, as a last hope, to cure a chronic cough and blood raising, which had brought me to the borders of the grave. I found a climate in which it is hard to be unhappy about anything—charming to live at all—easy to die. (At least those who were sure of dying, and did die, and in whose inseparable company I thought I was, were social and joyous to the last.) The atmosphere of that Eden-latitude, however, is but a pain-stilling opiate, while the equator might be called a kitchen-range for a *Sardanapalus*, and the Antilles are but tables loaded with luxuries. The Caribbean sea is the kingdom of the present moment. The past and the future are its Arctic and Antarctic—unthought of except by desperate explorers. Hither are sent invalids, with weakened resolution, to make a pilgrimage with prescription and prudence. You may see by the book I have just published, (Health Trip to the Tropics,) with what complete forgetfulness of care or caution I made one of an invalid company for months.

"Was anybody going to shut me up in a bed-room with such nights out of doors? Was anybody going to be dull and abstinent with such merry people, and a French breakfast or tempting dinner on the table?

"I reached home in July, thoroughly prostrated, and in the opinion of one or two physicians, a hopeless case. Coughing almost the whole of every night, and raising blood as fast as my system could make it. I had no rest and no strength. I lingered through the summer, and as the autumn came on, and the winter was to be faced, I sat down and took a fair look at the probabilities. With the details of this troubled council of war I will not detain you; but, after an unflinching self-examination, I came to the conclusion that I was, myself, the careless and indolent neutralizer of the medicines which had failed to cure me—that one wrong morsel of food, or one day's partially neglected exercise, might put back a week's healing—and that, by slight omissions of attention, occasional breaking of regimen, and much too effeminate habits, I was untrue to the trust which Gray, my friend and physician, had made the ground of his prescriptions.—And to a minutely persevering change in the comparative trifles, I owe, I believe, my restoration to health. There was not a day of the succeeding winter, however cold or wet, in which I did not ride eight or ten miles on horseback. With five or six men, I was for most of the remaining hours of the day, out of doors, laboring at the roads and clearings of my present home. The cottage of Idlewild was then unbuilt, and the neighboring farm-house, where we boarded, was of course indifferently warmed; but by suffering no state of the thermometer to interrupt the morning cold bath, and the previous friction with flesh-brushes, which makes the water as agreeable as in summer, I soon became comparatively independent of the temperature in doors, as my horse and axe made me independent of it when *out* of doors. With proper clothing to resist cold or wet, I found, to my surprise, that there was no such thing as disagreeable weather to be felt in the saddle; and when a drive in a wagon or carriage would have intolerably irritated my cough, I could be all day in the woods with an axe, my lungs as quiet as a child's. * * * * * *

"There are so few invalids who are invariably and conscientiously *untemptable* by those deadly domestic enemies, *sweetmeats*, *pastry* and *gravies*, that the usual civilities at a meal are very like being politely assisted to the grave. The care and nurture of the *skin* is a matter worth some studying; for it is capable not only of being negatively healthy, but positively luxurious in its actions and sensations—as every well-groomed horse knows better than most men. The American liver has a hard struggle against the greasy cookery of our happy country. The impoverished blood of the invalid sometimes requires a "glass of wine for one's stomach's sake," recommended by the Apostle. Just sleep enough, and just clothing enough, are important adjustments, requiring more thought and care than are usually given to them. For a little philosophy in your habitual posture as you sit in your chair, your lungs would be very much obliged to you. An analysis of the air we live and sleep in, would be well worth looking into occasionally. And there are two things that turn sour in a man without constant and sufficient occupation upon something besides the domestic circle—the temper and the ambition."

Mr. W. expresses the fear that he cannot sufficiently convey to his correspondent his own sense of the importance of a *horse* to an invalid. "In my well weighed opinion," says Mr. W., "ten miles a day in the saddle, would cure more desperate cases (particularly of consumption,) than all the changes of climate and all the medicine in the world."

A writer in the *Daily Globe*, (Washington,) in noticing this letter, says that he would have been in his grave forty years ago, had not similar instructions, given by a celebrated physician of the West, been implicitly obeyed. His injunction was—"*Live on horse flesh, in the open air—groom yourself as your horse is groomed, and cold bath after currying—eat for digestion, not for indulgence—give physic to the dogs, or leave it to the doctors!*"

Perinton, April, 1854. S. G. W.

DESTINY OF CHINA.

Dr. Bowring, the eminent Eastern traveler, in a lecture lately delivered in London, on the eve of his departure for the east, took occasion to say that, in his opinion, the Empire of China was destined to fulfil a great mission, by the emigration that was now going on from thence throughout all the eastern nations. Such was the over-population of China, that there was not a foot of it scarcely but what was cultivated. Such was the over-population, in fact, that notwithstanding the most violent interdicts against emigration, its surplus streams were overflowing the countries of the east. In the Island of Java he found 25,000; in the islands of the Indian Archipelago there were not less than 70,000; whilst in San Francisco there had been settled 25,000 more; and great numbers were emigrating to Australia, and the islands of Polynesia, or wherever there was a field of labor open to them. It appeared to be a law of Providence that the superior races of mankind should supplant the inferior, and we saw in the progress of time the inhabitants of the West India Islands swept away, that the Anglo-Saxon population was intruding and removing (he would not say destroying) the red Indian tribes of America. So the Chinese race was setting aside the Malay in the same way that they (the Malays) had set aside the Dyaks.

TO YOUNG MEN.

It is easier to be a genius in some things than in others, and, as a general rule, it is much more practicable where men are liberally paid and generously honored. Architecturing, civil engineering, inventive art, are now rising into the first rank of professions. The thrifty world needs the help of such talents, and it is glad to pay for them, because thereby it ministers to its own pride, luxury, and gratification. Men are determined to multiply great and gorgeous buildings. Fine houses were never so popular. Bridges, viaducts, churches, are in the ascendant. Tunnels and railway wonders fill all eyes. The literature of solid masonry is the uppermost charm, and magnificent poems are spanning rivers. Mechanic art rules the day and adorns the night. And so, young men, if you want to take your place among sun, moon, and stars, go to work at once, and bravely too, and convert granite and marble into the practical English language of the year '54; and thus do your own printing and publishing, for the benefit of society and your empty pockets.—*New York Times.*

Use Minutes.—It is asked, says Channing, how can the laboring man find time for self-culture? I answer that an earnest purpose finds time, or makes time. It seizes on spare moments, and turns fragments to golden account. A man who follows his calling with industry and spirit, and uses his earnings economically, will always have some portion of the day at command. And it is astonishing how fruitful of improvement a short season becomes, when eagerly seized and faithfully used. It has often been observed that those who have the most time at their disposal, profit by it the least. A single hour in the day given to the study of some interesting subject, brings unexpected accumulations of knowledge.

Birds are the poor man's music, and flowers the poor man's poetry.

A place for every thing have, and every thing in its place.

Sunday Reading.

[Written for the Rural New-Yorker.]

SHE IS LAID IN THE GRAVE.

She is laid in the grave! but her bright spirit soars
To the regions of bliss from these sorrowful shores;
She moved in a circle of loved friends while here,
Who saw she was formed for a happier sphere.

Oh! sad are the sighs for her absence I heave,
And sad are my tears—tho' 'tis fruitless to grieve;
Yet oft, through the dark mists of sorrow, I see
In fancy, my mother still smiling on me!

Wherever I go, there's no object I trace
Can bear from my mind her loved form or her face;
Nor time can my soul in forgetfulness steep;
Her dream-wafted image still smiles on my sleep.

In nights calm and clear, 'mid the bright orbs I try
To trace her bless'd home in the beautiful sky;
And I gaze on some star, 'till in fancy I see
Her far-shining spirit still smiling on me!

South Livonia, N. Y., 1854. C.

RESIST NOT EVIL.

The pastor Oberlin, having received warning that some uncivilized and brutal persons had formed a plan for waylaying and inflicting upon him a "severe castigation," took for his text in church, on the Sunday when he had been told the outrage was to be perpetrated, those words of our Saviour, "But I say unto you, that ye resist not evil: but whosoever shall smite thee on thy right cheek, turn to him the other also;" and proceeded, from these words, to speak of the Christian patience with which we should suffer injuries, and submit to false surmises and ill-usage. After the service, the malcontents met at the house of one of the party to amuse themselves in conjecturing what their pastor would do, when he should find himself compelled to put in practice the principles he had so readily explained. What, then, must have been their astonishment when they perceived the door slowly opened, and Oberlin himself stood before them! "Here I am, my friends," said he, with that calm dignity of manner which inspires the most violent with respect; "I am acquainted with your design. You have wished to chastise me because you consider me culpable. If I have indeed violated the rules which I have laid down for you, punish me for it. It is better that I should deliver myself into your hands, than that you should be guilty of the meanness of an ambuscade." These simple words produced their intended effect. The peasants, ashamed of their scheme, sincerely begged his forgiveness, and promised never again to entertain a doubt of the sincerity of the motives by which he was actuated, and of his affectionate desire to promote their welfare.—*Life of Oberlin.*

BEAUTIFUL SENTIMENT.

Ike Marvel, in his "Reveries of a Bachelor," thus writes:

A man without some sort of religion is at best a poor reprobate, the football of destiny with no tie linking him to infinity, and to the wondrous eternity that is begun within; but a woman without it, is even worse—a flame without a heat, a rainbow without a color, a flower without perfume. A man may in some sort tie his fruit hopes and his honors to this weak, shifting ground-tackle, to his business or the world; but a woman without that anchor called faith, is a drift and a wreck! A man may clumsily continue a sort of moral responsibility out of relations to mankind; but a woman, in her comparatively isolated sphere, where affection and not purpose is the controlling motive, can find no basis in any other system or right action but that of spiritual faith. A man may graze his thoughts and his brain to truthfulness, in such poor harborage as fame and reputation may stretch before him, but a woman—where can she put her hope in storms—not in heaven? And that sweet trustfulness—that abiding love—that endearing hope, mellowing every page and scene of life—lighting them with pleasant radiance, when the world's storms break like an army with smoking cannon—what can bestow it all but a holy soul, tied to what is stronger than an army with common? Who has enjoyed the love of a Christian mother, but will echo the thought with energy, and hallow it with a tear?

THE ACTIVE CHRISTIAN.

One can hardly resist the impression that multitudes have entered Zion's enclosure who have no heart in its mission, and no care for its prosperity. Of course they occupy no places of importance. They stand at no post of watchfulness. They guard no station of prayer. They hold up no hand by sympathy. They derive no grace, and all the difference noticeable on earth when they are gone will be a numerical diminution of the ranks of the church, and the song of heaven will not be strengthened by a perceptible note. But when a spiritually minded Christian, who has set his affection on things above, engages in duty for the church and its great Head, the real work is done, and the results remain. A spirit of consecration tinges with brilliancy every trifling deed of life, and causes the radiance of heaven to illumine it. 'Tis like the sun, bursting forth from a dark cloud, and throwing a flood of glory upon every object in nature, till each stone and leaf and spire of moss is resplendent with reflected beauty.—*Congregationalist.*

"Old Hundred."—The history of this old Psalm tune, which almost everybody has been accustomed to hear, ever since they can remember, is the subject of a work recently written by an English clergyman. Martin Luther has generally been reckoned the author of "Old Hundred," but it has been discovered that it was composed in the sixteenth century, by William Franc, a German. In the course of time it has been considerably changed from the original, and it is said, that, as it first appeared, it was of a more lively character than at present.—*Concord Rep.*

Miscellaneous.

(Written for the Rural New-Yorker.)

LIFE.

BY MRS. JENNY A. STONE.

A STREAMLET dashed in its sparkling pride,
Leaping in foam from the mountain side,
And a dimpled infant wandered there
Catching the drops in his sunny hair;
His Laugh rang out like a silver bell,
But wildly he wept as the darkness fell.
A smile and a tear!
A hope and a fear!
And such is the life of mortals here.

A maiden gazed on a lover's brow,
And listened again to a murmured vow,
The love-light flashed from her earnest eye,
Like a sudden star in a midnight sky;
But the gleam went out as a fading sun,
Weeping for him, the faithless one.
A smile and a tear!
A hope and a fear!
And this is the life of mortals here.

A mother gazed on an infant's face,
Seeking a lost one's smile to trace;
He had gone before to the silent land,
And she meekly bowed to the chastening hand,
For her child she lived,—but the baby slept,
And alone the stricken mother wept.
A smile and a tear!
A hope and a fear!
'Tis madness to laugh in a mourner's ear.

An old man lay on the bed of death,
And his bosom heaved with his labored breath,
Through the wide, wide world no more to roam,
He was nearing his real and final home;
And he passed away like the day-beam's light,
Fading so softly away from sight.
A smile and a tear!
A hope and a fear!
So endeth the life of mortals here.

LITERARY PIRACY.

When the editor of a daily or weekly newspaper steals an article from one of his cotemporaries, and leads it out as editorial, he very justly lays himself open to the charge of literary piracy, and is generally handled without gloves or mercy, by him whose brain-labor he has thus unscrupulously appropriated. There are a thousand new articles, chaste and beautiful, going the rounds from week to week, which the united judgment of the conductors of the press approves. They seize upon them instinctively, and re-publish for the benefit of their own readers. When and where these articles originated, it is impossible to tell. One copies a paper from the original, and neglects or fails to give credit; and then it passes from one to another, enlarging with each succeeding reproduction its sphere of usefulness, until nearly the whole reading public is made acquainted with its contents. It would be a matter of astonishment to a person noninitiated in the mysteries of the Sanctum, if he should look over for a week, the large list of exchanges in any extensive newspaper office, and observe the nearly simultaneous publication of a new and choice literary article, after it has passed first, or at least second hands.

Many of the copyists will give due credit where they can, and most, (not all,) will set the article up solid, which is notice, at least to the craft, that it does not originate with them. They would be quite willing to give the original publication credit for the article, if they knew where to bestow it; but that being out of their power, they do the next most honorable thing, in the way above mentioned.

There is, however, a class of exceptions to this rule of "honorable mention," existing in our country; and that is in those wide circulating periodicals, which make up a large portion of their contents, and that the most interesting portion, out of the pickings and gleanings of foreign periodicals and reviews. Blackwood, the Edinburgh, Westminster, North British, the London Quarterly, Chambers' Journal, Household Words, and others, are laid under contribution, and their choicest articles appropriated without mercy, and no credit given therefor. They are not even set solid, as a sign of non-originality; but they appear as editorials, and go forth as such to the world. Among the giant appropriators, Harpers' Magazine stands out conspicuous, and gains popularity and extensive circulation out of the fruits of other men's labors. The May number of this popular periodical is an illustration in point, where two or three, at least, of its most elaborate productions are thus unscrupulously obtained. One in particular, an interesting paper entitled "Shots and Shells," is taken from No. 3 of Chambers' Edinburgh Journal; and it is at this moment being re-published by the country newspapers, and credited to *Harpers' Magazine*. To this credit a prefix ought at least to be added, so as to make it read,—*Stolen by Harpers' Magazine.*

It is true that these articles read just as well at second hand, and there is no international copy-right to prevent their appropriation; and it is equally true that there are like literary piracies practiced on the other side of the Atlantic: but that is no argument against the adoption of the world-wide motto, "honor among thieves." Chambers, in the very number which publishes originally "Shots and Shells," has several selections which are credited to an "American Paper."

Very many of the thirty presses which were burnt in the great fire that lately destroyed Harpers' publishing house, were running on matter, the copy-right of which cost the publishers absolutely nothing.

POWER OF THE HUMAN INTELLECT.

Nothing illustrates the power of the human intellect more forcibly than the discoveries made in the field of Astronomy. Assisted by that potent instrument the telescope, which bears his vision forward into the realms of illimitable space, and led on to ineritable and unmistakable conclusions by mathematics, that handmaiden of the exact sciences, man is enabled to read the dream of nature, and to penetrate into the very council-chamber of the Almighty.

To one unaccustomed to such studies, it seems an unmitigated piece of assumption for the astronomer to say that such a planetary body moves through space at precisely so many millions of miles from the solar centre; that it progresses at such a rate of speed per hour; is of a certain dimension, and of such a density as compared with our own sphere.—And yet all these things are determined as accurately, and with as much precision as the topographer measures an acre on the earth's surface, as a railway engineer measures his rate of speed by the mile-posts along his iron way, or the weigh-master at the lock balances upon the scale the united weight of a canal boat and its cargo.

If any doubts exist in respect to the ability possessed by astronomers of determining all these things, and a thousand others equally astonishing, such doubts must be abandoned when we reflect upon the surprising accuracy with which they calculate, years before, the moment of an eclipse, the precise path it will take, the width of total obscuration, the length of its duration, and time of disappearance.—Two celestial bodies moving, one around the other, and both around a central luminary with the planes of their orbits not coincident, and both subject to disturbances and aberrations from the attractions of other planets, and moving at unequal rates and in elliptic curves, are so traced by the wand of the astronomer, that the whole world is made aware of the time the one casts its shadow on the other; and millions of eyes are turned at the precise moment to gaze upon the unrouted phenomenon. Surely such a result proves that "man is created a little lower than the angels"—and the prediction of the late remarkable solar eclipse, and the exact fulfilment of that prediction, are the forcible illustrations of the declaration.

HOPE AND MEMORY.

An old Poem of the North tells of a brave boy, who in his earlier days found his mother's cottage too narrow, mourned at tending the goats on the mountain side, and felt his heart swell in him like a brook from the melting of the snow, when he saw a ship shoot like an arrow into the bay. He ran from his mother and the goats. The Viking took him on board. The wind swelled the sails. He saw the hill-top sink in the blue deep, and he was riotously glad. He took his father's sword in hand and swore to conquer him houses and land by the sea. He also is a Viking. He has been all over the Mediterranean coast, and conquered him houses and land by the sea. But now, in his old age, his palace in Byzantium is a weariness to him, and he longs for the cottage of his mother. He dreams of the goats; all day the kids bleat for him. He enters a bark; he sails for the Scandinavian coast, and goes to the very cottage too narrow for his childhood, and eats again the barken bread of Sweden, and drinks its bitter beer; bares his forehead to the storm; sits on the rocks, and there he dies.

"Bury me not, I pray thee, in Egypt," said old Jacob, "But I will lie with my fathers; bury me in their burying place."

The scholar becomes antiquary; he likes not young men unless he knew their grandfathers before. The young woman looks in the newspaper for the marriages, the old man for the deaths. The young man's eye looks forward; the world is "all before him, where to choose." It is a hard world; he does not know it; he works little, and hopes much. The middle-aged man looks round at the present; he has found out that it is a hard world; he hopes less, and works more.

The old man looks back on the fields he has trod; "this is the tree I planted; this is my footstep;" and he loves his old house, cot, dog, staff, and friend.

In lands where the vine grows, I have seen an old man sit all day long, a sunny autumn day, before his cottage door, in an old arm chair, his dog crouched at his feet in the genial sun. The autumn wind played with the old man's venerable hairs; above him on the wall, purpling in the sunlight, hung the full clusters of the grape, ripening and maturing yet more. The two were just alike; the wind stirred the vine leaves, and they fell; stirred the old man's hair, and it whitened yet more. Both were waiting for the spirit in them to be fully ripe. The young man looks forward, the old man looks back. How long the shadows lie in the setting sun; the steeple a mile long, reaching across the plain, as the sun stretches out the hills in grotesque dimensions. So are the events of life in the old man's memory.—*Theodore Parker.*

Neatness and good order contribute to health, wealth and happiness; while opposite habits tend to disease, misery, poverty, vice and short life.

THE CIRCUMSTANTIAL EVIDENCE.

Some years ago I went specially to Clonmell assizes, and accidentally witnessed a trial which I never shall forget. A wretched man, a native of that county, was charged with the murder of his neighbor. It seemed that an ancient feud existed between them. They had met at a fair and exchanged blows; again that evening they met at a low pot-house, and the bodily interference of friends alone prevented a fight between them. The prisoner was heard to vow vengeance against his rival. The wretched victim left the house, followed soon after by the prisoner, and was found next day on the roadside murdered, and his face so barbarously beaten in by a stone, that he could only be identified by his dress. The facts were strong against the prisoner; in fact, it was the strongest case of circumstantial evidence I ever met with. As a form—of his guilt there was no doubt—the prisoner was called on for his defence. He called—to the surprise of every one—the murdered man. And the murdered man came forward. It seemed that another man had been murdered—that the identification by dress was vague, for all the peasantry of Tipperary wear the same description of clothes—that the presumed victim had got a hint that he would be arrested under the White Boy act—had fled, and only returned with a noble and Irish feeling of justice, when he found his ancient foe was in jeopardy on his account. The case was clear; the prisoner was innocent. The judge told the jury that it was unnecessary to charge them. They requested permission to retire; they returned in about two hours, when the foreman, with a long face, handed him the verdict "guilty." Every one was astonished. "Good God!" said the judge, "of what is he guilty? Not of murder, surely!" "No, my lord," said the foreman, "but if he did not murder that man, sure he stole my gray mare three years ago."—*Daniel O'Connell.*

RUSSIAN TROOPS.

There were about five hundred Russians quartered in the neighborhood of the khan.—They had that smart, soldierly look which is the effect of severe discipline. This I observed to be the characteristic of nearly all the Russian soldiers that I have seen in the Principalities. The exceptions are the young recruits, who of course are not yet properly formed. I have never observed any appearance of lightheartedness among the Russian soldiers even when off duty. It is true, that at times, in marching, whole battalions sing in chorus either the National Anthem, which is a fine, solemn air, or some wild melody, generally of a warlike character, interspersed with sharp cries and an occasional shrill whistle. These latter songs are particularly animated and spirit-stirring, and the quick rattle of the drum, which is the sole instrumental accompaniment, increases their exciting character. To the listener there is something sublime in thus hearing thousands of manly voices blended together in chorus, uttering sentiments of devotion to God and the Emperor, or of fierce defiance to the enemies of the Czar. But even in these exhibitions the sternness of military rule is seen. Upon the faces of the men thus engaged no trace of emotion is visible; their tread is measured; their forms are erect; they are obeying a command, and not an impulse. The emotions of the heart seem to have been drilled into order, and expressions of love or anger, devotion or revenge, are only awakened by the voice of their commander.—*O'Brien's Jour.*

Anecdote of Rothschild.—The movements of such a man as Rothschild was, were watched by the jobbers of the day, who, conscious of his superior information and judgment, were ready to take their cue from his proceedings. But the wary financier was usually an overmatch for the crowd. When he received some intelligence, which he believed would cause the funds to rise, he ordered the broker who usually transacted his business to sell out half a million of stock. This of course became known at once, and the fact alone caused a depression of one or two per cent.—Availing himself of this fall, Rothschild gave orders to other brokers not in his employ, to purchase to the extent of several millions at the reduced price, and in a day or two Capel Court was puzzled at learning good news when they were expecting bad.—*Household Words.*

A Tartar Inn.—On the arrival of a traveler, he is met by the comptroller of the table, who announces what there is to eat, and as the visitor selects his dishes, this official repeats them in a measured chant to the governor of the pot. Before commencing his repast, courtesy requires the traveler to invite everybody present to partake with him. "Come," he says, "come, my friends, and drink a glass of wine with me; come, and eat a plate of rice." And every one answers, "No, thank you; do you rather seat yourself at my table. It is I who invite you." And so the matter ends.—When the traveler rises to depart, the comptroller of the table again chants over the names of the dishes, observing this time to include the price in his song.

Musk.—The Empress Josephine was very fond of perfumes, and, above all, of musk.—Her dressing-room at Malmaison was filled with it, in spite of Napoleon's frequent remonstrances. Forty years have elapsed since her death, and the present owner of Malmaison has had the walls of that dressing-room repeatedly washed and painted; but neither scrubbing, aquafortis, nor paint, has been sufficient to remove the smell of the good Empress's musk, which continues as strong as if the bottle which contained it had been but yesterday removed.

Passion.—Nothing doth so fool a man as extreme passion. This doth make them fools which otherwise are not, and show them to be fools which are so.

Ladies' Department.

CONDUCTED BY A——E.

GENTLE SMILES.

The sweet young flowers of early spring
Are beautiful to me,
And bright the stars that shine
Upon the calm blue sea;
But gentle smiles and loving hearts,
And hands to clasp my own,
Are better than the brightest flowers,
Or stars that ever shone.

The sun may warm the grass to life,
The dews the drooping flower,
And eyes grow bright, and watch the light
Of autumn's opening hour;
But gentle smiles of tenderness,
And smiles we know are true,
Are warmer than the summer time,
And brighter than the dew.

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE FIFTH.

Tirlemont, Belgium, March, 1854.

Dear Cousin Katey:—I have just returned from a visit to the church of St. Germain, and feel benevolently inclined to impart to you the result of my observations, taking it for granted that the temples and the ceremonies of the Roman Catholic religion will be as new and strange to you, as they are to my Puritan eyes. This church, as I told you in one of my previous letters, is quite ancient, dating back to the eleventh century. Some parts of it are in the Roman style of architecture, others in what is called the *transition*, when the semi-circular arches which characterize the Roman order, began to elongate into the pointed form which prevails in the Gothic. The plan of the building, like the majority of Catholic churches, is a cross, but with a peculiarity which is not often met with, and which is well worthy of notice. The upper part or head of the cross, instead of forming a straight line with the grand nave, is inclined at an angle of about seven degrees to the left. The architect has sacrificed the regularity of the edifice to its mystical signification, the inclination in question being designed to represent the position of the head of Christ, drooping upon his right shoulder, the attitude in which He is usually placed upon the cross. The church is filled with images and ornaments of all kinds; in one place our Saviour is represented in the tomb—an image the size of life, the head placed on a pillow, and the body covered with a damask spread, heavily embroidered with gold and silver. Hardly suggestive, this, of the simple winding sheet and the head "bound about with a napkin." Images of the Virgin and of various Saints abound, and absorb so large a share of the devotions of the pious Catholics whom we find in the churches at all hours of the day, that I fancy only a very small fraction can be left for Him whom we are taught to regard as the *jealous* God who will not suffer a rival in the hearts of his creatures.

In front of the high altar was a coffin, or rather an imitation of one, elevated about four feet from the ground, and covered with a pall that swept the pavement. At each corner was a wax taper about a yard in height, and the centre of the pall was ornamented with an immense cross in golden damask. This apparatus indicates that masses are being sung and prayers recited at a stated hour every day, for the benefit of some person deceased. The length of time during which this ceremony is continued depends on the amount of pecuniary means possessed by the friends of the departed, or left by will for this purpose. The coffin of a wealthy person is usually exposed in this way during six weeks, while three or four days must suffice for an individual of more limited ability. The bodies of the dead are carried to the church before burial, and those of the rich remain there while three masses are chanted. This service costs not less than *one hundred dollars*, and subsequent masses during the six weeks that follow, are paid for at the rate of a franc and a half for each mass. Miss W., who accompanied me in my visit to the church, and explained these points, *naively* remarked:—"It costs terribly dear to die in Tirlemont, I should not like to die here!" When the deceased person is a young, unmarried girl, the pall, instead of being black, as in this instance, is white; the tapers are ornamented with blue trimmings, and a crown is placed upon the coffin. These distinctions indicate the peculiar dignity and purity which the Catholic religion attributes to the state of virginity.

While we were busy examining the church, a party entered, bringing a child for baptism, and I was very glad to have an opportunity of witnessing this ceremony. The party was composed of the father of the child, the god-father and god-mother, and the nurse, who carried the infant. They entered at a side door, and, after advancing a few steps, stopped short in front of the recess containing the baptismal font which is always placed in the lower part of Catholic churches, as far removed as possible from the grand altar. You must know, Katey, that an infant, before baptism, is considered a child of Satan, not only figuratively, but literally, so that he cannot enter the body of the church or even the baptistry until the *devil has been expelled!* For this reason baptismal parties slip in at a side entrance in the back part of the church, and wait near the door for the exorcising process to be performed. The attendant in waiting, provided the god-parents with chairs in which they knelt with their faces towards the high altar, and soon a priest made his appearance, advancing towards them from the upper part of the church. He had a surplice and stole over the ordinary black robes worn by the priests in the streets. The former is a kind of white muslin sack, reaching nearly to the knees, and trimmed round the bottom with lace, while the stole is a scarf ornamented with a cross at each end. The nurse placed the infant in the arms of the god-mother, who maintained her kneeling attitude, and the priest on his approach, addressed to her the following question,—"What do you desire for this child?" "That he may be made a child of God," was the reply; and then the priest began the Latin service, which he read in a low, indistinct voice from a book which he held in his hand. Presently he stooped down and blew upon the child, then continued his reading, and after a short interval repeated the blowing process. This was done three times, the mumbling incantations being continued all the while; a pinch of salt was forced into the child's mouth, the sign of the cross was made and other manipulations performed, till finally the devil was supposed to have taken his departure, a fact announced by the priests gathering up the two ends of the stole and laying them upon the child, while at the same time he read a short extract from one of the Gospels. This part of the ceremony would have suited me very well, if it had been in a language intelligible to the persons listening, but like the rest of the service it was in Latin; and I fear the audience were not particularly edified. As the devil was now expelled, the party retired into the baptistry, a small enclosure containing the baptismal font, and, as Bunyan says, "I saw them no more;" but Miss W., who has already performed the office of god-mother, described to me the remainder of the ceremony.

☞ After entering the baptistry, the god-parents are questioned with regard to their knowledge and belief of the principles of the Catholic religion, and they take upon themselves in behalf of the child, the "vows of baptism," which are quite similar to those used in the Episcopal service. The priest then dips up water in the hollow of his hand, from the baptismal font, and gives the child's head a pretty liberal ablution, after which he anoints him with holy oil upon the temples, behind the ears, on the breast, the hands and the feet.—The sign of the cross is made upon him, and the priest pronounces him "a little Christian." At the end of the ceremony the names, age and residence of the parents and god-parents, and the precise hour and moment at which the child was born, are registered in a book kept for the purpose; the god-mother gives a fee, usually from twenty to thirty francs to the officiating priest, and then the child is borne in state through the body of the church and out at the principal entrance. If the child is of wealthy or distinguished parentage, it is customary to distribute money to the crowd which is collected at the door on such occasions.—This expense, as well as the fee to the priest, is borne by the god-parents. Immediately after the baptism a sumptuous entertainment is served up at the house of the father, where the god-parents preside, and drink champagne in honor of the unconscious infant, who has just been so summarily rescued from the power of the devil, and, according to the teachings of the church, made the child of God.

No more time is allowed to elapse between the birth of the child and the baptism than is necessary to complete the arrangements for this ceremony. The child is frequently, perhaps usually, baptized within two or three hours after birth, while sometimes, when the god-parents selected for the occasion reside at a distance, a delay of two or three days is necessary. Catholics believe that all infants who die without having received baptism, spend their eternity in a place which they call Limbo, a half-way station between heaven and hell, whose inhabitants do not suffer the torments of the lost, but are not allowed to participate in the happiness of the blest. To preserve souls from this fate, all good Catholics are authorized to baptize when circumstances demand it, by simply pouring water upon the head of the child, and repeating a short formula. Infants are usually baptized in this way as soon as born, for fear that they may die before they can be taken to the church. This informal baptism does not obviate the necessity of having the ceremony repeated as soon as convenient at the church, but if any accident occurs to the child in the mean time, it ensures him Christian burial, and according to their belief, happiness in a future state of being. Unbaptized infants are buried at night, in a corner of the cemetery, without any religious ceremony.

Well, Katey, by this time you must think I am determined to give you a course of lectures on Catholic theology. I beg your pardon if I have wearied you with my prosings, and my only excuse is that in this, the most intensely Catholic country in Europe, with the exception of Italy, the character and manners of the people are so closely interwoven with their religion that it is impossible to speak of one subject without touching more or less upon the other. But to-morrow we go to Brussels, and I shall probably find something else to write about in my next letter. Your affectionate Minnie.

MOORE'S RURAL NEW-YORKER

ROCHESTER, JUNE 3, 1854.

SPECIAL NOTICES.

☞ *A new quarter commenced April 8,—a good time for new single and club subscriptions to begin; and the renewal of expiring subscriptions is now in order.*

☞ *Additions to Clubs are still in order. If back numbers are not wanted, we will send from 1st March or April to end of year for $1—and count on premium.*

☞ *During the season of navigation we can send the Rural to Canada West free of American postage, and hence will furnish clubs for six months from date at lowest rates.*

☞ *Back numbers of the present volume furnished if desired, or subscriptions may commence at any time.*

Practical Workings of the Slave Law.

A GREAT excitement was created at Syracuse last week Friday, in consequence of a telegraph despatch received by Messrs. COBB and WHEATON, stating that a fugitive slave in charge of the U. S. Marshal, on his way to the South, would arrive in the 6½ o'clock train. The bells rung, and a crowd of two thousand persons assembled on the approach of the train; which, on coming to a stand, was taken possession of by the crowd, but no marshal or fugitive found on board.

Three colored men named STEPHEN, ROBERT, and JAMES PEMBROKE, were arrested as fugitive slaves in New York city, on Thursday, May 25th. The first was claimed as "owing service and labor" to one DAVID SMITH, and the other two to JACOB H. GROVE, both of Sharpsburg, Washington Co., Maryland. A hurried hearing was had before Commissioner MORTON, during which the colored men admitted themselves to be the slaves of the claimants. They were therefore remanded to the owners and taken out of the State before news of the arrest was widely circulated, or demonstrations made for a rescue, which would probably have otherwise been done. The fugitives were forwarded hand-cuffed to Maryland on Friday, from whence a telegraph despatch announces that the chattels arrived in safety.

But the saddest chapter in the history of the law is yet to be told. A fugitive slave named BURNS was arrested in Boston, and had an examination before Commissioner LORING, on Friday, which hearing was adjourned over until next day. In the evening an immense meeting assembled at Faneuil Hall, and was addressed by WENDELL PHILLIPS, THEODORE PARKER, and F. W. BIRD, who counseled open resistance to the enforcement of the fugitive slave law.—About nine o'clock in the evening word came to the hall, that a crowd of negroes were collected in Court Square, and were about to attack the Court House, in one of the upper rooms of which BURNS was confined. This announcement caused the immediate rush of 2,000 to 3,000 excited people to the Court House Square. An attempt was at once made to break open the Court House door on the east side, which, owing to the strong fastenings, failed.

The leading rioters then went to the west entrance, and with a heavy plank, used as a battering engine, store through the panels of the door, and broke some windows. Numerous pistols were fired, and in the melee JAS. BATCHELDER, the deputy marshal, was shot dead. The Centre Watch-House being in the immediate vicinity, a posse of determined watchmen dashed in, and succeeded in arresting eight or ten of the leading rioters, after a desperate conflict.

On Saturday morning the hearing was resumed, a large crowd in the mean time having assembled in Court Square. Two companies of United States troops, and two of the city companies were called out to guard the Court House, and prevent a rescue of the prisoner. The Mayor of the city read the riot act to the crowd and commanded them to disperse, and several arrests were made by the police. After an exciting session of the Commissioner's Court, the hearing was again further adjourned to Monday. A telegraph despatch was received from the war department, at Washington, directing the authorities to call out the troops stationed at Newport if necessary, to sustain the Federal law.

The examination was continued on Monday, the conclusion of which has not come to hand. It is stated, however, that BURNS is no doubt the slave of Col. SUTTLE, the claimant, and will be returned to him. Troops continued to occupy the Court House during the examination, and a telegraph despatch was received from the President, directing the Marshal to enforce the laws at all hazards. There is no abatement of the excitement, and great numbers are flocking into the city from adjoining towns.

Reaping Machine Decision.

IT will be recollected by most of our agricultural readers, that MCCORMICK sued SEYMOUR & MORGAN, of Brockport, for violating his patent on the reaping machine, and recovered against them a judgment for damages to the amount of $20,000. The case was carried up by the defendants to the Supreme Court of the United States, by whom the decision has been reversed on the following grounds—1st: That where a patent is for *a part* of a machine, the rest of the machine being public property, the patentee is entitled to recover damages only for the value of that part, and not for the value of the entire machine embracing that part; and 2d: That where a defendant infringes a patent by making and selling the patented thing, the patentee is entitled to recover as damages, not the profits of manufactering the patent thing, but only the patent fee for it.

The Eclipse.

THE solar eclipse on the 26th ult., was witnessed in the most satisfactory manner, by the citizens of this city and its vicinity. On Wednesday night, two days previous to the appearance of the celestial phenomenon, it rained quite hard, and continued cloudy through much of the day, Thursday. Towards evening, however, it cleared away, and the sun set in a cloudless sky. The rain had settled the dust and cleared the atmosphere of all obscuring vapors, so that the sun arose on Friday morning without a cloud to be seen in any direction above the horizon, and not even a wreath of mist appeared throughout the entire day. As the time approached which the Astronomers had foretold would place the sun, the moon, and the earth, in a straight line, many a curious eye was turned in the direction of the god of day, but shielded from the fierce blaze of his unclouded rays by a smoked glass. A few minutes past four the edge of a dark disk was seen to slide over the western side of the luminary, keeping a little northward of a central direction, until it covered nearly eleven-twelfths of the entire surface, but leaving a magnificent crescent of unlimmed light on the sun's southern limb. The light gradually diminished up to the time of greatest obscuration, having all the appearance on the earth's surface of a near approach to sunset, except an absence of the lengthened shadows. A robin sat upon a tree caroling his evening lay, close by the spot where the writer stood, and he seemed somewhat astonished to see the sun reappearing in full blaze; so making short work of the closing measure of his strain, he flew away, under the idea, no doubt, that he had mistaken the time of day.

Many people were a little disappointed that the darkness was not more manifest, and could not have been made to believe, unless they had seen it, that one-twelfth of the sun's face in a cloudless sky, could give such an amount of light. Such a phenomenon as we witnessed last week, will not occur again for many years, and most of us can truly say, that

"Taken all in all,
We ne'er shall look upon its like again!"

Powder Explosions and Loss of Life.

Two more powder mills have been blown up within a few days, involving a sad loss of human life. On Thursday morning of last week the powder mills of Messrs. LOFFIN & SMITH, located about three miles from Saugerties, Ulster Co., N. Y., blew up, killing seven men, and blowing six houses in the vicinity all to pieces. The buildings were of no great value. The principal loss will be from the destruction of stock and interruption of the works. The latter loss will be pretty serious, as this is the largest mill in the State, and next to the largest in the United States. These mills have been destroyed by explosion five or six times before, but never with such fatal consequences as the last.

The powder mill of Messrs. HAMMER & FONDES, situated at East Hartford, Connecticut, exploded on Friday morning, May 26th. Two men were killed by the accident.

Powder manufacture is at all times, and under all circumstances, an extra hazardous employment, and the workmen stand every moment upon the brink of precipices; but at these times of warlike preparation, the demand for powder prompts the cupidity of manufacturers to go beyond the limits of common safety even of a powder mill; and in the drying process a degree of heat is employed that would endanger the combustion of less explosive materials than gunpowder. There have been, including these, four similar casualties within a few months.

A Heroine.

A FEW days ago a woman named HORTON, living on the line of the Erie railroad, a few miles west of Owego, saw a large pine tree fall directly across the track, at a short curve in the road. She instantly laid down a small child and called her husband, who was at work a short distance away, in a neighboring field. They both ran to the track he taking an axe, but the tree was not less than two feet through, and the time of a passing train near at hand.

The man then took off a pair of red woolen drawers, tore them in two, and he with one part went up the track, while his wife went in the opposite direction, each waving the red signal as a token of danger. In a few minutes the mail passenger train approached at full speed, when it was arrested by Mrs. HORTON standing on the track, waving the leg of the red flannel drawers on a mullen stalk, who by her presence of mind undoubtedly prevented a casualty.—Such a woman deserves a pension in addition to "honorable mention."

BANK ROBBERY.—On Wednesday, the 24th, some bold rascal entered the office of the Canal Bank, Cleveland, and abstracted from a pile containing $20,000 near one-fourth part of the amount. The successful rogue reached around from the front of the counter, in order to get at the funds, and there is no suspicion who the thief is. A reward of one thousand dollars has been offered for the return of the money and thief, or five hundred dollars for either alone, and a proportionate amount of any part of the money. The bank officers expect to recover the funds—when they find them.

☞ A man named Gongle Negus, Weigh Clerk in the U. S. Mint, robbed several depositors to the amount of $100,000, and when accused of the crime, restored the amount and sailed for Europe in the Washington.

Our Albany Correspondence.

ALBANY, May 29th, 1854.

"THINGS is working." It is the prevailing opinion here, that the time has arrived to organize the party of *Freedom*. The issue is forced upon us by the South, and must be met. There will be no further tampering or truckling to the slave power. Laws will not be violently trampled upon, but an organization effected that will look to the repeal of every statute against Freedom, within the jurisdiction of Congress, and which can be effected by *freemen's votes*. Such is the aspect of things at present, and every day gives strength to the opinion.

Albanians are somewhat excited about the celebrated murder case in Troy, by Mrs. ROBINSON, as is charged. Her trial came to a close Saturday, and the verdict of "Guilty" was rendered. This morning the sentence was postponed, and the probability is that we shall have a repetition of the HENDRICKSON case. I am glad that there is one paper, the RURAL, that is sustained without devoting its main space to the awful details of crime. In this latitude, special reporters are sent, and broadsides of daily and weekly issues are filled with them.

Political matters in general are quiet. The extension of the Capitol is soon to be commenced. Also, the enlargements and reconstruction of the old State House, known now as the Geological and Agricultural Rooms of the State.—The Albany and Susquehanna Railroad Company have had some difficulty with regard to their stock subscribers, who refused to pay.—The decision is in favor of the Company, and the probability is, that the extensive section from Albany to Binghamton, will soon be opened to the world. Railroads are certainly important institutions.

The Rev. Dr. HAGUE is giving a series of discourses on domestic life, which are of great utility. In speaking of parents, last Sabbath, he used the text, "Train up a child in the way he should go, and when he is old, he will not depart from it." This subject was handled in a practical manner, inculcating doctrines of education seldom heard in the pulpit, but often found in the columns of the people's paper, the RURAL. But you will accuse me of flattery if I speak my mind further. *OWE*.

Notes from Saratoga.

A TRIP to any part of God's country, at this season, cannot fail to be a treat to any one in whom there remains a spark of nature. Saratoga, in spite of sand and stones, is getting to be very sprucely dressed in beautiful and fragrant green. The winter, though long prolonged, was not severe, and the scanty supply of fodder was eked out in a full sufficiency, there being now a plenty for sale at moderate prices. The long and drenching rains this spring, have put back the work of the farmer to a very late period.—Many fields of corn and potatoes are yet to be planted, at this writing, (May 27.) But every thing now grows as if by magic. Grass is extra. I am told that cattle never did better than they have since put to grass this spring. This has reduced the price of butter very much. At the Springs the reduction is from 23 to about 17 cts. for cash trades. Grain is winter-killed to an alarming extent. I saw several fields of rye and wheat into which cattle had been turned on this account.

The people of this county rely very much on the summer market at Saratoga Springs. Hence they deal in little things much more than the farmers of the middle and western counties.—Their dairies are on a very small scale, some keeping five, some ten, and others perhaps as high as twenty cows. This, of course, prevents the realization of the full profits of dairying as a business. They deal in stock extensively for the beef market; and veal, lambs, and poultry constitute their important staples. Eggs, vegetables, and a few sage cheeses fill up their calendar. Teaming is one of their important occupations. The extensive country north, into which no Railroad or Canal penetrates, must be supplied with even food by land carriage. But the Saratoga and Sacketts Harbor Railroad, now in progress, will make a revolution amongst them, which will be largely in their favor.

Saratoga Springs begins to brighten up. The large hotels are going through with thorough repairs, including a nice coat of paint. Union Hall is already open. The United States and others will soon follow suit. This village consists of about 5,000 permanent inhabitants.—There is very little done in the way of manufacturing, from the want of water power or other facilities. There is a small inland mercantile trade, consisting principally of barter; but the main strength and capital of the place is employed in watering and waiting upon visitors. The principal improvements in building the present season, consist of private houses, intended for boarding and leasing to private families. I am told that the leasing of houses by families is becoming more and more common every year. Saratoga is now easy of access by Railroad from Troy, Schenectady and Albany on the South, and Rutland, Lake George, &c., on the North. Though it is easy to get there, it requires dimes in abundance to *stay!* Some of the Hotels will probably charge four dollars per day.—How true it is that "a fool and his money are soon parted." *OWE*.

☞ Wednesday, the 31st inst., was appointed in New Brunswick, as a day for humiliation and prayer for the success of British arms in the Eastern war. Contributions were to be taken up for the wives and children of soldiers who may fall in battle.

Congressional.

WASHINGTON, May 22d.—SENATE—Mr. Smith presented resolutions of the Legislature of Connecticut on the subject of the Nebraska bill, and against the repeal of the Missouri Compromise.

Mr. Chase gave notice of a bill to abolish the franking privilege, and to provide for the distribution of documents.

Mr. Clayton offered a resolution directing the Committee on Foreign relations to enquire into the expediency of restricting the powers of American Consuls in the Spanish Island, so as to prevent their protecting American vessels engaged in the African slave trade.

HOUSE—The final passage of the Nebraska bill was under consideration until 11½ o'clock P. M., at which time it passed, and the House adjourned.

May 23d.—SENATE—Mr. Mason introduced a resolution calling upon the President to send to the Senate such copies of whatever correspondence had been had with this Government in relation to the slave trade in Cuba.

Mr. Stuart, of Mich., reported a bill to extend the patent of Samuel Colt, the well known manufacturer of revolvers.

Mr. Rush reported the House bill regulating the pay of Deputy Postmasters. The bill was amended and passed. The Nebraska bill as received from the House, was then read once. Mr. Sumner objected to a second reading.

Mr. Douglas submitted a resolution of inquiry, relative to the expediency of recognizing the Independence of Dominica, and opening with the Republic Diplomatic relations. Laid over.

The Indian Appropriation bill was resumed.

Mr. Giddings, of Ohio, asked permission of the House to introduce a motion, the object of which was the printing of 5,000 copies of the proceedings yesterday upon the Nebraska bill. He said it was important that these proceedings should be sent as early as possible throughout the country, and it was desirable, therefore, that the printing be immediately ordered. Objections were made, and the permission refused.

The House then went into committee and took up for consideration the amendment adopted by the Senate to the Deficiency Appropriation bill.

May 24th.—SENATE—Mr. Seward, of N. Y., presented a number of petitions in opposition to the Nebraska bill.

Mr. Benjamin, of La., introduced a series of resolutions passed at the recent session of the Legislature of that State, relative to the annexation of Cuba to the United States. A debate ensued, after which the Nebraska bill, as coming back from the House, was read a second time.

HOUSE—The House went into Committee and took up the Pacific Railroad bill. It was, however, laid over till to-morrow, and the consideration of the Deficiency bill resumed. The amendment appropriating a sum for the Washington Water Works was debated.

May 25th.—SENATE—After the report of several bills, the consideration of the Nebraska bill was resumed. After an exciting sessions of thirteen hours the bill passed the Senate at half past one o'clock A. M., by a vote of 35 to 13.

HOUSE—The House went into Committee of the Whole, and on motion, set aside the Pacific Railroad bill, and resumed discussion on amendments to the Deficiency bill. After disagreeing to the amendment of the Senate for the completion of the Custom Houses and Marine Hospitals, the Committee rose and reported to the House, when an adjournment was carried.

May 26th.—Senate not in session.

HOUSE—Mr. Lancaster introduced bills to establish the office of Surveyor General of Washington Territory, and for the construction of military roads in that Territory. The House then took up for action, in Committee, the Senate's amendments to the Deficiency bill.

LORD MALMESBURY said in the House of Peers, "posterity, in his opinion, was even more interested than those now living in the issue of the struggle, and believing, as he did, that the whole empire of Europe would belong and must belong to the Russian prince, who was enabled to obtain possession of Constantinople, and hold it, he could not but believe that it was necessary for England to spend both blood and treasure, even to the last soldier and the last shilling, in its defence."

☞ Mr. Edwards, President of the Honduras Railroad Company, has arrived at Mobile, and reports that the Congress has ratified the contract granting to the company two and a half million acres of land, to aid in the construction of the road.

☞ Thomas Murray, mate of the schooner Ellen Barnes, of Waeham, Mass., and a negro sailor belonging to the same, have been arrested and committed to jail at Norfolk, Va., for trial on a charge of aiding in the escape of slaves.

☞ F. M. Marion, who ascended in a balloon from Fairmount, Philadelphia, on Monday week, made a safe descent at Pea Shore, having travelled 12 miles in about 25 minutes, notwithstanding the calm that prevailed.

☞ The *Louth* (Ireland) *Advertiser* states, that Admiral Hamelin, commander-in-chief of the French expeditionary fleet engaged in the eastern war, is an Irishman by birth, and a native of the county Louth.

☞ The Senate Committee on Foreign Affairs, which has Mr. Slidell's bill under consideration, are divided and opposed to Fillibustering, and do not recommend giving the war power to the President.

☞ There is a gentleman named Stanford now living at the age of 88 years, who distinctly remembers hearing the first volley fired in the Revolutionary war, at Lexington, on the 19th of April, 1775.

☞ Over 3,000 head of cattle have been driven from the counties of Crawford, Sebastian, and Scott, Arkansas, this season, for California; as also large droves from other frontier counties and the Cherokee nation.

News Brevities.

—The vine disease has appeared in Madeira.

—There have been several decided and fatal cases of Cholera in Providence, R. I.

—The Emperor Napoleon III. completed the 46th year of his age on the 20th ult.

—The weather in April was as cold in England as in this part of our own country.

—The Great Western Railroad now makes the trip from the Falls to Detroit in eight hours.

—Ex-President Fillmore returned home on the 21st of May, after an absence of some two months.

—Count Medem is the new Russian Minister to this country, in place of M. Bodisco, deceased.

—The Troy Budget notices the arrest of D. D. Sheldon, a boy of fifteen, for firing a barn in that city.

—The Women's State Temperance Convention is to be held in Syracuse on the 7th and 8th days of June.

—Marshall Paskiewitsch, the Commander-in-Chief of the Russian Army, is a veteran of seventy years.

—Five colored men were drowned the 23d of May, while on an excursion from Philadelphia to Burlington.

—Large strawberries, of fine flavor, were selling in Cincinnati market on Monday week, at twenty-five cents a quart.

—The annual meeting of the Connecticut Newspaper Association, will be held at Bridgeport on Wednesday, June 7th.

—The Democratic State Convention for the nomination of a Governor in New Hampshire, is called for the 15th of June.

—Drs. Early, of Va., Price, of Georgia, and Kavanaugh, of Ky., have been elected Bishops of the Methodist Church, South.

—The Niagara Falls Suspension Bridge will be ready for the cars early in the autumn. It will be a magnificent structure.

—Mr. Winslow, bearer of dispatches from Mr. Soule, arrived at Washington May 25d, and had an interview with Mr. Marcy.

—The fare to San Francisco by the North Star has been reduced, for cabin passage, from $150 to $100; steerage from $75 to $50.

—Cotton growing in Australia has been successfully tried. One planter reports a profit of over $10 from the product of five acres.

—The Boston Pilot states that Dr. Brownson has declined the chair in the new Irish University, proffered by the Rev. Dr. Newman.

—The Rev. Antoinette L. Brown, owing to previous engagements, has declined accepting a call by the Free Church of Cazenovia, N. Y.

—Within a short time immense quantities of precious stones, sent from Constantinople to be converted into cash, have arrived in Paris.

—The sum raised in England, and placed in Mrs. Stowe's hands, for the promotion of the anti-slavery cause in the United States, is £1,800.

—The Rev. Robert Newton, the celebrated English Methodist divine, is dead. It will be recollected that he visited this country in 1840.

—The Press of the country, North and South, is nearly unanimous against the suspension of our neutrality laws in reference to Cuba.

—It is stated that Capt. Fitch is about to retire from the command of the Washington, and is to be succeeded by Capt. Lines, of the Humboldt.

—The Evening Express train from Detroit, on the Michigan Central railroad, ran over an ox, May 24th, causing the train to upset, killing four persons.

—The "Jerry Rescue" trials are set down for June, at Canandaigua; but they are likely to be postponed on account of the illness of District Attorney Garrin.

—The Democratic Committee of Suffolk County, Mass., after considerable discussion, have adopted a resolution endorsing the Nebraska bill; yeas 37, nays 8.

—Havana has been selected by the Commissioners appointed to designate the county seat for the new county of Schuyler, lately erected in this State.

—The first of the line of steamers to run between New York and Genoa, was to leave the latter port on the 28th inst. She is a 1200 ton ship, built at Glasgow.

—The remains of John Howard Payne, the author of "Sweet Home," are to be removed to the Congressional burying ground, at the expense of the government.

—The Washington Star says, that according to the Post Office regulations the mailing postmaster must in all cases cancel the stamps of pre-payment on letters.

—Such has been the drain upon the fish in the streams in California, that they are already so scarce that petitions are before the Legislature to prohibit fishing with nets.

—A sufficient supply of coal can be obtained from a mine at Ezakli, on the southern coast of the Euxine, for the use of the English and French steam navy in that sea.

—Late advices received from Central America, report that the city of San Salvador has been entirely destroyed by an earthquake, and 500 persons buried under the ruins.

—The clipper ship Golden Fleece, recently wrecked near San Francisco, was owned in Boston, and was insured for a large amount. She was only two years old, and valued at $80,000.

—The Grand Rapids, Mich., Inquirer, estimates the export of lumber from Grand and Muskegon rivers, the coming season, at 100,000,000 feet, worth about one million of dollars.

—"Not a single Jew requiring temporary relief," is the report of the Missionaries and Colporteurs appointed by the New York Society for Ameliorating the Condition of the Jews.

—Government is expending $5,000 in transplanting salt-grass on the shores of Cape Cod. It is thought that the grass will prevent the shifting of the beach sands by the action of the waves.

—The Newark Cricket Club opened the season on Monday week, with a match between the married and single men of the Club, which was won by the latter, with nineteen runs to spare—thus reversing the decision of last year.

Literary Notices.

MOURNING STARS OF THE NEW WORLD.—The above is the title of a collection of biographical sketches of distinguished men, connected with the discovery and early settlement of America, among which are Columbus, Americus Vespucius, De Soto, Raleigh, Hudson, &c. The authoress, Miss H. F. PARKER, writes in a pleasing, somewhat florid style, and has made a very readable book, especially for the young. Published by J. C. DERBY, New York, and for sale by DARROW BROTHERS of this city.

DEWEY has for sale the June number of *Godey's Lady's Book*, elegantly illustrated and printed, as usual. Also, the May number of that sterling old Scotch review, *Blackwood's Magazine*.

GRAHAM'S MAGAZINE, for June, has been received from the publishers. It falls not a whit behind its usual high position in contents and illustrations.

THE KNICKERBOCKER MAGAZINE is always a welcome visitor to our table. The June number has been received, and is for sale by McMANUS.

Foreign Intelligence.

Arrival of the America.

THE steamer America, Capt. Lang, from Liverpool on the 13th, arrived at Halifax May 24th.

The Collins ship Arctic arrived at Liverpool on Wednesday evening, the 10th.

Negotiations for an alliance, offensive and defensive, between Sweden and the Allied Powers, are said to have progressed so favorably that they are on the point of being concluded. It is confidently stated in Paris that Spain, Portugal, and Piedmont, are willing to join the western powers, and if necessary to supply a contingent force. Hanover declared against letters of marque, and the Paris Moniteur announces that Austria is about to do likewise.

Fourteen Russian merchantmen have been captured in the Black Sea. Admiral Dundas has proposed an exchange of prisoners.

A new French loan of 250,000 francs, is talked of. The inhabitants of Odessa are beginning to return to the town, and places of business are opening again. The Banks have removed some distance from the town. England and France were still carrying on their warlike preparations on the most gigantic scale, and a further increase in the armies of both countries was talked of.—Turkey and Russia are also engaged in strengthening their positions. The position of Austria remained neutral.

The English accounts report the force which attacked Odessa as consisting of the English steamers Samson, Terrible, Tiger, Retribution, Furious; French steamers Magadore, Vauban, Bessaltis and Catori, also detachments of English rocket boats. The mode of attack was: The steamers continued for twelve hours to sail round in a cruise of half a mile in diameter, and each steamer delivering fire as it passed—the rocket boats continued to throw twenty-four pound rockets, to set the town and shipping on fire. The steamers also threw red hot shot. The Russians fought with extreme bravery, replying to the fire of the ships. Towards night, the battery becoming untenable, its fire became slower but regular, and at length, the shipping in the rear being on fire, it was silenced. During the action, red hot shot from the steamer Terrible blew up two Russian Magazines on the Imperial mole, and silenced a formidable battery. The American frigate in the harbor took fire and burned to the water's edge, together with twelve other vessels and two ships of war. The rockets also set the lower part of the city on fire, and it burned for two days. Three of the attacking steamers were disabled, and the Vauban was set on fire, but it was extinguished.

The British estimate their loss at less than 20 killed and wounded. The Russians estimate their loss at 20 killed and 60 wounded.

It was reported that for the present the Admirals had abandoned the intention of attacking Sebastopol.

The report of the ship Bahlaur, as to the steamship seen on the 21st of April, received by the Franklin, is repeated, but with this important addition;—"The steamer was headed north, but altered her course toward the Bahlaur, and immediately disappeared. The Baldaur steered to the spot, and saw large quantities of biscuit and boxes. When the steamer was first seen, a barque was alongside of her; but the latter steered away south, and as no one was seen on board the steamer, it is surmised that the barque may have saved the passengers.

California News.

Arrival of the United States.

THE steamer United States arrived at New Orleans, May 22d, with two weeks later news from San Francisco. She has 100 passengers and a small amount of gold. The United States performed the quickest trip from Aspinwall ever known.

Five troops taken from Norfolk by the Illinois were safely landed at Obispo, and all in good health.

The clipper ship Golden Fleece, from Boston, was wrecked just as she was leaving the harbor. An explosion occurred on the steamer Gazelle, by which 20 lives were lost.

Arrival of the North Star.

THE North Star reached New York, on the 25th instant.

On the 16th, Col. Fremont arrived from his mid-winter survey of the Central railroad route, in lat. 37°. The reports given by Col. Babbit, of the sufferings and deaths among the party, were much exaggerated. They lost one man only. Col. F. reports the route to be very favorable. He found only 4½ feet of snow in the Chochrkope Main Pass of the Rocky Mountains. He says that from Parowan, the Great Basin, the route cannot follow the west direction, but must turn southward as far as 46 deg. to cross Sierra Nevada, or must go north as far as Nobles Pass to 41 deg.

The wheat crop has attracted much attention. Fears have been expressed that the crop would be much too large for the demand of California, but this is not probable. The number of acres in wheat in the State is estimated to be about 80,000, which at thirty bushels to the acre, would produce one and a half barrels of flour to each person in the State.

There had been four or five days rain during the fortnight, and the miners and farmers are thus well supplied with water. The news from the mines presents little of striking importance, though the season is extremely favorable, and the gold produced is correspondingly large.

The great event of the fortnight has been the trial and conviction of the Mexican Consul for enlisting men for the Mexican army, and the arrest of the French Consul for refusing to appear as a witness. Gen. Wool has commenced publishing his correspondence on the subject.—The sentence of the Consul has been fixed for the 15th. He is held to bail in the sum of $10,000.

Among the marine arrivals have been 4 vessels from Hong Kong, with 2,000 Chinamen.—The first number of a weekly Lithographic Chinese newspaper, called the "Golden Hills' News," made its appearance on the 28th. It is about 16 by 24 inches in size. The Golden Hills is the Chinese name for California.

At the mint, $1,200,000 of dust has been deposited for coin and bars.

Arrival of the Illinois.

THE Illinois with the California mails arrived at New York, May 25th. She brings 600 passengers and $730,116 96 in specie.

The health of the Isthmus was good.

OREGON.—We have dates from Portland to the 22d of April.

The coming election on the question of a State Government, is exciting great interest. Those in favor estimate that the population is 45,000, and the property $10,000,000. The opponents say 30,000 is the limit of the population, and $16,000,000 as the property.

WASHINGTON TERRITORY.—The papers contain reports that rich gold diggings had been found at Steilacum, on Puget Sound, and on the Yakima river, about 150 miles north-east from Puget Sound.

LOWER CALIFORNIA.—Walker's force is reduced to about 30 men, and their acts are described to be as cruel as those of the most hardened pirates. They take property and life without a moment's hesitation. He had crossed the Colorado, but returned, and is again at San Vincent. It is reported that they have all been taken prisoners. They must soon disperse, if they yet remain together. They have reduced a large number of families, some of them once wealthy, to beggars.

☞ In round numbers, it appears that the conveyance alone of every British soldier to the seat of war costs about £100, or rather, to state it more accurately, says the London Times, "we have to pay an average of £101 passage money for every soldier we keep upon the roll of the expeditionary force, including the passage of horses and stores.

☞ Letters received by the America from a leading house in London, mention that just previous to the closing up of the mail, the London Sun had received telegraphic despatches, announcing the capture of Cronstadt by the allied fleet. The loss on both sides was about 3,000 men.

☞ The mails from the south state that the Government train of thirty wagons was attacked by the Indians near El Paso, on the 2d ult., when six men were killed, and the remainder succeeded in escaping. One hundred mules were stolen from the wagons, and goods to the amount of $30,000 were destroyed.

☞ The Jefferson County Democrat announces the failure of Wheeler & Turners, of Watertown—liabilities $300,000. The Democrat says that they have been engaged in buying produce on a large scale, and have thus drawn heavily on the banks in Jefferson and in some other counties.

☞ We learn from the Ogdensborgh Bulletin that the Academy and the Presbyterian and Baptist Churches in Parishville, were destroyed by fire, communicated from the woods, on the 17th ult.

Marriages.

In Le Roy, May 17, by the Rev. I. Farirs, PETER McEWEN, of Rochester, and Miss MARGARET C. McPHERSON, eldest daughter of J. McPherson, of the former place.

Deaths.

In Fenner, N. Y., April 4, 1854, LOUISA, second daughter of the late ANTHONY BARNETT, in her 28th year.

In Clarendon, N. Y., LESLIE, infant son of DANIEL and ELIZABETH HARRIS, aged 7 months.

Commercial.

BUSINESS AND FINANCE.

THERE has been an unprecedented influx of the precious metals since our last financial report, no less than four steamers having arrived bringing freights from our golden sister on the Pacific. The steamer United States arrived at New Orleans last week with a small amount of treasure; and the Northern Light, the North Star, and the Illinois at New York, bringing in the aggregate two and a half millions of gold. A portion of this treasure, or its equivalent heretofore received however has been transshipped to Europe, thus making New York a mere place of stoppage in transitu. The steamers Canada and Atlantic together will sail vessels exported about a million and a half during the week. Still a large balance is left in the country to stimulate internal trade.

The total export of the precious metals thus far for the year has been about $12,000,000.

The coinage at the Mint of the United States and its branches, for four years, ending on the 31st day of December last, is officially reported as follows:

1850	$33,847,838 50
1851	63,382,889 00
1852	67,843,697 50
1853	64,388,587 72
	$219,340,802 72
The amount coined during the first four months of 1854, is stated at	14,032,051 00
Total,	$233,372,913 72

In regard to the condition of the Banks of the State of New York, the *Albany Atlas* says:—"From the statement by the Bank Superintendent, of the condition of the Banks of this State on the 16th of March last, just published, we take the following summary of the items of Capital, Circulation and Deposits, Specie and Cash Items, Public Securities and Private Securities of the Banks of the State of New York:

Capital		$50,782,396
Circulation (old emission)	$ 814,803	
do (registered notes)	82,036,400	
		82,851,203
Deposits		$ 81,140,877
Specie		11,653,778
Cash Items		18,586,335
Public Securities		20,632,640
Private Securities		162,280,983

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE, Rochester, June 1, 1854.

PRICES of leading articles in the markets have varied considerably in both directions. Wheat and Flour are higher, Grasses being very scarce, and Ohio in many cases taking its place. Home-raised wheat is worth in this market $2,28, and flour $10,25@10,50. Corn is quoted at 72@75c. Oats are lower and more plenty, selling wholesale at 50c. per bushel.

Hay in good supply and falling in price. The highest paid to-day is $17,—and $16 may be considered a fair price for first quality.

Butter plenty and selling at a shilling. New cheese 11 cents per lb.

Lambs pelts (spring) two to three shillings.

Rochester Wholesale Prices.

NEW YORK MARKET—May 29.

FLOUR AND MEAL.—The demand for flour continues good, and the market for all descriptions is gradually advancing. Sales at $5,37@5,50 for Black Rock; $5,50@5,75 for common to straight State; and $5,75@6,12 for extension to good Ohio and inland brands. Included in the sales are 1,500 bbls extra Genesee $10@11,75.—Canadian, sales 2,800 bbls at $5,87 for common brands, and $6 for extra. Rye flour scarce and in request at full prices. Sales good, three at $6. Corn Meal plenty and dull at $3,75 for Jersey.

GRAIN.—Common grades of Wheat are in better supply and the market easier, while the finer qualities are in demand at full prices. Sales prime red Southern at $2; common Upper Lake $1,76; red Wabash at $1,95 and prime Genesee at $2,17½. Rye very scarce. Sales at $1,20. Barley nominally the same. There is less corn offered.—Sales at 68@71 for damaged and heated, 72@74 for good to prime Western mixed, 72@73 for Northern yellow, and 72 for white Southern. Oats scarce and in request at better prices. Sales at 51@58 for State. Western very scarce.

PROVISIONS.—Large receipts of pork. Sales Mess at $13,62@13,75, and $12,25@12,50 for Prime. Small sales Clear at $16,25@16,37. In beef a good business doing.—Sales Country Mess $9,75@12,50, repacked Chicago $14,37@14,62, and $7@8,25 for Prime. Lard in good demand at 9@9¾c. Butter 12@16c for Ohio, and 14@20c for State. Cheese plenty and dull at 9@11c.

ALBANY MARKET—May 29.

FLOUR AND MEAL.—State brands are held very firmly, while extra brands of Western are held at an advance of 25c per bbl., with some sales at the improved prices, at $8,25@8,75 for inferior to good State, $8,62@9,25 for common to good Western, $9,00@10,25 for fancy State, $9 75@10,50 for extra Ohio and Michigan, and $10,25@11 for extra Genesee. Rye flour sales at $1,37@1,44 per 100lbs.

GRAIN.—Wheat good while Canadian at 62,97. Corn sales at 72 for Western mixed, and 72½ for round yellow. Oats scarce at 55.

BUFFALO MARKET—May 29.

The market for Flour active, especially for common to choice brands. Sales at $5,56½ for Southern Ohio, and $5,50@5,62½ for good to favorite brands Ohio, Mich. and Indiana.

GRAIN.—In Wheat there was a better demand for prime parcels which are scarce. Sales white Ohio at $2,12½; Chicago mixed $1,60. Corn 60c. Oats 43c.

Canal Freights—12½c on Corn, and 56@57c on flour to New York.

NEW YORK CATTLE MARKET—May 22.

AT Washington Drove Yard—Offered during the week 1,850 Beef Cattle. Prices, &c.—further large advance has taken place in Beef Cattle, owing partly to an actual scarcity, and partly, perhaps, to speculative arrangements on the part of the brokers. We quote:—Beef Cattle $11@13; Cows and Calves $30@40; Veal Calves 4@6½c per lb; Sheep $3@10; Swine (corn fed) $3,00@4,25 per cwt.

At Browning's—Prices at this market show a wide range. Sales at $7,15@10,50 per 100 lbs. for Beeves; Cows and Calves sold at from $30 to 60. Veal sold at from 4 to 6c per lb., live weight. Sheep range at from $3,50 to $7,50. Lambs at $3,50 to $6.

At Chamberlain's—Prices of Beef ranged at from $9 to $11,50 per 100 lbs. Cows and Calves—sales at from $30 to 45. Sheep and Lambs in good demand; washed sold at 4@8c per lb.; sheared 2½@6c. Lambs 3½@5c.

At O'Brien's—Sales of Beeves at $9@12,00. Cows and Calves at from $40 to $50. Veal Calves 4½@6c per lb.

ALBANY CATTLE MARKET—May 29.

AT W. Woolford's Bull's Head, Washington street.—Beef Cattle—300 at market. Prices—Extra $9,00; 1st quality $8,50; 2d do, $8; 3d, $7@7,50.

Advertisements.

GLEN HAVEN.

THIS WATER-CURE takes the first rank of establishments of this kind in the United States. During the past winter there have been from sixty-five to seventy persons in it taking Hydropathic treatment, and at the date of this advertisement there are not less than eighty who come from sixteen different States and Canada.

The Institution is not nearly full, and the proprietors take pleasure in stating that for beauty of location, salubrity of climate, purity of air, softness, purity and abundance of water, Glen Haven is without a rival.

The Physicians; Doctors J. C. & Mrs. L. F. Jackson, and Dr. Harriet N. Austin, are known wherever the Water Cure Journal is read.

Our route is from the east or west on the Central Railroad to the Junction; thence by omnibus to Skaneateles, and up the lake on the steamboat, or by James Tyler's livery. For further particulars apply for Circular. Address, Post-paid, J. C. JACKSON, M. D.

730-4t. Scott, Cortland Co., N. Y.

CHAIN HORSE-POWERS, THRESHERS, &C.

ENDLESS CHAIN HORSE-POWERS, Threshers and Riddles, (lately improved,) made and sold by the subscribers, at Central Bridge, Schoharie Co., N. Y. Warranted to suit. Price, for two horse machines, $165.

One of these machines threshed the wheat allotted it for trial, at the trial of Agricultural Implements, at Geneva, in July, 1852, in less time (and gave a better percentage of clean grain,) than any other machine on the ground, considering the amount of power applied.

230-4teow. G. WESTINGHOUSE & CO.

Pure Bred Fowls and Eggs.—I am prepared to furnish eggs at my store, or packed in boxes and forwarded by Express to any part of the Union with safety.

Prices.—Brahma Pootra, $4 per doz.

White or Buff Shanghai, $3 do. do.

Rochester, N. Y. C. F. CRISSMAN, Seed Store.

230. Nos. 8 and 183 Main St.

The New Hydropathic Family Physician.—A Medical Adviser and Ready Prescriber, with references to the Nature, Causes, Prevention and Treatment of Diseases, Accidents and Casualties of every kind; with a Glossary, Table of Contents, and Index; the whole illustrated with nearly Three Hundred Engravings and colored Frontispieces. By JOEL SHEW, M. D. One large volume of 820 pages, substantially bound in Library style. Published by FOWLERS AND WELLS, 308 Broadway, New York.—The great work contains,

I. Anatomical, Physiological, and Hygienic Dissertations, illustrated with numerous engravings.

II. The Nature of Disease, Physiologically and Pathologically considered; Rules for management in the Sick-room.

III. A Description of the various diseases to which the Human body is subject, with methods of Prevention and Cure, on Hydropathic principles.

IV. Management of Wounds, Hemorrhages, Fractures, Dislocations, Scalds, Burns, Poisoning, and other Physical calamities. Illustrated.

V. The Diseases of Females, with Advice and Directions for Home Treatment concerning Menstruation, Pregnancy, Childbirth, and the management of Infants.

VI. The Water-Cure processes fully illustrated and explained; Temperature of Baths, and the Philosophy of the Action of Water upon the Human System.

VII. The effects of Air, Exercise and Diet, with especial reference to the treatment of chronic diseases.

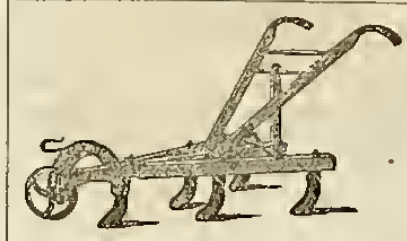
VIII. The Drug-Practice contrasted with Hydropathic and Physiological Treatment.

IX. Hydropathic Establishments; their Location, Formation, and Right Management.

The New Hydropathic Family Physician is the most elaborate and complete popular work on the subject. Every family should have a copy.

Price, delivered free, or with postage prepaid by mail, only $2,50. The amount may be enclosed in a letter, and directed to FOWLERS & WELLS, 308 Broadway, N. Y.

☞ Agents wanted in all the States. 230-2t



CULTIVATORS AND HORSE HOES.

WRIGHT'S double pointed polished steel tooth Corn Cultivators, a large assortment, wholesale and retail.

Also, Horse Hoes, a superior article for cultivating corn, potatoes, &c., at the Old Agricultural Warehouse, Mumford st., near Gas Works. F. D. WRIGHT.

Rochester, May 29, 1854. 230-3t

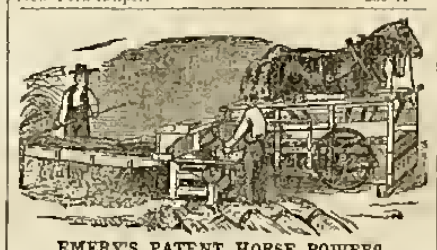
Valuable Farm for Sale, IN LOCKPORT, N. Y., on account of the proprietor's health. About 200 acres, with ample buildings, orchard, &c. Lying just outside the corporation line it offers an excellent investment, as the rapid growth of Lockport (present population 10,000,) rentantly enhances its value. Will be sold together, or in parts, on easy terms. Inquire of E. B. GALUSHA, or O. C. & E. C. WRIGHT, Lockport. 230-4t*

MATRIMONY.

THE Advertiser, a widower, 31 years of age, residing in a Western State, is desirous of forming a matrimonial alliance with a maiden or widow lady, (younger than himself,) possessing a knowledge of domestic affairs.

The Advertiser's circle of friends being very limited, he is compelled to have recourse in an advertisement. Honor and secrecy inviolable. Address, G. C. B., Detroit, Mich.

Ketchum's Mowing Machine.—GEO. W. EMERY, 47 Liberty St., Albany, is Agent for the sale of this Machine for Albany and vicinity. Also Seymour & Morgan's New York Reaper. 230-4t



EMERY'S PATENT HORSE POWERS,

THRESHERS, SEPARATORS, SAWS, &c; together with a full and complete assortment of Agricultural Implements and Machines, Field and Garden Seeds, Fertilizers, &c.

RICH. H. PEASE,

369 and 371 Broadway, Albany, N. Y.

The above Horse Powers, Threshers, &c, may be obtained of E. B. HALLOCK, Rochester, N. Y. 230-8t

3,500 ACRES OF LAND, with Steam Saw Mill, for sale in Scioto Valley, Ohio, and lying on the Ohio Canal. The land will be divided to suit purchasers. For particulars inquire of HOAG & BROWNELL, or H. H. HOAG, Piketon, Pike Co., Ohio, May 31, 1854. 230-3t

BONE DUST.—We can supply a few barrels of genuine coarse bone dust, at $2,50 per barrel.

227 H. C. WHITE & CO., Buffalo Ag'l Warehouse.

IMPORTED HORSE "CONSTERNATION."

THIS well known Thoroughbred Horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of YOUATT.

TERMS—$10 the season, $15 to insure, *payable in advance in all cases.* Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No mare will be served that is either ring-boned, spavined, or blind. J. B. BURNET.

Syracuse, N. Y., May 1, 1854. 226-81w-31m

THE PEOPLE'S PATENT OFFICE.

THIS well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost ability and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with inventors from 9 A. M. to 6 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid, ALFRED E. BEACH,

Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Inventions and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Address as above.

"HALTON" (II,652.)

MY *first premium* Short-horn Bull, HALTON, will serve a few cows this season, at $10 each. Thorough bred Short-horn cows, $20 each; to be paid in advance. Cows not proving in calf, may be returned at any time within four months.

I shall have a few Short-horns for sale this summer, (male and female,) from premium animals. S. P. CHAPMAN.

Mount Pleasant Farm, Clockville, Madison Co., N. Y.

May, 1854. 226-4t-cow*

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

EMERY'S HORSE POWERS, Threshing Machines and Separators, Circular and Crosscut Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use—Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—GRASS, FIELD AND GARDEN SEEDS, of the best imported and Shaker growth.

E. B. HALLOCK.

Warehouse and Sale Rooms No. 24 Exchange Street, Rochester, N. Y. 228-tf

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

THE FACT that the circulation of the W. G. & S. R. has more than *trebled* during the past two years, and is daily increasing, induces us to enlarge an enlargement and improvement, which will at once render the work far more acceptable and valuable, if not indispensable, to all engaged in Wool Growing, the breeding of Improved Stock, or the rearing of Domestic Animals generally. Though our arrangements are not entirely completed, we can safely announce that—

On the commencement of its Sixth Volume, July, 1854, the WOOL GROWER AND STOCK REGISTER will be enlarged to THIRTY TWO PAGES monthly, printed upon new and handsome type, and essentially improved in other respects. The Yearly Volume will comprise 384 octavo pages, or *double* the number contained in the present, (exclusive of the advertising cover, which will probably be omitted.)—This will give ample room for the discussion of many subjects which require attention, but which we can scarcely notice with our present limited space. Among other matters, it proposes to publish Pedigrees of pure bred cattle, horses, sheep, &c., and to give the names, residence, &c., of the principal breeders of improved Stock throughout the country—for the mutual benefit of owners and those desirous of purchasing.

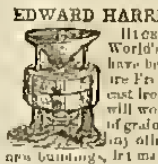
Arrangements are making to improve the *quality*, as well as increase the amount of reading matter. Regarding the reliability and value of its CONTENTS as of far more importance than the size or appearance of the paper, we shall endeavor to secure the assistance, as contributors to its pages, of the best and most experienced writers on the various subjects discussed,—and cordially invite the co-operation of all disposed to aid in enhancing its value and usefulness.

Although we hope to double the *value* of the paper, its subscription price will not be increased—except perhaps to clubs of 20 or over. Single copies will be furnished at Fifty Cents—5 copies for $2, and 8 for $3. ☞ The first five volumes, bound in colored paper, will be sent post-paid, and the numbers of the 6th volume as issued, for $3.

The attention of all interested in the subjects and objects of a Stock Journal, is respectfully solicited. The readers of the RURAL NEW-YORKER are especially invited to give the W. G. & S. R. an examination, and, if approved, their encouragement. Specimen numbers, &c, cheerfully sent, gratis, to all applicants. Address

May, 1854. D. D. T. MOORE, Rochester, N. Y.

EDWARD HARRISON'S PATENT GRIST MILL



HAS RECEIVED the highest premium at the World's Fair; and more than 250 of them have been sold within two years. The stones are French Burr; the frames and hoppers, cast iron; and the spindles, cast steel. They will work both for flouring and on all kinds of grain, and will keep in repair longer than any other mill. Having just completed my new buildings, for manufacturing and running them, I am now prepared to supply all orders for all the sizes, from 20 inches to four feet diameter, including a superior farm and plantation mill, which will grind corn in the best manner, by horse-power, or even by hand. Public attention is solicited to this small mill in particular. Descriptive circulars, with cuts, sent to post-paid applications.

225-1t* EDWARD HARRISON, New Haven, Ct., Sole manufacturer, and Proprietor of the Patent.

KETCHUM'S IMPROVED MOWING MACHINE,

WITH ENTIRE CHANGE OF GEAR, THE ONLY SUCCESSFUL MOWER NOW KNOWN.

Ketchum's *Improved* Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: *durability, convenience and ease of action.* The shafts now have bearings at both ends, which overcomes all cramping and cutting away of boxing. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in grinding at each and every cut, all of them being *on upper side of the frame;* oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c; the finger bar is lined with iron its whole width, which protects it from wear.

These and various other additions for strength, durability, &c; makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

It requires not over ten minutes to get one ready for operation, there being but two bolts, (besides the pole bolts,) to be secured to have one ready for use. They will cut *all kinds of grass*, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair; it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make this machine deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying *untried* Mowers; if they do (as was the case with many last year) they will have no less, vexation and disappointment.

If any parts are wanted to repair any machine we have sold, or may hereafter sell, they will be furnished and only manufacturers' cost for the same be charged.

☞ In all cases where extras are wanted, be sure to give us *the number of your Machine.*

(WARRANTY:) That said machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of any *kind of grass*, and do it as well as is done with a scythe by the best of mowers.

The price of the Mower, with two sets of knives and extras, is $110 cash, in Buffalo, delivered on board of boat or cars free of charge.

Office and Shops, corner of Chicago street and Hamburgh Canal, near the Eastern R. R. Depot, Buffalo, N. Y.

HOWARD & Co., Manufacturers and Proprietors.

The Mower is also manufactured by REGGLES, NORRIS, MASON & Co., at Worcester, Mass., for the New England States.

By SEYMOUR, MORGAN & Co., Brockport, N. Y., for Illinois, Iowa and Michigan.

By WARDER & BROKAW, Springfield, O., for Ohio and Kentucky. 228-4t.

J. HATALTE & Co. are also sole Agents for the sale of Ketchum's Mowing Machine in Rochester, and for the vicinity. 220-1jy m11-3t

LAND PLASTER

AT Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

211-3m. JIREH BOWLEY.

THE HORTICULTURIST.

AND JOURNAL OF RURAL ART AND RURAL TASTE.—The Horticulturist is a Monthly Journal, devoted to Horticulture and its kindred arts, Rural Architecture and Landscape Gardening. It is edited by P. BARRY, late Horticultural Editor of the Genesee Farmer, and author of that popular work, "The Fruit Garden." To those who cultivate Fruit and Flowers, this work is indispensable, as it contains full directions for cultivation, as well as every thing new on the subject, either in this country or in Europe.

The Horticulturist is beautifully printed on fine tinted paper, with costly illustrations on wood and stone. It contains 48 pages, without advertisements, and each number has a full page engraving, on stone, of some rare fruit or flower, drawn from nature, by the best living artist in the line.

TERMS.—Two Dollars Per Annum, In Advance. A discount of twenty-five per cent. allowed to agents. Postmasters and others are invited to act as agents, to whom specimen numbers will be sent, free of postage, on application to JAS. VICK, Jr., Publisher, Rochester, N. Y.

P. S.—A new volume commences on the first of January, January 1, 1854

KETCHUM'S MOWING MACHINE.

THIS machine stands without a successful rival, as the *mowing machine of the age.* The supply will not be equal to the demand. If any person desires one for the coming season, they cannot speak too soon. The uniform price at Buffalo is $110,00. All who will forward us an order accompanied with the cash or satisfactory reference, may depend upon being faithfully served with a machine in good season. H. C. WHITE & CO.,

Buffalo Ag. Warehouse and Seed Store, 11 & 13 West Seneca street, Buffalo, N. Y 211tf.

Poetical.

(Written for Moore's Rural New-Yorker.)

AN EVENING MEDITATION.

BY WM. E. C. KNOWLES.

The shadows of the coming night fall round,
Where shone before the splendors of the day:
And hushed in drowsy quiet is the sound
Of many feet that trod the crowded way.

A lonely night-bird, from some covert spray,
Sparkling with pearl-drops by the evening shower,
Wafts to the list'ning ear her mournful lay,
Adapted well to suit the solemn hour.

A hollow murmur fills the dreamy vale,
Like the faint echo of a distant roar,
When sullen waves, outliving storm and gale,
Weary and restless, sink upon the shore.

And all around, though silently and slow,
The pulses of the universe beat on;
Throbbing responsive to the solemn flow
Of years that bring their seasons—and are gone:

The same deep pulses that with mighty power
Have beat in ev'ry altitude and clime,
Since the first dawning of Creation's hour,
Yet never wearied by the lapse of time.

From out the distant west the ruddy flush
Of sunset slowly fades to russet gray:
Fainter and fainter grows each ling'ring blush,
Till darkness drowns the glory of the day.

And all is still. The rush of busy life
Is heard no more from thoroughfare or grove:
And sleep and silence take the place of strife,
Like noiseless visitors from worlds above.

Fit time is this to muse—to call to mind,
In retrospective view, the scenes of youth;
Which, passing, left their pleasure far behind,
And graver lessons of sublimer truth.

Our early home, within a grassy vale,
Comes up to view with forests rearing near;
And granite hills protecting from the gale
The cherished spot that is to memory dear.

Ah, there the sweets of life were first enjoyed—
Our earliest sports were near the gurgling brook:
The sunshine of those happy days ne'er cloyed,
While on their shadows we ne'er deigned to look.

And in the morning, when the east was red,
We climbed the hills to view the glowing sight;
And saw the sun, from out its golden bed,
Tread up its customary path of light.

And then when came the mellow twilight hour,
And shadows stole to earth—a sable train—
We watched the stars—fair orbs of feeble power—
Come, one by one, and look to earth again.

And when the woods were bathed in Autumn's glow,
In Autumn's sunshine, with her clouds dyed red,
We roamed the hills, and in the vales below,
While fallen leaves were pressed beneath our tread.

Ah, childhood's home! Our spirits often yearn
For purer joys like those of early years;
And often scenes of youthful days return
In manhood dreams, and bathed in bitter tears.

Our thoughts steal often to that peaceful home—
Its hills and forests in our vision rise;
And oft in noon-day reveries, there come
Its prospects, tinged with bright autumnal dyes.

The sterner lessons of maturer life
Have put to flight all visionary schemes;
And stern necessity, and eager strife,
Have stepped between us and our childish dreams.

The higher duties of a higher flight,
Quickened an aspiration then to rise;
And a rough pathway rose before our sight,
In which to walk with willing sacrifice.

And we have toiled nobly, and done our best;
Does God require of erring mortals more?
When this they've done they then can henceforth rest
Within the structure they had reared before.

And like the evening of some wilder day,
A settled calm shall cheer their ling'ring years:
A golden halo, whose remotest ray,
Shall recompense them for their grief and tears.

And this reward, descending to the good,
Creates an aspiration here to rise;
While round our pathway, in serener mood,
Hope spreads her drapery of humbler guise.

Our task seems lighter, and seems less to bear—
The goal is near us, and in glory crowned:
We rise like some majestic bird of air,
Higher and higher, with each ethereal round!

Wilson, N. Y., 1854.

Rural Sketch Book.

DON'T PROPOSE IN THE DARK!

BY MISS MITFORD.

The pretty farm-house standing at the corner where Kibes lane crosses the brook, or the brook crosses Kibes lane, (for the first phrase, although giving by far the closest picture of the place, does, it must be confessed, look rather Irish,) and where the aforesaid brook winds away by the side of another lane, until it spreads into river-like dignity as it meanders through the sunny plain of Hartly Common, and finally disappears amid the green recesses of Perge Wood—that pretty square farm-house, half hidden by the tall elms in the flower court before it, which with spacious garden and orchard behind, and the extensive barns, yards, and out-buildings, so completely occupies one of the angles formed by the crossing of the lane and the stream—that pretty farm-house contains one of the happiest and most prosperous families in Aberleigh—the large and thriving family of farmer Evans.

Whether from skill or good fortune—or, as is most probable, from a lucky mixture of both—everything goes right on his great farm. His crops are the best in the parish; his hay is never spoiled; his cattle never die; his servants never thieve; his children are never ill. He buys cheap, and sells dear: money gathers about him like a snow-ball; and yet, in spite of all this provoking and intolerable prosperity, everybody loves farmer Evans. He is so hospitable, so good-natured, so generous, so homely! There, after all, lies the charm. Riches have not only not *spoiled* the man, but they have not altered him. He is just the same in look, in word, and way, that he was thirty years ago, when he and his wife with two sorry horses, one cow, and three pigs, began the world at Dean Gate, a little bargain of twenty acres, two miles off. Ay, and his wife is the same woman!—the same frugal, tidy, industrious, good-natured Mrs. Evans—so noted for activity of tongue and limb, her good looks, and plain dressing; as frugal, as good-natured, as active, and as plain-dressing Mrs. Evans at forty-five, as she was at nineteen, and, in a different way, almost as good looking.

Their children—six "boys," as former Evans promiscuously calls them, whose ages vary from eight to twenty, and three girls, turn grown up, and one, the youngest of the family—are just what might be expected from parents so simple and good. The young man intelligent and well-conducted; the boys, docile and promising; and the little girl, as pretty a curly-head, rosy-cheeked poppet, as ever was the pet and plaything of a large family. It is, with the eldest daughters that we have to do.

Jane and Patty Evans were so much alike, as hath often befallen any two sisters not born at one time; for, in the matter of twin children, there has been a series of puzzles ever since the days of the Dromios. Nearly of an age—(I believe that at this moment both are turned nineteen, and neither has reached twenty)—exactly of a stature, so high that Frederick the Great would have coveted them for his tall regiment,—with hazle eyes, large mouths, full lips, white teeth, brown hair, and that sort of nose which is neither Grecian, nor Roman nor aquiline, nor *le petit nez retrousse*, that some persons prefer to them all; but a nose which, moderately prominent, and sufficiently well shaped, is yet, as far as I know, anonymous, although it be perhaps as common and as well looking feature as is seen on an English face.

Altogether, they were a pair of tall and comely maidens, and being constantly attired in garments of the same color and fashion, looked at all times so much alike, that no stranger ever dreamed of knowing them apart; and even their acquaintances were rather accustomed to think and speak of them generally as "the Evanses," than as the separate individuals Jane and Patty. Even those who did pretend to distinguish the one from the other, were not exempt from mistakes, which the sisters—Patty especially, who delighted in the fun so often produced by the unusual resemblance—were apt to favor by changing places in a walk, or slipping from one side to the other at a country tea-party, or playing a hundred little innocent tricks to occasion at once a grave blunder and a merry laugh.

Old Dinn Goodwin, for instance—who being rather purblind, was jealous of being suspected of seeing less clearly than her neighbors, and had defied even the Evanses to puzzle her discernment—seeking in vain on Patty's hand the cut finger which she had dressed on Jane's, ascribed the incredible cure to the merits of her own incomparable salve; and could be hardly undeceived, even by the pulling off of Jane's glove and the exhibition of the lacerated digital scarf round by her own bandage. Young George Kaily, the greatest beau in the parish, having betted at a Christmas party that he would dance with every pretty girl in the room, lost his wager (which Patty had overheard,) by that saucy damsel's slipping into her sister's place, and persuading her to join her own unconscious partner; so that George danced twice with Patty, and not at all with Jane.

In short, from their school days, when Jane was chidden for Patty's bad work, and Patty slapped for Jane's bad spinning, down to this their prime of womanhood, there had been no end to the confusion produced by this remarkable instance of family likeness.

And yet Nature—who sets some mark of individuality upon even her meanest productions, making some unnoted difference between the lambs dropped from one ewe, the robins bred in one nest, the flowers growing on one stalk, and the leaves hanging from one tree—had not left these young maidens without one great and permanent distinction—a natural and striking dissimilarity of temper. Equally industrious, affectionate, happy and kind; each was kind, happy, affectionate, and industrious in a different way. Jane was grave, Patty was gay. If you heard a laugh or a song, be sure it was Patty; she who jumped the stile, when her sister opened the gate, was Patty; she who chased the pigs from the garden as merrily as if she was running a race, so that the pigs did not mind her, was Patty.

On the other hand, she that so carefully was making, with its own ravelled threads, an invisible darn in her mother's handkerchief, and bearing her little sister read the while; she that was so patiently feeding, one by one, two broods of young turkeys; she that so pensively was watering her own bed of rare flowers—the pale hues of the Alpine pink, or the alabaster blossoms of the white evening primrose, whose modest flowers, dying off into a blush, resembled her own character—was Jane.

Some of the gossips of Aberleigh used to assert that Jane's sighing over the flowers, as well as the early steadiness of her character, arose from an engagement to my lord's head gardener, an intelligent, sedate and sober young Scotchman. Of this I know nothing. Certain it is, that the prettiest and newest plants were to be found in Jane's little flower border; and if Mr. Archibald Maclane did sometimes come to look after them, I do not see that it is any business of anybody's.

In the meantime, a visitor of a different description arrived at the farm. A cousin of Mrs. Evans had been as successful in trade as her husband had been in agriculture, and he had now sent his only son to become acquainted with his relations, and to spend some weeks in their family.

Charles Foster was a fine young man, whose father was neither more nor less than a linen-draper in a great town; but whose manners, education, mind and character, might have done honor to a far higher station. He was, in a word, one of nature's gentlemen, and in nothing did he more thoroughly show his own taste and good breeding, than by entering entirely into the homely ways and old-fashioned habits of his country cousins. He was delighted with the simplicity, frugality and industry, which blended well with the sterling goodness and genuine prudence of the great English farm-house. The manners especially pleased him much. They formed a strong contrast with anything he had met with before. No finery—no coquetry—no French—no piano! It is impossible to describe the sensation of relief and comfort with which Charles Foster, sick of musical misses, ascertained that the whole dwelling did not contain a single instrument, except the bassoon on which George Evans was wont, every Sunday at church, to exorcise the ears of the whole congregation. He liked both sisters. Jane's softness and considerateness engaged his full esteem; but Patty's innocent playfulness suited best with his own high spirits and animated conversation. He had known them apart, from the first; and indeed denied that the likeness was at all puzzling, or more than is usual between sisters; and secretly thought Patty much prettier than her sister, as she was avowedly merrier. In doors and out, he was constantly at her side; and before he had been a month in the house all the inmates had given Charles Foster as a lover of his young cousin; and she, when rallied on the subject, cried fie! and pish! and pshaw! and wondered how people could talk such nonsense—and liked to have such nonsense talked to her better than anything in the world!

Affairs were in this state when one night Jane appeared even graver and more thoughtful than usual, and far, far sadder. She sighed deeply; and Patty—for the two sisters shared the same little room—inquired tenderly, what ailed her? The inquiry seemed to make Jane worse. She burst into tears, while Patty hung over her and soothed her. At length she roused herself by a strong effort; and, turning away from her affectionate comforter, said in a low tone—

"I have a great vexation to night, Patty. Charles Foster has asked me to marry him!"

"Charles Foster! did you say Charles Foster?" asked poor Patty, trembling, unwilling to trust her own senses against the evidence of her heart; "Charles Foster?"

"Yes, our cousin, Charles Foster!"

"And you have accepted him?" inquired Patty, in a hoarse voice.

"Oh, no—no—no! Do you think I have forgotten poor Archibald? Besides, I am not the person whom he ought to have asked to marry him; false and heartless as he is, I would not be his wife—cruel, unfeeling, unmanly as his conduct has been! No! not if he would make me Queen of England!"

"You refused him, then?"

"No, my father met us suddenly, just as I was recovering from the surprise and indignation that at first struck me dumb. But I shall refuse him most certainly—the false, deceitful, ungrateful villain!"

"Poor father. He will be disappointed. So will mother!"

"They will be disappointed, and both angry—but not at my refusal. Oh, how they will despise him," added Jane.

Poor Patty, melted by her sister's sympathy, and touched by an indignation most unusual in that mild and gentle girl, could no longer command her feelings, but flung herself on the bed, in that agony of passion and grief which the first great sorrow seldom fails to excite in a young heart.

After a while she resumed the conversation.

"We must not blame him too severely.—Perhaps my vanity made me think his attentions meant more than they really did, and you had all taken up the notion. But you must not speak of him so unkindly. He has done nothing but what is natural. You are so much better than I am, my own dear Jane! He laughed and talked with me—but he felt your goodness; and he was right. I was never worthy of him, and you are; and if it were not for Archibald, I should rejoice from the bottom of my heart," continued Patty, sobbing, "if you would accept—," but unable to speak her generous wish, she burst into a fresh flow of tears; and the sisters, mutually and strongly affected, wept in each other's arms, and were comforted.

That night Patty cried herself to sleep; but such sleep is not of long duration. Before dawn she was up, and pacing, with restless irritability, the dewy grass-walks of the garden and orchard. In less than half an hour, a light elastic step—she knew the sound well—came rapping behind her; a hand—oh, how often had she thrilled at the touch of that hand!—tried to draw hers under his own; while a well known voice addressed her in the softest and tenderest accents.

"Patty—my own sweet Patty! have you thought of what I said to you last night?"

"To me?" replied Patty, with bitterness.

"Ay, to be sure—to your own dear self! Do you not remember the question I asked you, when poor good father—for the first time unwelcome—joined us so suddenly, that you had not time to say 'Yes,' now?"

"Mr. Foster!" replied Patty, with some spirit, "you are under a mistake here! It was to Jane that you made the proposal, and you are taking me for her at this very moment!"

"Mistake you for your sister! Propose to Jane! Incredible! Impossible! You are jesting!"

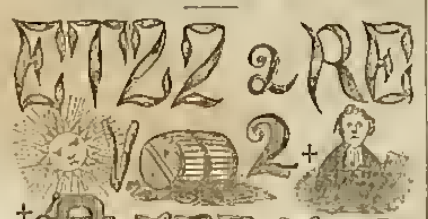
"Then he took Jane for me last night—and he is no deceiver!" thought Patty to herself, as with smiles beaming brightly through her tears, she turned around at his reiterated prayers, and yielded the hand he sought to his pressure.

"He mistook her for me! He that defied us to perplex him!"

And so it was; an unconscious and unobserved change of place, as either sister resumed her station beside little Betty, who had scampered away after a glow-worm, added to the deepening twilight and the lover's natural embarrassment, had produced the confusion which gave poor Patty a night of misery to be compensated by a lifetime of happiness. Jane was almost as glad to lose a lover as her sister was to regain one. Charles is gone home to his father's to make preparations for his bride; Archibald has taken a great nursery garden, and there is some talk in Aberleigh that the marriage of the two sisters is to be celebrated on the same day.

Youth's Corner.

ILLUSTRATED REBUS, NO. 24.



☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 21 letters.

My 12, 4, 7, 13, 5, 4, 21 governs men's actions.

My 5, 11, 2, 13, 6, 8, 12, 4, 7, 13, 17, 12 is a compact.

My 1, 15, 4, 9, is a prohibition.

My 7, 18, 12, 4, 21, 3, 8, 7, 18 is the name of a town in the State of New York.

My 16, 2, 11, 17, 19, 10, 4, 12 attracts the attention of men of taste.

My 14, 5, 8, 12, 9, 11 is the name of a city in the United States.

My 9, 7, 12, 2, 12 is found in a barren waste.

My 20, 6, 7, 13, 14, 21, 10, 1, 2, 20, 20, 15 is the name of the place where this was written.

My whole is a maxim applied to the character of woman.

J. B.

☞ Answer next week.

[For Moore's Rural New-Yorker.]

PROBLEM.—A. and B. dug 100 rods of ditch for $100. A had the hardest end, and his price per rod in proportion to B.'s was as 10 to 6,—How many rods must each dig, and what price per rod, that it may amount to $50 each?

☞ Answer next week.

Answer to Illustrated Rebus No. 22.—"*Always look before you leap.*"

Answer to Geographical Enigma in No. 22.—*Niagara Falls and Suspension Bridge.*

Answer to Question for Boys in No. 22.—4,000,000 *square miles, or* 2,000 *miles on a side.*

Answer to Conundrum in No. 22.—*Ushant, Havre.* (you shan't have her.)

Wit and Humor.

A SUCCESSFUL WITTICISM.—In an exclusive boarding-house, the boarders (many of whom were *new*) had assembled in the parlor one evening, when an awkward silence prevailed, until a gentleman, anxious to relieve the cold embarrassment, rang the bell for the servant, who shortly appeared, and being asked by the gentleman "to bring a hatchet," said; "Sure, sir, what will you do with a hatchet?"

"*Break the ice,*" was the reply. A conversation ensued.—*Phil. Com.*

A NEW organization, which, from the peculiar, social, and financial condition of Washington, promises completely to overshadow the "*Know Nothings,*" has recently been effected in New York. The new order is called the "*Hive Nothings.*" The pass-word which gains admittance for the initiated is, "*Any Red?*" to which the reply must be, after an honest examination of the pocket, "*Many Red.*" A large number of our citizens are qualified for the places.—*Express.*

WHAT an agony of wit is in the following:—The Czar has *mustered* a hundred thousand men—the Sultan will *pepper* them, and England and France will *assault* them, and Austria and Prussia will show a *vinegar* face; so there will be a *pretty pickle* altogether.

BARON ROTHSCHILD, while complaining to Lord Brougham of the hardship of not being able to take his seat, said,—"You know I was the choice of the people." To which his Lordship replied, "So was Barnabas."

MOTHERLY ADMONITION.—An old lady, whose son was about to proceed to the Black Sea, among her parting admonitions, gave him strict injunctions not to bathe in that sea, for she did not want him to come back a "nigger."

A PERSON pointed out a man who had a profusion of rings on his fingers, to a cooper. "Ah," said the artizan, "It's a sure sign of weakness when so many hoops are used."

ELEGANT.—The phrase, "fighting on his own hook," is now more elegantly rendered, "wringing war upon the pendant individuality of his personal curve."

IT is said that the writer of "Salad for the Solitary," is about to write another book, probably—"Hash for the Hungry."

"LET us remove temptation from youth," as the frog said, as he plunged into the water, when he saw a boy pick up a stone.

TENTS FOR AGRICULTURAL EXHIBITIONS, &c.

TACKLES AND STACK COVERS FOR FARMERS!

THE subscriber, who for many years, has furnished TENTS for the N. York, Pennsylvania, Wisconsin, and other State Fairs, has on hand a great number of TENTS, suitable for County or State Agricultural Fairs, which he will SELL at a moderate price, or RENT, as may be desired.

Also, a large number of CAMP MEETING TENTS, of Duck, sufficiently light to resist water in the severest storms. All Tents intended for more than one family, will be furnished with canvas curtains, or partitions, and the outside curtains are so arranged, that they may be closed so as to entirely exclude the night air. Also, RAINDY TACKLE, for Farmers, a most useful article. For lifting bags, weighing hay, drawing logs and many other purposes, they are invaluable. Those having used them consider them almost indispensable. No. 1, filled up with 40 feet of good rope, $3,75; No. 2, filled up with 30 feet of good rope, $2,15.

Also, STACK CURERS, an excellent article for preserving Grain, &c., from rain. No farmer can afford to do without these covers, as often more than four times their cost is saved in one season.

☞ All orders, letters of inquiry, &c., (post-paid,) will receive prompt attention.

Address E. E. WILLIAMS,
229-41 No. 12 Buffalo st., Rochester, N. Y.

GENEVA MEDICAL COLLEGE.

THE next course of lectures, under the new organization, will commence on Wednesday, Oct. 4th, 1854, and continue sixteen weeks.

FACULTY.

WILLIAM SWEETSER, M. D., of New York, Institutes and Practice of Medicine.

THOMAS BUSH SPENCER, M. D., of Geneva, Materia Medica and General Pathology.

JOEL E. HAWLEY, M. D., of Ithaca, Principles and Practice of Surgery.

CHARLES AF A. BOWEN, M. D., of Geneva, Anatomy and Physiology.

JOHN TOWLER, A. M., Professor of Botany Free College, Chemistry and Pharmacy.

FREDERICK HYDE, M. D., of Cortlandville, Obstetrics, Diseases of Women and Children, and Medical Jurisprudence.

The fees for all the lectures are $82. Matriculation fee $3. Board can be obtained from $1,50 to $3 a week. Degrees are conferred at the close of the course, and in July. Further information may be obtained from either of the Faculty resident in Geneva. J. TOWLER,
229-21 Dean of the Faculty.

FOREIGN PATENTS.

THE undersigned continues to act as Solicitor and Agent for securing Patents in all countries where they are granted. He is represented in Europe by honorable and reliable men, of long tried experience, through whom he is enabled to secure Patents in England, Scotland, Wales, Ireland, France, Belgium, Germany, Austria, Russia, Prussia, Spain, Portugal, &c. His facilities for transacting foreign Patent business are unsurpassed. He can generally obtain Certificates of Provisional Protection from the British Patent Office, within six weeks from the time the invention is first committed to his care. The cost of British and other foreign Patents, to Americans, has been greatly reduced.

The undersigned may be at all times consulted, free of charge, by letter, or personally at his office, in reference to Patents, Inventions, &c. All consultations and business strictly private. For further information, apply to or address. ALFRED E. BEACH,
227-41 Solicitor of American and Foreign Patents,
People's Patent Office, 80 Nassau-street, New York.

FORBUSH'S MOWING AND REAPING MACHINE.
Patented July 29, 1852.

THE AMERICAN MOWING AND REAPING MACHINE CO. have purchased the Patent Right for the above Machine for the United States, England and Canada, and are now manufacturing a large number in supply the demands of the coming season. The advantages which this machine possesses over all others are obvious, and will readily be acknowledged by all disinterested persons. Being a *combined machine*, and working equally well in grain or grass, it enables the farmer of moderate means to procure a reliable *Reaper and Mower* in one, which will do the work of both, and at less than half the usual cost. As a Mower it has no superior; it was thoroughly *tested* the past season in every variety of grass, and in many different sections of the country, and in every case where it was properly made, it gave perfect satisfaction. It will cut and spread from 10 to 15 acres of any kind of grass per day. As a Reaper it has never been excelled, and has no rival that can in all respects successfully compete with it. The patent for this machine covers many points of excellence which have heretofore been unknown, and which (of course) can be used in no other. In the construction and arrangement of these machines great pains have been taken to secure the necessary strength, simplicity and durability. They are easily kept in order, and it requires but a few moments to change the machine from a Mower to a Reaper, and in either form it is equally strong and substantial. It is not liable to get out of order, and if any accident should happen it could be readily repaired by any ordinary mechanic. In the construction of the machines no expense has been spared to render them both perfect and durable. The Mower weighs but 731 lbs.—the Mower and Reaper combined 900 lbs. To any person desirous of purchasing, or of understanding the machine more fully, illustrated circulars will be sent with full descriptions, references, &c., &c.

Price of the Mower, ... $110 00
" " " and Reaper, ... 130 00

Terms—Cash in Buffalo. Delivered on boats or cars, free of charge.

Address orders or communications to the Company, or CHAS. W. SMITH, *Sec'y*, Buffalo, N. Y.

Further information can be had, and machines purchased of the following Agents:

S. M. DRAKE, Skaneateles, N. Y.
JOHN ADRIANCE, Po'keepsie, N. Y.
LONGETT & BRIFFIN, 25 Cliff St., New York City.
A. WAINMAN, Goshen, Conn.
A. W. TICKER, New London, Conn.
S. V. R. THOWBRIDGE, Birmingham, Mich.
GOULD & BENNETT, Brantford, C. W.
J. S. LOCK, Beloit, Wisconsin.
THOS. H. ALLEN, Waverly, N. Y.
C. J. ALLEN, Sinclairville, Chaut. Co., N. Y. 223-13t

CALCINED BONES.

THE subscribers have some hundreds of barrels of calcined bone-dust, a valuable manure, which will be delivered on the Railroad or boats at $1,25 per barrel of three and a half bushels. Orders by mail will receive the most careful attention. [226-4t] H. C. WHITE & CO.

GARDEN SEEDS.—We have a full and fresh supply of imported and best Shaker Garden and Field Seeds.—Merchants and dealers supplied on the most favorable terms. Catalogues gratis. Orders solicited at the Buffalo Agl Warehouse. [223tf] H. C. WHITE & CO.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 26 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

The Wool Grower and Stock Register is the only American journal devoted to the WOOL and STOCK GROWING INTERESTS. It contains a vast amount of *useful* and *reliable* information not given in any other work, and should be in the hands of *Every Owner of Domestic Animals*, whether located East or West, North or South.—Published monthly in octavo form, illustrated, at ONLY FIFTY CENTS A YEAR—5 copies for $2; 8 for $3. Vol. 5 commenced July, 1853. Subscriptions can begin with the July or January number. Back volumes furnished.

Address D. D. T. MOORE, Rochester, N. Y.

VOLUME V. NO. 23.} ROCHESTER, N. Y.—SATURDAY, JUNE 10, 1854. {WHOLE NO. 231.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper.

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. BIXBY,—H. C. WHITE,—T. E. WETMORE.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

☞ FOR TERMS, &c., SEE LAST PAGE. ☜

Rural New-Yorker.

Progress and Improvement.

A FEW WORDS ON BUTTER-MAKING.

THE production of Butter involves so many intricate questions of organic chemistry—so many nice physiological considerations—is influenced so much by climate, by soil, by food and the breed, age and condition of the cows, that an essay might easily be written on the subject, while it is exceedingly difficult to say anything interesting in a single short article.

Milk contains curd, sugar of milk, and butter. The latter exists in the form of small oily globules, encased by films of curd. These globules are specifically lighter than water, so that when the milk is allowed to stand, they gradually rise to the surface, and constitute *cream*. When the cream is kept at a moderate temperature, the sugar, under the influence of the curd and air, is transformed into lactic acid, according to well-known chemical principles.

The object of churning is to separate the butter from the curd by which it is surrounded. This is accomplished simply by agitating the cream and *breaking the films of curd*, setting the oil free, which runs together and forms lumps of butter. Cream from the formation of lactic acid, is generally sour before churning, and if not, always becomes so during the operation. The lactic acid acts on the films of curd, and renders them more easily broken.—During the process, the cream increases in temperature from 5° to 10°. The best temperature at which to churn the cream is a disputed point. It appears, however, to be well established by numerous experiments, that 55° when the cream is put in the churn, and about 65° when the butter comes, affords the best result. If higher than this, the butter is white and soft; if lower, the whole of the butter is not separated, and the labor of churning is much increased. The butter should come in from 20 to 40 minutes. If obtained quicker, it is generally at the expense of color, flavor and hardness. After the cream is "broke," it should be churned slowly till the butter is gathered.

Some good butter-makers do not wash the butter at all, merely working out the buttermilk by pressure. Where good, cool, spring-water can be obtained, we should always prefer to thoroughly wash the butter, taking great pains to remove all the buttermilk. Butter generally contains about 15 per cent. of water, curd, &c. It is important for the preservation of butter, that as much of this as possible should be removed. The quantity of salt required, depends upon the quantity of water in the butter. The water should be *saturated* with salt: hence, the less water the butter contains, the less salt will be required for its perfect preservation. When butter is sold fresh, 15 or 20 per cent. of water is not a material objection; but when we poor city folks have to buy so much water at 15 or 25 cents per lb., do let us have it clean and fresh! Give us water, and keep the buttermilk for the hogs at home!

We need hardly say that the most scrupulous cleanliness is required in all the operations of butter-making. Cream is more easily tainted by noxious gases than almost any other substance. Hence, not only must the dairy or cellar be itself clean, but all fumes from the barn-yard, or out-buildings, carefully excluded.

BONES AS A MANURE.

LEVI BARTLETT, of the *Practical Farmer*, gives his experience in regard to the preparation of bones as a manure. Some twelve years ago he spread a cart load or two of horn-piths on a grass swarth, and plowed them under with a coat of coarse manure. The next spring the plow turned up these piths, which were found to be "as sound as a roach." The field was laid down to grass, and when plowed up, eight years afterwards, "the small piths had considerably decomposed, but those from oxen and old cows were nearly as sound as ever."

His next experiment was by breaking up the bones with hand hammers, "a slow and discouraging process," and then mixing them with moist ashes, allowing them to lie in a heap for two weeks. An application of this compound "exhibited most favorable results."

Another experiment was with bones and horn-piths, boiled in a concentrated solution of sulphate of potash. "An hour's boiling would reduce piths to a pulp, and two or three hours would dissolve the leg and other hard bones of cattle and horses." Mr. B. thinks the sulphuric acid fixed the ammonia, while the potash converted the oil, &c., into a soap. The bone was as fine and white as flour. The whole was mixed with muck and made a capital compost. We should be personally obliged to Mr. BARTLETT if he would give us a little more information in regard to this process. We have tried many processes of reducing our ground bones without much success, but this is new to us, and under certain circumstances, we think it might prove economical and efficient. Would not sulphate of soda be nearly as good, and come much cheaper? Or, would not the bisulphate, containing a double quantity of sulphuric acid, be still better?

He next tried boiling in a caustic ley. This set free the ammonia "which penetrated every part of the house." Besides, it took twice or three times as long to reduce the bones, as when the sulphate was used. Nevertheless "it made a good compost." If the ammonia was all driven off, we do not see why it sho'd be much better than if the bones had been burnt.

In July last, he filled a barrel with alternate layers of bones, piths, and unleached ashes, and then poured on three buckets of putrid urine. In a few weeks the smaller bones, and the spongy portions of the others, were so soft as to be cut readily with a knife.

Mr. BARTLETT thinks that for the generality of farmers, the most economical process of reducing bones, is to first boil or steam them, and while hot to mix them with unleached ashes, covering the heap with loam or muck, to retain the ammonia. "A few months' time would be sufficient to decompose them, and during the process a large amount of nitrate of potash would be formed, and probably phosphate of potash, a more soluble phosphate than that of lime."

If this is the case—if nitrate of potash and soluble phosphate of potash are formed—the method is of great practical value. We must say, however, unless Mr. BARTLETT speaks from actual experiment, we should be inclined to question whether a *large proportion* of the ammonia would be converted into nitrate of potash, and still more whether phosphate of potash would be formed. Loam and muck have the power of absorbing ammonia, but not to a very great extent, and the heap of bones and ashes would require to be surrounded with such a large quantity that, from exclusion of air, decomposition would proceed very slowly. The method, however, is well worth a careful trial.

We fear there is no process by which bones can be employed as manure, equal to the old fashioned method of grinding. We think our County Agricultural Societies might do much to promote agricultural improvement, by erecting bone mills in their respective counties.—Each farmer could gather up all the old bones he could find and take them to the mill, just as he now does his wheat and corn, paying toll or so much a bushel for the grinding. It might not pay the Society at first, but it would ultimately prove a good investment, while the agriculture of the country would be greatly benefited.

BOY-FARMERS.—CAPITAL SUGGESTIONS.

MANY hints and suggestions of interest and value will be found in the subject thus *opened up*, by N. P. WILLIS, in his "Out-Doors at Idlewild" correspondence of the *Home Journal*. He has given the matter considerable attention, and finds in his neighborhood that "farmers are generally willing to admit, that a boy's work for *four hours a day* would fairly pay for his *board*. I find, too," he says, "in pushing inquiry as to the different kinds of farm-work, that there is but a small portion of it beyond the strength of a well-grown lad of fifteen. For ditch-digging, hay-pitching, cradling of grain, wall-laying and heavy plowing, they would depend, of course, on the main strength of a regular 'hand;' but for sowing, light-plowing, hoeing, weeding, carting and scattering manure, reaping, thrashing, and all the lesser industries of stock-tending and barn-work, a smart boy is often as capable as a man. This applies to grain farms, or to those mainly devoted to hay and stock. Where the produce is only fruit or vegetables for the city market, the work is easier, and perhaps the whole of it could be done by boys; * * * better done by them indeed, for it is mainly an exercise of *intelligent attention*, for which the Irish laborer is vexatiously incompetent.

"But boy-labor, to be reliable for the master, must not be boy-slavery. It must be enlivened and steadied by an understood footing of reciprocities between boy and master—both having an interest in its being faithfully done. And this is a state of things which could not be entered upon to-morrow—with the present general idea of how boys may be used. Information is sadly wanted on this subject. The most valuable addition which could be made, just now, to 'literature for the people,' would be a manual of boy-employment and treatment—defining his rights like those of a hired man, giving the terms of an agreement for his labor, specifying his privileges of spare time and agricultural instruction, describing the cure of him by the mother of the family, and plainly stating the ways to make him *think for himself and respect himself, and so be thought of and respected by those around him*. With this kind of understanding, every intelligent farmer could profitably take half a dozen boys to work with his one or two hired men, and teach them farming while allowing them to play enough and read enough, as well as earn enough—a Utopian idea for the present, perhaps."

With an additional hint, we will conclude our extracts for the present, but shall probably give more in future. Those now given concern parents who are farmers, and who desire to retain their boys on the farm, as well as those of other professions who would have their boys become true "Country Gentlemen."

Mr. WILLIS says, *en parenthesis*:—"The *clothes*, by the way, are the sore spot in *boy-wrongs* in the country, and the extinguisher to that *boy-pride* without which his character becomes the fruitful soil for rustic meannesses.—Among the old farmer's 'dodges,' the excuse for all his over-workings of the boy is 'the money it costs to clothe and school him'—while the poor lad's habiliments are the reminders of the old man's worn-out coats and trowsers, fitted and patched with such skill and taste as Heaven may have vouchsafed to the old woman's needle."—R.

GOOD HENS.—Mr. D. C. HONART, of this place, has four pullets that have laid twenty-six dozen of eggs, from the 17th of January last, up to this date. The breed is Pheasants crossed with Creoles; their feed oats and corn, all they would eat. No extra place for roosting. They show no inclination to set, the only fault found with them. L. N. PERRY.

Homer, N. Y., May 23, 1854.

PLASTER ON POTATOES.—A correspondent of the *Country Gentleman*, plastered one-half of a field of potatoes at the first hoeing, leaving the other half unplastered. At the second hoeing, there was a great difference in favor of the plaster, and at harvest the plastered yielded double the quantity of the other, and of a much larger size.

MINNESOTA.

WE have recently received, through the kindness of Col. O. H. KELLY, Corresponding Secretary, a pamphlet containing the proceedings of the Agricultural Society of Benton Co., Minnesota, held at Sauk Rapids, Dec. 12th and 13th, 1853. The proceedings contain the address of Gov. GORMON, delivered on the occasion, and as the Gov. gives some facts concerning this growing member of our confederacy, and the state of its agriculture, we presume many of our readers may be interested to hear of her prosperity and prospects.

It is hardly five years since the first furrow was turned by the husbandman within her borders. The last United States census returns give the number of acres of land in farms at 28,881, of which some 5,000 were improved.—the whole valued at $161,948. How many acres their farms now include we cannot say. That there has been a large increase there is no doubt. Returns from the Land office show that during 1853, up to the 1st Dec., there were bought, located by warrants and pre-empted, over 160,000 acres.

The soil of the open prairie is of a sandy nature; on the bottoms, and where oaks and hazel abound, it is dark and rich with less sand. In parts clay abounds, with ledges of stone or rock. The timber comprises the various kinds of oak, with bass, elms, ashes, maples, beeches, &c., with abundance of shrubbery, wild plums, &c. The marshes and low lands furnish wild hay that serves a good purpose to the new settler. A species of rushes abound in some parts that is very highly relished by stock, and from the rapidity that cattle take on flesh, when living on it, it must possess highly nutritious properties.

Cranberries are produced in abundance, large and very fine, and are a source of considerable profit. Wild rice abounds around the lakes; when gathered and properly prepared it makes an excellent substitute for rice. Indeed, by some it is preferred. It is also relished by stock, and can readily be made, it is thought, a source of profit.

The weather in the winter months is cold—the thermometer not unfrequently getting down among the thirties. But whenever this happens, it is remarked, the air is very calm and bracing. There is this advantage, too, less changes occur, from one extreme to the other. The spring comes forward in good season, so that in May the farmers are busy sowing and planting. Frosts are apt to linger, but not enough to prevent the raising of good crops of corn. The summer is hot, but made comfortable by fine breezes. Toward the latter part of August cool nights begin, followed with frost about the 25th or 28th of September.

Regarding crops, favorable accounts are given. Corn, of which some have entertained the opinion that it could not be raised, comes to maturity, and yields 40 and 50 bushels to the acre, and indeed upward. Of wheat, the winter varieties have been but little tested, but with flattering results, except when they have an open winter, which we suppose is not usual. Mr. RUSSEL, of Sauk Rapids, harvested, the past year, 120 bushels from three acres. Spring wheat gives a fair yield of 18 to 30 bushels, and even upward. Oats are a fair crop, yielding often 50 and 60 bushels to the acre. Rye has not been enough tested to speak of.—Buckwheat gives a good yield. The potato appears to be at home on Minnesota soil, and gives a yield of 200 to 400 bushels to the acre of the best quality. Onions, turnips and all the vegetables of the garden, grow luxuriantly, and give abundant yields.

The Minnesota Farmer has a ready market at his door, and at high prices for all his produce, and will continue to have for many years, to supply the influx of immigration, and the wants of Government, which supplies the Indians of that region with many thousand dollars' worth of provisions annually. Farmers moving thither are recommended to bring along their tools, cattle, sheep, &c.

T. P. W.

THE *Mark Lane Express* says, all manures covered by the soil have a natural tendency downwards.

ROAD-MAKING.

THE road-making season is here, so we are reminded to give a few hints on the subject.—It is one of importance to all, as much to the dweller in the city as in the country—to the supplied as to the supplier. The farmer wishes good roads to go to market, and the townsman wishes good roads that the market may be freely and constantly supplied.

In road-making one great requisite is the ready and total removal of all water. There can not be a good road where water stands by the side of, or in it. If the ditches have no ready outlet, the road-bed will soak up the moisture more or less, by capillary attraction, and thus remain rutted and muddy. It is vain to think of having a good road on a subsoil, filled with stagnant water. Even on side-hills, if water remains on the upper side, it will injure the road by passing under. Provide then, if possible, for the thorough drainage of your roads—either by surface or covered ditches.

See, then, that the road-bed is evenly and slightly rounded, so that the water can readily find its way to the drains. If the soil is clayey or loamy, give it a few inches of gravel, or even coarse sand, and you will have a fine and pleasant passage way. If the soil is sandy, it needs an addition of clay to correct it, and this will correct it, so that good roads may be had over the lightest sandy soils. Further hints might be given, but to those who can refer to the former volumes of the RURAL, they are unnecessary, and to our new readers, these are the most important on the subject.—R.

CULTIVATION OF PUMPKINS.

EDS. RURAL:—The cultivation of pumpkins is regarded by many farmers as a secondary affair, but I regard it as a very important one, for pumpkins may with justice be classed among the best articles farmers raise. For producing rich milk, they are one of the very best things that can be fed to cows; they are useful in fatting swine, by increasing their appetite; they will give fatting oxen or other cattle, a better start in the fall than turnips or potatoes. The pumpkin will grow and generally succeed well on any ground that will produce good corn. They are usually raised with corn. Care should be taken not to plant them too thick, as the vines extend over considerable ground; if planted with corn, every alternate hill in every third row is thick enough.—Rich stable manure should be applied freely. The first of June or the last of May, is early enough in our latitude, I think, to plant pumpkin seeds, on account of the early frosts. After the plants are up and the danger from frosts is past, then comes the "tug of war" with the little striped yellow bugs; they come in swarms, and will in a short time, if left to themselves, destroy the whole crop. The most effectual way to keep them off, I think, is to sprinkle the plants as soon as up, with plaster; put on enough to make them look white. If it is washed off by rains, sprinkle again, and continue to do so till they are out of the way of the "varmint." After the vines begin to run, care should be taken not to obstruct them. P. H.

"IS BARLEY GOOD FOR EWES?"—In the inquiry of "A Subscriber," in a late number of the RURAL. The only experience the writer has had, was last winter, when he fed sixty-eight Leicester sheep three pecks of barley per day, and what wheat straw they wanted, giving them no hay or other food, until the 21st of March. Forty of the number were ewes, which commenced dropping their lambs the last days of March, and a sorry time for the little fellows it was. The ewes were then fed with barley, buckwheat, potatoes and hay.—The total yield was fifty-two, of which forty-five were saved. Only seven died, and there was good cause for the loss of a part of them, aside from the weather and feed. The lambs were generally strong, and are doing well.—Nevertheless, I did not like the grain, for during the winter the sheep were much troubled with stretches, which I was disposed to ascribe in part to the barley. I much prefer oats or buckwheat.—W. B. P., *Prattsburgh, N. Y.*

Communications.

CONVERSATIONS ON AGRICULTURE.—No. IV.

BY HUGH T. MOORE.

The sum of human life is to *know*, and to *do*. The next great step in human progress is to put in practice what we have learned—it is so in agriculture and in morals. To labor and to pray for light that we don't mean to walk by, is neither good farming nor good orthodoxy.

Computation limps and lags when it attempts to estimate the world's obligation to Liebig, Johnston, Norton, and their scientific confederates. But all we have learned from them is not half the value of some thread-bare maxims, which our grandfathers were as familiar with as we are—here is one of them: "take time by the forelock," or plainly and without metaphor, *do every thing at the proper time*. Without a university origin, or any great genius to give it the endorsement of his name,—this plebian truth challenges our attention.—Neglecting it, we may sacrifice more in a week than modern science will bestow on us in a season.

Joseph Gould, now deceased, who lived near Wyoming, sustained the reputation of being a good farmer. He was in fact a sort of oracle, a model farmer for the neighborhood, albeit he held science and book-farming in very low estimation. Lame he undoubtedly was in this last particular, but he made it up in other strong "points." His neighbors, Messrs. Everest, often remarked—"Joseph Gould always would keep ahead of his work." This doubtless was the secret of his success.

A little too late, has spoiled many a fortune, and wrecked many a hope. Reflections of this kind seem well adapted to the present time. The season—no reflections on Providence—seems rather late. Farmers should revise their programme of business and see if they had better not omit something. Then they will do well to calculate their means of executing what remains to be done.

Good machinery for all the various purposes of agriculture, should at once be secured—cultivators of improved models, mowers, reapers, grain-drills, &c., &c. Whatever will save labor and improve husbandry, should be resorted to. Beware of *economy*, it is the bane of our agriculture. A poor tool, or the want of one, often costs ten times the price of a good one. Secure plenty of help—more than you expect to want. If you should get along faster than you expect—which never happens except on the journey to the grave—you can easily take up some long-neglected improvement.

I have seen five days' work expended in pulling the weeds out of a crop of carrots, when one day's work at the right time would keep them down. I have seen twice the labor expended in cultivating the grass and noxious herbs among corn, that would suffice at the proper time to keep the ground in good order. I have seen crops utterly fail because the seed was sown too late, and I have seen a good crop ruined by harvesting too late. Be up and doing. Now is the time when a vast amount of work requires to be done on our farms; and it is right, I think, that we should call into the field the *trades* and the *professions* to help us. What say you, gentlemen, of "sedentary habits?"

THE GRAINS AND GRASSES.—NO. V.

Corn—(*Zea Maize.*)

One of the gifts bestowed by the Good Spirit to the red denizens of the forest, according to Indian tradition, was corn. This is the great grain crop of the United States, and is cultivated from Maine to Mexico, and from the Atlantic to the Pacific. Previous to the discovery of America, we have no authentic account of the existence of maize. It is true much has been written to prove it to have been of Eastern origin, but if corn was cultivated by any of the eastern nations, some evidences of the fact would surely have remained in history, sculpture, or painting, even if the grain itself was lost; but such is not the case, nor has it ever been found in any ancient eastern sarcophagus, zumulus or pyramid; hence we conclude that it was unknown. In proof of its western origin, we may mention the fact that Columbus found it cultivated by the Indians on his discovery of America. The first colonists found it in all parts of the American continent where they landed, possessed by the Aborigines. The maize is even now found growing wild from Oregon to Paraguay.—These facts place the origin of maize on this continent beyond a doubt. It seems, in fact, to have been created especially for the Western Hemisphere, where it riots in wild luxuriance on our rich, virgin soils, and beneath a hot and burning sun.

The corn crop far exceeds that of any grain crop raised in the United States. According to the census returns of 1840, the amount was 377,531,875 bushels, and in 1850 it was no less than 592,326,612 bushels, the most of which was raised in the Middle and Western States. Of this amount New York raised 17,858,400 bushels, Pennsylvania 19,835,214, Ohio 59,078,695, Michigan 5,641,420, Indiana 52,964,363, Illinois 57,646,984. Of the Southern States Missouri produced 36,214,537, Kentucky 58,675,591, being the most of any Southern State, Tennessee 51,276,223. Ohio produced the most, and Oregon the least, being only 2,918 bushels; it is said that the climate there is not favorable to its culture. The crop has increased in every State and Territory in the Union; during the last ten years, the increased production has been over 214,000,000 bushels, equal to 56 per cent. The increase in New York has been over 50 per cent. in New England nearly 50, while in Illinois the increase has been 260 per cent.—The amount exported in 1770 was 578,349 bushels; in 1840 it was 1,286,060 bushels, and 232,284 barrels of meal. In 1850 it was 3,426,811 bushels, and 203,622 barrels of meal. The largest amount exported in any 12 months was during the famine in Ireland in 1846–7, amounting to 16,326,050 bushels of corn, and 948,068 barrels of meal. In 1850 over 11,000,000 bushels of corn were consumed in malting and distilling.

The uses of corn are various. The largest amount is consumed by the growers in making pork and beef. It is also extensively used in feeding working horses and cattle. For this purpose, if the corn is soaked in the ear 24 or 36 hours before feeding, they will consume cob and corn without any injurious results. It is good economy, also, to grind the corn, cob and all, and feed mixed with cut straw or hay. In fattening hogs it pays well to cook the corn either ground or whole. This may be done with good economy, mixed with potatoes, apples, or any of the root crops. I have found it advantageous to start hogs on green corn cut in the field, stalk and all. They will consume nearly all the stalk, as well as the corn and cob. At the west it is a common practice to feed the corn in the field; this is thought to be a good practice there, and has some advantages,—one of the most prominent of which is the even scattering of what is consumed, and what is left, over the ground as manure for the next crop. In most cases it would be better to use hurdle fences so that the cattle and hogs could be let into the corn only as fast as they consumed it. This is the common practice in England, in feeding turnips. It is seen, by the census returns, that corn is extensively used in distilling. To this there could be no objection, if the liquor thus produced was used only for chemical, mechanical and medicinal purposes, as the grain is worth nearly as much for fattening purposes as before. Corn is extensively used for food in various ways, as bread, cakes, puddings, boiled or roasted, when green or dry. It is used in manufacturing starch and corn farina. The stalks are nearly as good for cattle, sheep and horses as hay, but should be cut fine, else they will eat nothing but the leaves.

From the stalks can be manufactured beautiful sugar, and it is supposed by some that an acre of stalks will yield as much sugar as an acre of cane. From the grain can be extracted a good quality of oil. I. A. Clark.

Marion, Wayne Co., N. Y., May, 1854.

QUACK GRASS—AGAIN.

Editors Rural:—There is a saying, that a "Dutchman should be allowed to speak twice on the same subject," and I believe I must claim the privilege of writing twice, especially when such a writer as your correspondent "H. N. L." puts in a rejoinder to my Quack Grass article. It never occurred to me that any man would ever sow quack grass seed. I thought that its growth was spontaneous, and that, being an aquatic grass, it required for its growth what would be an excess of water to any other grass, and ruin to the wheat crop. I would advise "H. N. L." to dig a hole 2½ feet deep in his sand, and see if he has not got water to excess. I have seen many sandy ridges that showed no water, excepting at the *base*, wet enough to kill wheat and produce quack; and I know that land that naturally produces quack grass, will never produce a remunerating crop of wheat unless it is drained.

I had always more or less wild mustard on my farm, and could not exterminate it until my land was drained, and it then all disappeared, without any exertion on my part.

John Johnston.

Near Geneva, N. Y., May 31st, 1854.

Hens should be kept warm in Winter.—I saw an account of 27 hens kept last winter in an open shed, where they laid 52 doz. eggs in 4 months. Now it is my humble opinion, that if they had been kept in a warm place they would have laid still better. Last winter I had 24 hens a part of the time, but about the middle of the winter killed off 4; I kept them in the basement of a barn, fed them with all the screenings they would eat, and, occasionally, a little corn, and in four months they laid 70 doz. of eggs. I had some Brahmas, some common, and the rest were common crossed with the Shanghai. My hens laid more eggs last winter than they do this spring, because now they are very much inclined to sit. M.

Agricultural Miscellany.

PREPARING LAND FOR WHEAT.

There has a change taken place in the minds of many wheat growers within a few years past, in regard to the best method of fitting ground for the wheat crop. Formerly, the summer fallow system, plowing the ground early in the season and frequently stirring it afterwards to intermix and reduce it to fine tilth, was considered the best method; but recently the opinion seems to prevail to considerable extent, both among farmers and their scientific advisers, that by practicing the old method, a serious loss is sustained in unnecessary labor, in the loss of the land for pasture or for hay, and in the escape of fertilizing elements, while the soil is thus exposed to the action of the atmosphere; and that a better course is to defer plowing until a later period, and thus obviate the objections urged against the former method.

Here are have two opposite methods of cultivation prevailing, and strenuous advocates for each, but has it yet been fully demonstrated that as remunerating crops of wheat can be grown by the latter method as by the former? Will the general results be the same on different kinds of soil? Again, have we sufficient proof that, by exposing the soil to the action of the atmosphere, we rob it of its fertility; and if so, are all soils affected alike? These are important questions to every farmer, and it is high time they were definitely settled. If we have been losing the use of land for months yearly, and expending much labor to no purpose, and at the same time been impoverishing the soil, it is certainly time it was known.

Now, as there is no way to determine conflicting theories of this kind but by experiments, I propose to enter upon some, the present season, (health permitting,) to fully test this matter, and, if possible, arrive at the truth.—As experiments conducted upon one kind of soil will only be conclusive so far as that soil is concerned, I invite others living in the different sections of our country, occupying different soils, to join me in the effort to settle these important principles of tillage that are now in dispute. The plan I propose to follow in the first experiment is this: I have a field intended for wheat where the clover has run out, and there is but little sward. This field I intend to plow in June, if not earlier, as deep as possible, say twelve or fourteen inches, leaving one-fourth of an acre unplowed until late in the season, and then fit in the best possible manner, in as little time as possible. An adjoining one-fourth of an acre I design to plow, harrow, cultivate and roll at least a dozen times during the season. Then sow the same amount of seed on the different pieces, and sow at the same time, and note carefully the results until harvest; then harvesting and threshing separate, and weighing both wheat and straw. In this way I think I shall be able to determine the difference on a clayey soil, of the two methods, and also, ascertain whether that kind of soil loses its fertility by being long exposed and frequently stirred.—Linus Cone, *in Farmers' Companion.*

Remarks.—May we hope that there are many farmers in all parts of the country who will gladly accede to the proposition of Friend Cone? It is an important question which practical experiments can alone fully settle. For our own part, we have been long convinced that a clayey soil would lose nothing by exposure to the hottest sun in the most arid winds, and that the summer fallow is the best, if not the only method of preparing such soils for the wheat crop. On lighter soils summer fallow is altogether unnecessary, except when they are so foul that they can be cleaned in no other way. On very light, sandy soils there may be loss of valuable gases from exposure to a hot sun, but we are persuaded that it is much less than some of our theoretical instructors would have us believe. In fact, in nearly all agricultural soils there is a gain rather than a loss from constant stirring and exposure. We know so little, however, of the nature of soils, that, at present, it is difficult to say to what property this increase of fertility is owing.—Don't be afraid, however, to stir the soil.—Experience sanctions it, and *true* science does not condemn it.

Winter Kill.—A friend in Seneca county writes:—"There is great complaint among farmers that their wheat is killed by freezing *in the ground*, not by the roots being lifted out of the soil. In Michigan they say it was killed by the ice. Even Johnson's underdrained fields are somewhat injured by frost, although not as bad as those of his neighbors."

Rhode Island Ag. Society.—We have received the Transactions of the Rhode Island Agricultural Society. It is a neat pamphlet of some 150 pages, occupied principally with matters of local, though not of general interest. The address of "Professor James J. Mapes," for which we observe the Society paid him $122, is a characteristic effusion.

Chester County Hogs.—A correspondent of the Penn. *Farm Journal*, says he purchased a sow last spring, which produced him nine hogs, which when killed at six months old, averaged 212 lbs. each, and the sow weighed when killed in February, 617 lbs., "thus making an aggregate of 2,525 lbs. of pork."

Stumps and Bushes are serious obstacles in the way of successful and thorough cultivation, and should be removed and destroyed at any cost.

WHAT TIME SHALL WE CUT TIMBER?

Never in winter, but always in summer. It should be cut during the most rapid season of growth, and while that season is drawing towards a close. The same rule should be followed that skillful nurserymen observe in performing the operation of budding—that is, just as the terminal bud on each branch begins to form—as soon as it is first evident that the growth of the branch is about to terminate, but is still in active progress. Experienced tree propagators have found that much earlier than this, the juices of the trees are so too thin or liquid a state to form a good adhesion between the bud and the peeled surface. From the moment that the bark separates freely from the wood, these juices continue to thicken, until growth ceases altogether and the new wood is completely formed; and when this new wood is in the state of a thick paste or cement, then is the time that the bud will adhere most perfectly. This is the period when the bark may be peeled from a tree without destroying its vitality. And this is the time for cutting timber. Early in the spring, the tree is full of sap, which is little else than pure water, and which has been gradually accumulating through winter by the absorption of the roots, with no outlet for its escape, as there is in summer through myriads of leaves. While the tree is thus replete with water, it is in the worst condition to be cut. But towards mid-summer, when a portion of this water has passed off through the leaves, and the rest has been much thickened by conversion into material for wood, the case is very different; for while the water sap promotes only decay, the thickened juices soon dry and harden, and assist in the preservation of the wood.

We have recently been furnished with a number of facts, in corroboration of this opinion, by Isaac Hathaway, of Farmington, Ontario county, N. Y., an old and enterprising settler, a close and extensive observer, and who has had much experience in connection with saw-mills and timber erections. All his observations tend to show the great difference between winter and summer cut timber, and induce him to think that, cut at the best period, it will last under the average of circumstances three times as long as when felled in the winter. In one instance, a fence, consisting of winter cut materials, a part split into rails, and a portion in round poles, of beech, maple, iron-wood, bass-wood, &c., had completely decayed in fifteen years, and none of it was even fit for fire-wood. In another case, a quantity of bass-wood rails were cut in summer, and split from the brown or heart portion of the tree. This was done about fifty years ago; thirty years afterwards the fence was quite sound, and even now some of the same rails remain undecayed, although much worn away by the weather. Winter saw-logs, left over one summer at the mill, are usually much decayed for several inches towards the interior; summer-cut logs, which have laid a long period, are always sound. He has cut hickory for axe-helves; if done in winter, decay soon commences, and the worm which loves this wood, often wholly destroys its value. Summer cut, he has never known it to be attacked by the insect, and indeed it seems too hard for them to penetrate. He has had occasion to examine several old frame buildings, and in every instance where the period of cutting could be determined, the same striking difference in durability was conspicuous.

He related several experiments on the durability of posts, one of which is worthy of repetition. In a gravelly soil, where the water never remains, a stone bottom a few inches thick was laid in the post-hole, on which the post was set, and was then surrounded with stone closely rammed in on every side. As a consequence the water never remains long enough in contact with the post to soak its interior, as would be the case if damp earth pressed its outer surface. Such posts consequently give promise of remaining sound, after some year's trial, at least twice the period of those simply packed in earth. He also finds that posts of what is termed the white cedar in Western New York (the American arborvitæ) last much longer when set green with the bark on, than if sawed and seasoned, which he attributes to the protection afforded by the durable bark, against the vicissitudes of rain and drouth, and the air and weather generally.

Now that the season is approaching, best adapted for timber cutting, as indicated in the preceding remarks, we hope those interested will at least satisfy themselves on the subject by a fair and careful trial.—*Country Gent.*

To destroy Lice and Ticks.—Mix with a sufficient quantity of salt for ten head of cattle, or an hundred sheep, a tea-cup full of sulphur, and give it to them once a week, and my word for it, your stock will not be annoyed any more by these pests. Sulphur should be given to stock, in small quantities, with their salt, the year round, as it conduces very much to the healthy tone of the animal system. Flax seed is also very beneficial in expelling vermin from stock; especially young calves; and being very hearty food, causes them to thrive wonderfully. I once heard an old gentleman say, "you might take a calf that was so lousy he could not get up, give him half a pint of flax seed daily for three weeks, and he would whip every creature in the barn-yard!"—*Mich. Far.*

Threshing Seed Wheat with Machines.—Having seen some statements that seed wheat was damaged by being threshed with machines, I took a little notice of mine last fall. My wheat was plump and good, and threshed by a machine. After it was sown, I noticed a moist spot where the wheat was not covered but had sprouted. I commenced counting, and counted 96 kernels all sound, and found but one that had the chit broken. I came to the conclusion that my wheat was not injured by the machine more than it would to have been flailed.—T. W. Dunham, in *Mich. Farmer.*

Hops are looking finely, for this season of the year. Some of the more enterprising and ambitious vines have already reached an elevation of eight feet on the poles.—*Otsego Rep.*

SUBSOIL PLOWING.

The expediency of using the Subsoil plow must depend on the particular condition of the subsoil, and the object in view, as to the kind of crop to be cultivated. Actual and careful experiments are still required to demonstrate the results of subsoil plowing under different conditions. It is reasonable to suppose that the breaking up of a dense and firmly packed substratum, may favor the growth of plants.—On the other hand, there are instances where the soil and subsoil are already too loose and open, both to afford a proper hold for the roots of plants, and to retain moisture and the soluble elements of manures. Results from the use of the subsoil plow, agree with this reasoning. But more varied and thorough trials, in regard to different soils, and the product of different crops, are needed. Perhaps it may be assumed as a general fact, that subsoiling tenacious soils, when they are properly drained, is beneficial. Without drainage, loosening of the subsoil is at best only useful for a short time, as the earth soon settles together as closely as before. In many places a hard, or "hard-pan," is formed in the earth by the deposition of iron, or the compounds of this metal. Such deposits are poisonous to vegetation, and they have been broken up with the subsoil plow with good results. The operation permits the penetration of air and rains, which decompose and carry off the noxious substances.

Much is said, of late, about deep plowing, and many advocates of the practice use little or no discrimination in regard to soils. Admitting the general advantage of deep tillage, the subject involves a question which can only be settled by experiment. Should the depth, beyond six or seven inches, be effected by an implement which reverses the position of all the earth that is moved, or should it be done by the subsoil plow, which only loosens the earth without turning it upside down? We pause for a reply.—*Boston Cultivator.*

Corn for Fodder.—In answer to an inquiry as to the method of raising southern corn for fodder, the *New England Farmer* says:

"Plow and manure your land well, and then make a broad, shallow furrow, by going both ways with a small plow, and then sow the corn liberally in the furrow. Five or six rows ten rods long each, we should think, would require half a bushel of seed. The common yellow or white flint southern corn, such as may be found at any of the grain stores, is the kind mostly used. It should be sowed quite thick or it will grow so stout that the cattle will refuse to eat it. It is a very difficult crop to dry sufficiently for winter use, but with favorable weather may be cured by allowing it to wilt for a day or two after cutting, then tie in small bundles near the top and hang upon the fences or poles laid up for the purpose."

Value of Roots.—In the winter of 1852–3, we fed 7 cows on good English hay, cut and mixed with one quart of oil-meal and two quarts of cob-meal, per day, for each cow. In the winter of 1853–4, the same cows, coming in about the same time, fed on hay cut upon the same ground as that of the previous year, and with the addition of 4 bushels of ruta bagas per day, but not a spoonful of grain of any kind, gave just *double the gallons of milk* that they did when fed on grain! The circumstances under which the cows existed, both winters, were alike, with the exception of temperature—the weather being much the coldest when they gave the most milk. The barn, however, on which they were kept is a very warm one, so that in the coldest weather they were all comfortable.—*N. E. Farmer.*

Clover for Manure.—Mr. D. D. T. Moore, of Watervliet, in this county, informs us that he sows clover seed with his barley crop, for fertilizing his land. Last year he turned under a clover sod—the seed sown the previous spring with barley, but not fed off after the barley was harvested—on the 8th of June, for a late crop of corn. To ascertain the weight of the crop of clover thus turned under, he cut a square foot of the sod, shook off the soil, and found the weight of the clover and its roots to be 2¼ lbs. This would give 49 tons, weighing probably about eight tons if thoroughly dried, per acre, to turn under, at an expense of only $1,50 for clover seed.—*Country Gentleman.*

Hoeing Wheat.—On Wednesday last we took an hour's stroll in the country—a luxury we seldom enjoy. We noticed a novel feature introduced in farming, which we doubt not will be new to many of our farmers.

Charles Hinmon, one of the most thorough and skilful agriculturists in Western New York, was actually hoeing a field of wheat containing twenty acres. The wheat was sown in drills, and five or six men, each taking four or five rows, stirring up the soil, and destroying most of the weeds. The expense is about five dollars per acre. This is probably the first experiment of the kind in this country.

I had a very fine colt that carried his tail on one side, and was continually throwing it over the driving line, when to cure him of this habit, I braided a loop in his tail and tied it with a string to the trace on the same side on which he carried it, and when he found it was tied, he would pull on it, when I would let him up a little gradually on the string, until at length he came to carry his tail perfectly straight.—J. H. P., *Boston Cultivator.*

Young Animals.—Young animals should be kept growing until they reach maturity. If they are suffered to get poor and stop growing, they will retrograde and never attain a full size; and without grain, or something better than hay, it is next to impossible to keep them in that condition, especially the first winter.

High Prices.—In some portions of Aroostook county, a few days since, hay was selling at $40 a ton, and oats at $1,25 a bushel.—That will do for "Down East."—*Me. Farmer.*

Orchard and Garden.

A MODEL HORTICULTURAL ESTABLISHMENT.

The Oaklands Nursery and Green House of J. B. Eaton & Co., Buffalo, comprises one of the finest Horticultural establishments in this country. During a recent visit to Buffalo, we passed some hours very pleasantly at "Oaklands," and were most agreeably surprised and delighted to find so complete and perfect an establishment. Compared with Rochester—which probably has the most celebrated and extensive Nurseries of any place in the Union—Buffalo is comparatively little known horticulturally; yet "Oaklands" surpasses any thing in its line in the "Flour (more properly *Flower*) City," and must become widely and favorably known. The establishment is altogether most creditable to the proprietors, and Buffalo,—and we wish every village and city in the land were equally favored. Horticulturists, professional or amateur, passing through our sister city, will find that a visit to "Oaklands" will prove a good investment.

We intended to give a brief description of the establishment at "Oaklands," but find so complete a notice of it in a late number of the Buffalo Commercial Advertiser, that we prefer quoting therefrom. The Commercial says:

The approach to the Green Houses is over an extensive lawn, beautifully diversified with roads and paths, and dotted with clumps of trees and parterres of flowers. The Green Houses are entered from the front, into the Conservatory, an octagonal structure, 30 feet in diameter; in the centre is a "rockery," now occupied by a tasteful disposition of an immense family of the Cacti in superb bloom; the sides are lined with climbing roses of rare varieties. Passing through the Conservatory on the right, you enter the Geranium House, 20 by 60 feet in dimension, furnished with stage shelves, presenting a most gorgeous display at the present time; from the end of this house you enter the Forcing House, 20 by 50 feet: this house has a pit or bed in the centre, with shelves on each side; here are now arranged the beautiful family of the Fuschsias, in magnificent bloom, and embracing near 100 varieties. On shelves, at the sides, are arranged verbenas, roses, azaleas, heliotropes, &c.

Retracing our steps, we come back to the Conservatory, from whence we pass into the Hot House, running parallel to the Forcing House, and of the same dimensions; this is also furnished with pit and shelves, and is occupied with a variety of flowering plants, which are here kept at a low temperature. Retracing again to the Conservatory, proceed through a door opposite that of the Geranium House, to the Rose House, 20 by 60 feet; this is furnished with elevated shelves, as in the Geranium House, and has a shelf running in front; at the west end, is a border in which are plunged Camelias, Roses, &c. From the Rose House we pass into what we would call a Cold House, where Roses, Camelias, &c., are kept when out of bloom. Here is one of the finest collections of hardy imported Roses to be found in the country. In addition to the six houses or departments we have named, there is a Propagating House, 12 by 40 feet, connecting with the Hot House by a side entrance, containing a heated pit on each side, and pathway sunk between them.

The Green Houses connect with the offices, dwelling, &c., and are all heated by a powerful hot water apparatus. The pipes are from 4 to 6 inches in diameter, and are nearly 3000 feet in length: these are all heated by one furnace, situated in the basement of the office.—In the same basement is a powerful steam pump, which elevates the water for the supply of the houses, from capacious cisterns and a well adjacent, into reservoirs located in the attic, whence it is conveyed by pipes to all parts of the Green Houses, and also supplies a beautiful fountain in the rear of the Green Houses. Hydrants are also placed at convenient distances, and in the stables attached. The establishment is, unquestionably, one of the most complete in the country—everything about it is finished up in the most thorough manner; and when it is recollected that it is scarcely a year since the first brick was laid in commencing the structure, the tact, industry and energy displayed may somewhat faintly be estimated.

The grounds attached are only some twenty acres in extent; but we will venture to say that in no public collection, and but few private ones, in the Union, can the same variety of fruit and ornamental trees, shrubs and flowering plants be found. Two years since, the major part of the grounds were considered a swamp, of very doubtful value for garden purposes, but by a scientific course of underdraining, Mr. Mason has succeeded in making it one of the most desirable soils imaginable.

The whole establishment at Oaklands, is evidently of exquisite taste, perseverance, and business tact on the part of its originator, Amasa Mason, Esq., whose passion for horticulture has led him to perfect this beautiful establishment. Mr. J. B. Eaton is the managing business partner, and the establishment is conducted under the name of J. B. Eaton & Co. Mr. Eaton, though a young man, has already earned some fame as a successful horticulturist, and bids fair to emulate his accomplished partner.

A correspondent of the Boston Cultivator says that a bouquet of flowers will remain fresh much longer in a glass of water to which half a tea-spoonful of common salt has been added than in fresh water.

The New York Horticultural Society have determined to give up their autumnal exhibition, and to render all their aid to the Horticultural Exhibition of the State Fair.

A GERMAN PEAR.

The true name of this pear is unknown to me. I received the grafts second-hand from Germany. It was brought here together with the *Flemish Beauty*, by a German who considered these two the most profitable pears in that country. It differs from the *English Jargonelle* in the straight and upright limbs of the tree, and the more obtuse form of the fruit at the stem end, and the absence of the brownish red of that variety. It may prove identical or a variety, as climate frequently makes a marked change in fruit. The outline given above is from the actual fruit, which is always of a fair size. The time of maturity is the first of August; it is invariably of a greenish yellow, and the flesh is juicy, with a pleasant, refreshing subacid flavor. Although not of the finest quality, its large size, early maturity, and the great productiveness of the tree, render it worthy of general cultivation. My tree is now twelve years old from the seed, and was grafted with this variety about eight years ago. The second year the graft fruited, and has continued to do so ever since. This tree bore six hundred pears the past season, a large crop for so small a tree.

Dudley, Hardin Co., Ohio. Wm. C. HAMPTON.

REMEDY FOR THE SCALY APHIS.

About two years ago I put into a thirty-two gallon cask twenty pounds of sulphur, with about three shovels full of lime, filling up the cask with water, using fully half of the solution at the time, for syringing roses, &c., that were affected with the mildew; the remainder had stood for three months, and had become very strong, assuming a deep red color. I had at this time a plant of *Epiphylum speciosum* that was so badly affected with the white scale, that I had taken it out of the house two or three months previous to its undergoing the operation I am about to speak of. I may here remark that this plant was in a worse condition than any living plant I had ever seen. I picked it up one day with a view of burning it, thinking it the best mode of getting rid of the live stock, but as I passed the cask containing the solution I thought I would try the opposite element; so I stirred up the ingredients and dropped the plant in, letting it remain about three hours. During this time the liquid had become clear, and the plant entirely coated with the sediment. I took it out and put it on the stage in the green house, and when it required water, I watered it with this solution in a clear state. In a very short time it began to show signs of returning life: the shrivelled parts began to swell out—the coating it got by its immersion falling off in flakes. I now shifted it into a large pot, still continuing to water it with the sulphur water, until the fresh earth had become thoroughly impregnated with the sulphur. It now grew rapidly, and became as healthy a plant, and the green as beautiful as I ever saw. The plant is now full of flowers, and has never been affected with the scale since. Having several large cacti that were affected with the scale, and being too large to put in the cask, I gave them about five or six waterings with the same water, and they soon became perfectly clean. I then watered all the cacti I had with the same water, whether clean or no. This is now, as I stated before, two years since. I have not used any sulphur water on any of them since that period, and on examination I find they are all clean and healthy. Therefore I have come to this conclusion, that if the soil the cactus grows in, is impregnated with sulphur, the plant never will become affected with scale, for this reason: the sulphur is taken up by the roots, and thoroughly disseminated through the plant, at the same time rendering the plants unwholesome to the scale.—Robert Meston, *in Horticulturist.*

Tomato plants should be trimmed and not permitted to bear all the fruit that sets upon the bushes.

The Flower Garden—*Bedding out Plants.*—In many parts of the country it is not safe to trust bedding plants from houses or frames to the open garden before the first of June.—We prefer waiting until the weather is settled, the ground well warmed, and all danger of frost over. Then get well-established plants, bed out thickly, water overhead freely in the evenings, and the ground will soon be covered; thinly planted beds look meagre. Among the plants adapted to our summer climate, the *Verbena, Petunia, Scarlet Pelargonium, Heliotrope, Salvia,* and *Lantana,* are prominent. The *Cuphea platycentra, Argeratum cœlestinum, Bouvardia tryphilla,* and *Verona Lindleyana,* are also excellent plants for this purpose. Select pure and brilliant colors, and arrange the masses of each so as to produce the greatest effect. A great variety of plants is not so essential to the formation of glowing flowers as an abundant supply of the best sorts.

Dahlias.—Plant the first and second week of this month, (we seldom plant our principal stock till the latter end;) strong, well-established pot-plants, raised from cuttings, are better than old roots, for a fine show of perfect flowers. Give them plenty of room—at least four feet every way. Turn out of the pots without disturbing the roots, and set a neat stake with the plant, to which it can be secured as growth proceeds.—*Horticulturist.*

Propagation of Fine Roses.—It may not be known to many of our readers, that the fine roses of the Chion varieties may be readily propagated by means of slips. Cut from the well ripened wood, slips three or four inches in length, strip off a part of the foliage, and insert them in clean white sand, placed in pots or boxes. Keep them regularly watered, so that they may not get too dry, and at regular temperature. They strike root very freely.—Some practice covering them with bell glass, but those of most experience do not consider the practice necessary. Ladies may also propagate any of the choice roses desired, by budding in the same manner as fruit trees are budded. It adds much to the beauty of the hardy climbers, to have the main trunk variegated with branches of roses, of different shades of coloring. We strongly commend the practice to those who would thus adorn the shrubbery of the homestead.

A New and Beautiful Tree in Oregon.—Mr. Brooks, writing from Olympia, Oregon, says:—"A strange and beautiful tree has lately been found here, which is from one to seven feet high, with a leaf resembling that of a pear, and the trunk and branches those of an orange. The upper side of the leaf is coated with gum, of the consistency of oil, and it is highly fragrant, the odor resembling that of ripe fruit.—It will be a highly ornamental and desirable addition to our gardens, as it is an evergreen.—*Sci. Am.*

Black Warts.—Black warts on plum trees should be cut out and burned. Should they re-appear, repeat the operation till the evil disappears. But this counsel is not always effectual. We knew a tobacco chewer to cut out a large wart on a plum tree, and taking the quid from his mouth, warm and juicy, applied it to the wound, and on that spot there was no gathering of the wart afterwards.—*N. E. Farmer.*

Worms in Peach Trees.—A North Carolina peach-grower, recommends the application of oil meal pickle to the bottom of peach trees to kill the worm, and says he has found it a safe and certain remedy. He applies a quart, after removing slightly the ground. Too much would undoubtedly kill the tree as well as the worm.

Trees may be trimmed in June, but no large limbs should be cut—and no heavy-heeled boots should be permitted to rest on the limbs and bruise the bark. Let the trimmer wear light slippers, unless he may choose to ascend barefooted.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending May 30, 1854.

Isaac M. Singer, of New York, N. Y., for improvement in sewing machines.

Christian B. Miller, of Wilmington, Del., for improvement in processes for galvanizing metals.

John Murphy, of New York, N. Y., for improvement in the process of treating gutta percha.

Chas. T. Appleton, of Roxbury, Mass., for improvement in dyeing processes. Patented in England, Aug. 30, 1853.

Wm. Beal, of Lowell, Mass., for improvement in corn crushers.

J. H. Barsanter, of Philadelphia, Pa., for improvement in knitting machines.

Chas. H. Bigelow, of Lawrence, Mass., for improved mode of manufacturing turbine wheels.

John Brown, of New York, N.Y., for improvement in hot water apparatus.

Abel Brearer, of Saugatuck, Conn., for improvement in fastening the discs and rims of car wheels.

J. H. Farchild, of Jericho, Vt., for improvement in hooks and eyes.

Charles Gregg, of Brooklyn, N. Y., for improvement in vices, or chucks, for holding cylindrical bodies.

J. Harraday, of New York, N. Y., for improved machine for cutting out cloth. Patented in England, Jan. 20, 1854.

Silas A. Holmes, of Brooklyn, N. Y., for improvement in cameras for taking stereoscope or other daguerreotypes.

Carmi Hobson, of Hannibal, Mo., for improved stove machine.

Thos. J. Jarrett, of Horsham, Pa., for improvement in hay elevators.

Geo. Neilson, of Boston, Mass., for improvement in ventilating window for railroad car.

J. R. Pierce, of Castile, N. Y., for improvement in neck yokes.

D. Pool, of Mt. Carmel, Ill., for improvement in quartz crushers.

E. M. Ray, of Providence, R. I., for improvement in knitting machines.

M. W. Stevens and E. G. Kinsley, of Stoughton, Mass., for improvement in sewing machines.

Robert S. Thomas, of Wilmington, N. C., for improved typography.

Benj. C. Vanduzen, of Cincinnati, O., assignor to John Martin and Benj. C. Vanduzen, for improvement in furnace grate bars.

Wm. Wiley, of New London, Conn., assignor to Jonathan Whipple, Jr., of Hopedale, Conn., for improvement in self-acting nipper blocks.

ADDITIONAL IMPROVEMENT.

Oldin Nichols, of Lowell, Mass., for improvement in grinding-mills. Patented Oct. 12, '52.

A NEW RAILROAD BRAKE.

The Paris correspondent of the New York *Tribune* says:—M. Andraud has just invented a new railroad brake, which consists in a strong metallic reservoir, holding about 150 to 180 quarts. This reservoir is filled with compressed air, of eight or ten atmospheres, by means of proper pumps, which are worked by the locomotive. The reservoir is provided with a manometer, safety-valve, and a proper stop-cock, and so arranged and situated that the engineer can easily manage and observe any part of it. When a special person is employed to superintend the apparatus, it can be placed upon the tender. Every car is to be provided with a tube of an inch or more in diameter, each tube having on both ends elastic tubes, by means of which the tubes of each car can be connected with those of the other cars, so as to form a continuous communication with the air reservoir. Each car is furnished with two cylinders of five inches diameter, which are placed below and on each side of the car body. Each cylinder has a piston, to the ends of which the brakes are attached; the cylinders are connected with the long conducting tubes, and when the air is let into the cylinders, their pistons are pushed out, and force the brake against the wheels. When the air is stopped off, a spring or some elastic fixture withdraws again the brake from the wheels. The chief brakeman at the reservoir, who manages the apparatus, can, by a single turn of the stop-cock, act at once upon all the brakes at any moment's warning, which may be given by means of an electro-magnetic signal from any car in the train. The brakeman has only to keep his reservoir always properly charged, as the manometer indicates. M. Andraud calculates the expenses thus: The reservoir and air-pump, placed on the locomotive or tender, $1,000; the apparatus, including the brakes attached to each car, $140.

The use of steam has been proposed for the same purpose and in a similar manner, but the unavoidable condensation of the steam, the filling up of the cylinders with condensed water, and the liability of bursting the tube in cold weather, are sufficient inconveniences to prevent its use. Condensed air is no doubt much preferable.

A Mammoth Vessel in the Upper Lakes.—The Cleveland *Daily Herald* says:—"The ship 'Canada' of Buffalo, is in port here, to-day for the first time. She is owned by Messrs. Walker and Bantam, and is under command of Captain Bantam. Her dimensions are—length of keel, 208 feet; breadth of beam, 32 feet; depth of hold, 14 feet; capacity, 1,100 tons. Last year, she carried at one time, 50,000 bushels of oats, and at another, 40,000 bushels of wheat. She brought up a deck load, four of the largest size passenger cars; and is now loading for Chicago with 800 tons of coal and 300 tons merchandise.

English Orders for American Ships.—The Liverpool Courier, of May 12th, says:—"Capt. McKay, brother of the celebrated ship-builder, takes his departure in the steamer America for Boston this afternoon. Since his arrival here in the Lightning, he has made arrangements for his brother to build for different Liverpool houses nearly £200,000 worth of shipping, a pretty good specimen of the business habits of the enterprising Yankee."

LOCOMOTIVES FOR HIGH GRADES.

The high prize offered by the Austrian Government for the locomotive best constructed to overcome the high grades of the Sommering Mountain, has created quite an emulation among inventors; but all the improvements have tended more or less to increasing the size of the locomotive. M. Andraud seems to be the only one who has left the old beaten track, and invented a locomotive which promises to answer the purpose fully. He only changes the driving-wheels; all the other parts of the locomotive remain the same as they are in use at present. This machine has six wheels. The drivers are placed in the center. The rims of the drivers are very broad, much more so than those commonly in use. The part of the rim which projects considerably beyond the ordinary rail is striated. This is all the change he makes in the locomotive. Where there is a considerable grade, which requires a much greater power to overcome it, he employs a wooden rail, which he places on the outside and contiguous to the rails, of about five or six inches in width, rising a little above the surface of the iron rail, so that the striated portion of the drivers must impinge upon it. The striated part of the driving wheels, and the wooden rails, are the only mechanical means with which M. Andraud proposes to overcome even much higher grades than have hitherto been attempted. The wheels are only put into action when their assistance is required. On straight lines the wooden rails would be placed on both sides of the iron rails; in curves of small radius, on the outside of the inner rail of the curve. The practicability of Mr. Andraud's invention is generally admitted, and he will no doubt obtain permission to experiment on some Government road with higher grades.

Treatment of Persons Struck by Lightning.—E. Merrium, the meteorologist, of Brooklyn, renews the recommendation to apply cold water freely to persons who have been struck by lightning. He says:—"In all cases where persons are struck down by lightning, use cold water on the body for hours; do not be discouraged if immediate success is not attained; continue to persevere, and if, after three or four hours' drenching, animation is not restored, add salt to the water and continue the drenching. I have an account of a person struck down by lightning on Staten Island several years ago, who was restored after two or three hours' drenching with cold water. This case alone is sufficient to prompt to exertions in all cases beyond the time usually devoted to restoration of animation in cases where persons have been struck down by lightning."—*Sci. Am.*

The Universal Exhibition of 1855 at Paris.—The *Moniteur* publishes at last the general regulations of the Universal Exhibition, which are very liberal. It will commence on the 1st of May, and end the 31st of October, 1855.

Foreign Governments are invited to appoint Committees, to whom the articles to be exhibited here to be submitted for examination.—The French and foreign articles will be received at the Palais de l'Exposition from the 15th of January until the 15th of March, 1855.

The foreign articles will be forwarded and returned at the expense of the State from and to the seaports of France, duty free. The prices of articles can be affixed. The articles of each nation are exhibited together. Inventions and designs are protected from piracy.

Safety Whiffletrees.—H. E. Pardee, of Brewerton, S. C., has taken measures to secure a patent for an improvement in safety whiffletrees, the nature of which consists in attaching the traces of the harness to the ends of horizontal sliding rods, which are so attached to a pair of self-adjusting levers crossed and united together near the centre of their length by a fulcrum-pin, and at their upper ends by a forked strap leading up to the driver, that by pulling this strap the traces can be slipped off the ends of the rods, and the horse instantly separated from the vehicle.—*Sci. Am.*

Domestic Economy.

Gooseberry-Fool.—Put the fruit into a stone jar, with some good Lisbon sugar; set the jar on a stove, or in a saucepan of water over the fire; if the former, a large spoonful of water should be added to the fruit. When it is done enough to pulp, press it through a cullender; have ready a teacupful of new milk and the same quantity of raw cream boiled together, and left to be cold; then sweeten pretty well with fine sugar, and mix the pulp by degrees with it; or, mix equal proportions of gooseberry and custard.

To Mend Broken China.—Take unslaked lime, made fine by pounding or grinding, which mix with the white of an egg to the consistence of starch or paint; thoroughly cleanse and dry the edges to be united, then apply the mixture to the parts to be cemented, place them together firmly, and let them become perfectly dry. Articles thus mended can be handled or washed without injury.

Dyspepsia Bread.—Three quarts of unbolted wheat meal; 1 quart of soft warm water; a gill of fresh yeast, a gill of molasses, 1 tea-spoonful of saleratus. This will make two loaves, and should remain in the oven at least two hours. It will need from eight to twelve hours to rise.

To Bleach Straw.—Straw may be bleached by putting it in a cask into which a few brimstone matches are placed lighted. The same effect may be produced by dipping the straw into chloride of lime dissolved in water.

In frosty weather, double care is needed not to crack glass or china by using the water too hot.

Educational.

[Written for Moore's Rural New-Yorker.]

"I CAN'T SPARE HIM."

"I CAN'T SPARE HIM,—don't see how I could get along without him." Well, you *can't* spare him very well. You have got wood to chop, ground to plow, grain to sow, corn to plant, &c., &c., and you *can't* spare the boy. These aforementioned items are to be attended to, rather than your son should spend a few years at Seminary or College, preparing himself to take a position among men—qualifying himself to become eminently useful. You "never had much of a chance," and you have always *got along*." Yes, you had a good constitution, and have toiled long and hard, and have accumulated something. *You* never have relished the rich feasts, the intellectual repasts, which some have seemed to *revel* in, and you see no necessity for it. It's of some importance to accumulate money—sordid dross—earthly pelf—your boy must help you. He must be educated in the mysteries of money making—such mysteries as you possess a knowledge of. Certainly, you wish him to learn to "read, and write, and cipher!"—learn to write his own name legibly, compute interest, so as "*not to get cheated*," and his *education* is *finished!*"

Must have money out at interest, stock in a Railroad or Bank, but *what for?* O, you want to start your son fairly in life, and *leave* him a handsome property. This is the highest hope you have for him! *Leave* him property! but suppose he *should die first!*—the Death-Angel should smite him, and leave you alive—could you "*spare him*" *then?*

What then would be your aim in amassing treasures? By a judicious use, you may possess more earthly comfort. But by whose goodness do you receive so bountifully of earth's fruits and earthly enjoyments? The same who gave your son a *soul*—a mind. He has given you the means whereby you may cultivate that mind—enlarge its capacity for enjoyment, not only on earth, but in Heaven. You will be responsible to the Author of mind for the improvement and increase of the little given you to cultivate. You are to set the ball in motion—to give *direction* as well as motion. That mind is to progress infinitely. Its moral and intellectual character are forever to be increased.

Earth is the vestibule—here we are to lay off, to leave behind this mould of clay, and the spirit part alone enters the golden gate. You are caring for the body, and feed, pamper and clothe it; but what are you doing for the deathless mind? Remember, the Lord of the Vineyard must receive his own with *usury*.

And now, my young friend, a word to you. If you are one of that class ("Their name is Legion") who "can't be spared"—if time and money are not furnished you, with which to improve the facilities offered to all for obtaining an education—

> "Never give up! it is wiser and better
> Always to hope, than once to despair;
> Fling off the load of doubt's cankering fetter,
> And break the dark spell of tyrannical care.
>
> "Never give up! or the burden may sink you,—
> Providence kindly has mingled the cup,
> And in all trials or troubles, bethink you,
> The watchword of life must be, Never give up!"

Let every chip which flies from that log you are chopping, furnish a thought—each furrow you turn *be deep;* use the plow of study, and plow a deep wide furrow in the field of science. Don't study superficially, nor let a stone throw the plow out the furrow—a difficulty, something blind, perplexing, make you cease study. If the plow is thrown out, "back up and take a new hold"—don't half plow it. Conquer all obstacles—you *can!*—make everything yield to the power of mind. Be taught by Nature. Buy a four cent pencil and some paper, and when your "horses are puffing," secure that last thought—add another to it, and another, and keep adding. They will continue to come with accelerated velocity. Suppose they *are* detached. This planetary system is composed of detached bodies. Is it any the less magnificent? Cull the richest thoughts from the best authors you can get—make them your own—Adorn and beautify them to suit your taste. Burn out the candles and oil. Don't let sloth and love of ease overcome these desires. Once in the habit of thinking, of concentrating your powers on a particular subject, and it becomes easy. You *must* labor. "Things breed thoughts." Pluck hearty from the "grey old boulder," and let the farm-sounds make music to your soul. You'll be happy. The "Old Farm" won't be able to hold you. You will *have* to be "spared." The "Sire" will "spare" you. CHARLIE CHESTNUT.

WHAT is righteousness, what is justice, but to give a hearing to every opinion, and to listen to the arguments by which it may be supported; to allow to truth wherever it may be found, the opportunity to disclose itself; to grant to all the liberty of free discussion.—*Prof. Vinet.*

MELTED snow produces about one-eighth of its bulk of water; hence snow two feet deep produces three inches of water when thawed.

OREGON — HER EDUCATIONAL PROSPECTS.

IT would be a bad omen, indeed, for Oregon, if—with a population not much short of 40,000, and still increasing at an unprecedented rate, and fast settling into the order of a republican State—no adequate provision had been made for the intellectual cultivation of her people.

From the earliest settlement of Americans here, however, there has been a felt want of the means of educating the youth. A few, at least, in every class of society have manifestly been deeply impressed with the importance, not only to this people, but to the world, of establishing upon the civilization that is to be developed upon the Pacific coast, purity, liberality and intelligence. The most praiseworthy exertions have consequently been put forth in various quarters, for the establishment of permanent and efficient institutions of learning.—These exertions, in spite of the difficulties incident to all new countries, have been so far crowned with success, that Oregon will now compare favorably with any State in the Union in respect to its schools and educational facilities—considering its age and position. Indeed, few of the old States have accomplished so much for the cause of education, within the first twenty years of their settlement, and the first eight of their civil and political existence, as Oregon. The Methodist Episcopal Church have three flourishing academies now in operation, and a fourth soon to go into operation. The Willamettee University, chartered last winter, and located in Salem, is also under the direction of that body, and a faculty will soon be organized, and ample facilities provided for a full collegiate course.

The Baptists have also a flourishing school in this place, under a charter which embraces all the powers and provisions of a college.—They have now a permanent teacher, and already afford to young men the advantages of collegiate education. Their institution, called the Oregon City College, has received a donation of a tract of land near this place, and mostly free from financial embarrassment, bids fair to be a source of much good to the territory.

There are also two institutions to which the Congregationalists are generally friendly, but which are really under the direction and control of no particular denomination of Christians. These are the *Tualatin Academy and Pacific University*, and the *Clackamas County Female Seminary*. The former is an Academy with Collegiate powers, and a professor already at work in the collegiate department.

The Episcopalians are also making a move toward the establishment of a Seminary or College for the education of young men. The Campbellites are making liberal provision for the immediate establishment of a high school for their denomination.

In addition to these, there must be taken into consideration the village and neighborhood schools, besides many private or family schools, the number of which is not easily ascertained.

There is a school fund, providing for the support and regulation of public schools, in every County; but the sparseness of the country population, and their mixed character—having come from various and different parts of our Union and the world, and being comparatively strangers to each other—have rendered its provisions, as yet, of comparatively little use. Still, it is an evidence of a fruitful interest in the cause of education.

The schools, so far as I know, are well provided with books, of the very best kinds. The latest and best publications of your New York publishers have been introduced, and are generally used.

The public sentiment, however, notwithstanding all that has been and is being done, will not bear a high standard of scholarship—one at least that requires some years and considerable expense to reach. Much of the interest felt in education, it must be confessed, grows out of considerations of its *practical*, immediate utility. An education is deemed rather as a means of business and of gain, than as a means of ennobling and refining human nature. Education, carried on according to the prevalent idea here, would, after one or two generations, provide only the qualifications of a nation of shopkeepers.—*Cor. N.Y. Times*, March 9, 1854.

MASSACHUSETTS SCHOOL STATISTICS.

THE following school returns furnish decisive evidence of the continued advance of our common school system, in proportion to our increasing population and wealth; and nothing shows more conclusively the interest of a people in any public object, or their real estimate of its value, than the amount of money they regularly pay for its support through voluntary taxation. Tried by this rule there can be no general diminution of interest or sense of failure in respect to our public schools; they have been sustained with increasing liberality. The amount of money by tax for the support of schools during the past year, was larger than in any previous year by more than $50,000.

The aggregate of appropriations by all the cities and towns of money raised by taxes for the school year of 1851-2, was $910,216; and for the school year 1852-3, the aggregate was $963,631, an increase of $53,415 in one year.

The amount raised by tax for the school year of 1842-3 was $510,590; the amount for the last year was $963,631, an increase of $453,041, or nearly eighty-nine per cent. in ten years.

The average increase for ten years past of appropriations of school money raised by tax, has been $45,304, per year.

The sum raised for 1842-3 was an average to each person of the whole population, according to the census of 1840, of sixty-nine cents, while the sum raised for 1852-3 was an average to each person of the population, according to the census of 1850, of ninety-seven cents—an advance of twenty-eight cents to every man, woman and child in the state.

The population of the state from 1840 to 1850 increased thirty-five per cent., while the increase of appropriations for the last ten years has been eighty-nine per cent.—*Extract from Mass. School Report.*

THE BOBOLINK, OR RICE-BIRD.

EVERY school-boy of the Northern States will recognize in the above bird the portrait of a familiar friend, although he may not recognize the ear of grain on which this Bobolinkship happens to be perched; while on the other hand, the Southerner will recognize the grain but not the bird, in consequence of his having donned a "coat of many colors," different from the sober brown in which he is wont to visit those warm latitudes—not as a Northern, one of the merriest spring warblers—but as a greedy gormandizer, and a great destroyer of the tender young rice crop, on a stalk of which he is represented as standing, in the cut.

Among us, this warbler is greeted with a welcome scarcely exceeded by that given to the Robin, and he is equally as secure from all harm, except from brainless and inhuman sportsmen, and wanton boys, such as Shakspeare describes when he says:

> "The man that hath not music in himself,
> Nor is not moved with concord of sweet sounds,
> Is fit for treasons, stratagems and spoils;
> The motions of his spirit are dull as night,
> And his affections dark as Erebus:
> Let no such man be trusted."

At the South he is regarded as a pest to the rice fields, and his kind are slain by thousands, both because they are a nuisance while living, and a rich and dainty morsel for the epicure when killed. To see the Bobolink hovering over the tall grass of the meadows, rising and falling as the waving sedge on which he perches is swayed by the wind, and pouring forth such a gush of melody as is equaled by very few of our wild-wood songsters, it requires a considerable stretch of faith to believe that when they become gregarious, and inhabit the warmer climates of the South, at such seasons as preclude their living here, they are anything but elegant and harmless songsters. But so it is, and it proves that birds as well as men are to some extent the creatures of external circumstances. The individual who during a sunny day in June wanders in the fields, and listens to a Bobolink—who rebukes the wanton gunner that lets off a blunderbuss at the songster—who regales himself on strawberries and cream at that season, and would no more think of eating a Bobolink than he would think of eating the sacred bird of Jove, goes South and eats his singing friend in the shape of a Rice bird, with the relentless jaws of a cannibal. It is, perhaps, the bird's fault rather than the man's, for if he had not forsaken his gamut, and betaken himself to gluttony, he would not at last be baked in a pie.

Useful Olio.

IMPORTANCE OF THE COMPASS.

CAPTAINS of ocean steamers differ considerably in their attention to exactness in compasses. Good compasses are doubtless furnished to all vessels of this important class; but the very best compass may be rendered worse than useless, by a disregard of the petty circumstances on board that derange its action. Captain Shannon related to us a curious instance of a derangement in the compass, which had since rendered him punctiliously cautious. He had left Halifax with his vessel on the homeward bound voyage; it was during one of the cold winter months; when fogs prevailed on the American coast. His directions at night to the officers of the watch were to run for a point thirty miles eastward of Newfoundland, so as to make sure of keeping clear of its rock-bound shores; and the point of the compass that would lead in this required direction was fixed upon. On coming on deck in the gray of the morning, what was his horror on seeing that the ship had just entered a small bay, and seemed about to be dashed in pieces on the lofty precipices that revealed themselves thro' the mist. By instantaneously shouting orders to the man at the wheel, and by reversing the engines, he barely saved the vessel from destruction. After some trouble, it was pulled out to deep water. His first impression, of course, was that the compass had been neglected. But to his surprise, he found that his orders in this respect had been exactly followed.

The head of the vessel had been kept in the direction which, by compass, should have led to the open sea, thirty miles from land, and yet here it was, running full in shore. To all concerned, the deviations seemed perfectly magical—not on any ordinary principle to be accounted for. The truth at length dawned on the Captain. The error must have arisen from some local derangement of the compass. He caused all the compasses in the ship to be ranged on deck; and soon it was perceived that no two agreed. The seat of the disorder was soon ascertained to be a certain spot close to the funnel of the stove of the saloon. Could this funnel be the cause? It was of brass, and had never before shown any power of distracting the needle. On looking into it, however, the Captain discovered that at Halifax, a new iron tube had been put inside the brass one, without his knowledge, and the circumstance had never been mentioned to him. There, in that paltry iron tube, was the whole cause of the derangement, "which I speedily," added Captain Shannon, "made to shift its quarters." How near was thus a fine vessel being wrecked, from a petty circumstance which no one could have previously dreamt of; and it may be said how many first class steamers, assumed to be diverted toward rocks by currents, may have been led to destruction from causes equally trivial.—*Chambers' Journal*

No man who has once heartily and wholly laughed, can be altogether and irredeemably depraved.—*Carlyle.*

DISCARD jealousy, for it brings unhappiness, and makes him who harbors it ever wretched.

THE AROMA-BALM.

THIS beautiful and highly aromatic tree is a native plant of Oregon. The leaf is somewhat like the pear; the trunk and branches resemble the orange tree; the flower, the white jessamine. It is found in small quantities in several localities of the Willamette valley, but in greater abundance at the foot of the Cascade mountains, north-west of Mt. Hood. It is destined to make more of a stir among the chemists and botanists of this age than one might at first imagine. What seems to attract the most attention is its peculiarly pleasant and odoriferous smell, a few branches of it giving a delightful fragrance to the parlor or other apartments. The leaf has a sweetish, slightly pungent taste, and the branch differs little in this respect.

Its medicinal properties have not as yet been tested, but we learn that steps have been taken, by persons in this city, towards having this done immediately, by scientific men in New York City. The nature, virtues, &c., of the leaf, flower, trunk and roots, are to be thoroughly investigated. As to the quality of the perfume, little doubt remains—it is decidedly a rich one, and nothing is now left to accomplish, but to carry out the plans already in contemplation. Many are very sanguine of its complete success as regards its rare fragrance, either in its natural state or as an oil. Its medicinal healing powers are thought to be of a superior nature.

The tree grows to a height of eight or nine feet, but is more frequently found of smaller sizes. It is a beautiful evergreen, and will be of intrinsic value to place around our homes as ornaments. Some in our city, have already commenced this elegant addition to their former improvements.—*Oregon Spectator.*

THE OLDEST BOOK in the United States, it is said, is a manuscript Bible in the possession of Dr. Witherspoon, of Alabama, written over a *thousand years ago!* He describes it as follows:—"The book is strongly bound in boards of the old English oak, and with thongs, by which the leaves are also well bound together. The leaves are entirely made of parchment, of a most superior quality, of fineness and smoothness little inferior to the best satin. The pages are all ruled with great accuracy, and written with great uniformity and beauty in the old German text hand, and divided off into chapters and verses.

The first chapter of every book in the Bible is written with a large capital of inimitable beauty, and splendidly illuminated with red, blue and black ink, still in vivid colors; and no two of the capital letters in the book are precisely alike."

PLAINS OF CHALDEA.—Layard says that these plains produce some of the finest fruit in the world. A very delicious peach has lately been introduced into England, which has created a good deal of excitement among nurserymen. The plains in the spring of the year are covered with gorgeous flowers. Truffles grow there in great abundance and are quite extensively used as an article of food.

The hanging gardens of Babylon, Layard says, were no fiction. He has found pictured representations of them in his researches.

Sunday Reading.

SABBATH EVENING.

> Now the Sabbath light is dying;
> Fading from the world away,
> While the autumn winds are sighing
> Farewells to departing day;
> And a blessed calm is stealing
> Pricelessly on every thing;
> While the solemn night revealing
> Silently its dusky wing,
> Folds it up all earthly beauty
> In its dark and chill embrace;
> Thicker, faster come the shadows,
> Softly from each hiding place,
>
> I know a home where shadows gather,
> *Deeper* than the *evening* shade;
> Where a husband and a father,
> In his winding sheet is laid,
> Death hath laid his icy finger
> On the old man's weary eyes,
> But the morning light hath touched them,
> Opened them in Paradise!
> To the Sabbath of the Holy,
> God hath led his trembling feet,
> He who loves the meek and lowly
> Grants to them a royal seat.
>
> At His heavenly table feeds them,
> Wipes the tear drops from their eyes,
> And in tender pastures leads them,
> Filling them with rich supplies.
> There Death's Angel shroudeth never
> Loving hearts, like mists of even,
> And God's ransomed ones shall ever
> See the light and bliss of Heaven. EDITH.

SLIPPERY PLACES.

"LET him that thinketh he standeth take heed lest he fall," is a solemn and sacred admonition; and the frequent disappearance of our fellow men beneath the tide, is a forcible commentary upon the truth. Sometimes stumbling high and jubilant upon what seems a lofty and safe pedestal, the fatal plunge is all the deeper and more sudden. Sometimes occupying a position upon a lower platform, but one of broader dimensions, and apparently secure foundation, the treacherous planks give way beneath his feet, or he walks off the edge of it unaware. Sometimes he trends foolishly, and in a spirit of bravado, dangerous ground, just to show the power he possesses over time and circumstances, and sinks unnecessarily. Sometimes, led from his path through dangerous places, full of pitfalls and man-traps, he becomes indifferent to danger, and falls at last unconsciously, like a man walking in his sleep.

By day and by night—on the broad highway of life and in the by-lanes and pathways—in the crowded marts and in the waste places of the wide world, the evil spirit and his potent ministers, man's appetites and passions unbridled or misdirected, are leading him wider and wider astray.

Prominent among the fiends, stalks forth Intemperance. His victims are reckoned by the myriad, and the altars of their sacrifice are erected in all places. From the magnificent hotel, the gorgeous gin palace, the splendidly furnished saloon, down, down through all grades of the traffick, to the "Tom all Alone" and the dark hole in the corner of some tumble down old mill, the demon seizes on and drags his prey to perdition.

The love of gaming, the pursuit of nobler-tored pleasures, habits of idleness and repugnance to manual labor, false pretences in appearing higher, richer, nobler than we are, false pride causing us to blush at our own or our family's defects, false delicacy in concealing from ourselves, or those in whom we ought to confide, a mis-step or a wrong, all go to make up the great account!

As we look back over the long vista of the past, how many places are left vacant, and mocking shadows occupying the spots where once stood noble structures! What guaranty have we that our own fate may not be similar, except in eternal vigilance over our thoughts and actions; a careful prompting of our good, and an eternal guard over our bad impulses; and a constant enforcement of the admonition in our own case, "Let him that thinketh he standeth take heed lest he fall?"

DIVINITY OF CHRIST.—Two gentlemen were once engaged in a discussion on the divinity of Christ. One of them, who argued against it, said, "If it were true, it certainly would have been expressed in more clear and unequivocal terms." "Well," said the other, "admitting that you believed it, were authorized to use your language, how would you express the doctrine, to make it satisfactory and indubitable?" "I would say," replied the first, "that Jesus Christ is the *true God*." "You are happy," rejoined the other, "in the choice of your words, for you have happened to hit upon the very words of inspiration." St. John, speaking of Christ, says, "This the *true God* and eternal life!"

A RICH man once asked the poet Sadi why the learned were so often seen at the doors of the wealthy, while the wealthy were never seen entering the portals of the learned. "It is," said Sadi, "because learned men know the value of riches, but the rich are ignorant of the value of knowledge."

THE Scripture is unto us what the star was unto the wise men; but if we spend our time in gazing upon it, admiring its splendor, without being led to Christ by it, the use of it will be lost to us.

Miscellaneous.

THE LIFE-CLOCK.

TRANSLATED FROM THE GERMAN.

THERE is a little mystic clock,
No human eye has seen;
That healeth us—that healeth on,
From morning until e'en.
And when the soul is wrapped in sleep,
And heareth not a sound,
It ticks and ticks the live-long night,
And never runneth down.

O wondrous is the work of art
Which tells the passing hour,
But yet ne'er formed, nor mind conceived
The life-clock's single power.
Not set in gold, nor decked with gems,
By pride and wealth possessed;
But rich or poor, or high or low,
Each bears it in his breast.

When life's deep stream, 'mid beds of flowers,
All still and softly glides,
Like the wavelet's step, with a gentle beat,
It warns of passing tides.
When passion nerves the warrior's arm,
For deeds of hate and wrong,
Though heeded not the fearful sound,
The knell is deep and strong.

When eyes in eyes are gazing soft,
And tender words are spoken,
Then fast and wild it rattles on,
As if with love 'twere broken.
Such is the clock that measures life,
Of flesh and spirit blended;
And thus 'twill run within the breast,
Till that strange life is ended.

[Written for Moore's Rural New-Yorker.]

JUNE.—ITS DERIVATION.

"JUNE with its roses—June!
Brightest of summer months—those months of flowers!
First-born of beauty, whose swift-footed hours
Dance to the merry tune
Of birds, and waters, and the pleasant shout
Of childhood on the sunny hills yet'll out."

JUNE, as also the names of all the other months, is traced in its origin, to the old Roman calendar. The French, *juin;* the Italian, *giugno;* the Spanish, *junio;* the Latin, *junius,* are all evidently, derived from the same primitive source. It is doubtful, however, whence and how it received this name, applied to it in the old calendar. The accounts concerning its origin, are various and contradictory. According to VASSIUS, an eminent writer on criticism and philology of the seventeenth century, there are three etymologies of this word. The derivations given by him, are *a junone, a junioribus, a jungendo.* He does not state for which of these he has a preference.

These terms are more fully explained by the distinguished latin poet OVID, in his books called the Fasti. In these books he describes the Roman festivals, their occasions, and the order in which they occurred in the calendar. They are of rare merit and highly esteemed by the learned, for the antiquarian lore contained in them; the rich and copious erudition poured over the sterile indications of the calendar; the mythological worship traced to its source, and the explanation of the mysteries of that theology which peopled all nature with divinities. In this work, the poet represents the goddess JUNO as appearing before him and saying,

"Junius a nostro nomine nomen habet."

But soon HEBE, the goddess of youth, approaches the poet with tears in her eyes and protests against the robbery which has been attempted by her queen and mother. She claims it as her own. In proof of her right, being the guardian divinity of immortal youth, she asserts that when ROMULUS divided the people of Rome into two parts, the elders for counsel; the youth for war; he assigned to the seniors May, *a majoribus,* and to the juniors June, *a junioribus.* The poet was perplexed at this, and his difficulty was heightened by the immediate appearance of another goddess, CONCORDIA. She came not as was her custom, to promote peace and harmony, but to sow an additional seed of discord. She had borrowed the fated apple of her vagrant sister, DISCORDIA, and threw it in their midst.—Her statement was, that the month derived its title from the union between the Romans and Sabines under ROMULUS and TITUS TATIUS.—Her language is,

"Ille meum junctis junius inquit habet."

Such is the poetical tradition. By others the name is traced to JUNIUS BRUTUS, the first who filled the office of Consul. It is stated that on the Calends of this month, he performed a sacrifice to the goddess, which he had vowed to her on account of the expulsion of the Tarquins from Rome. In honor of this sacrificial rite, instituted by him and celebrated on the Caelian Hill, the month was called June. The Anglo-Saxons had several names for this month. They called it "sear-monath," "dry month;" "mid-sumei-monath," "mid summer month;" and "aera-litha-monath," "the earlier mild month," in contradistinction to July.

Truly, in our northern clime, is June the month of flowers. The air is fragrant with rich odors wafted by gentle breezes from flowery beds. The brooklet's flow is full of lively music, as the clear waters leap along, and sparkle in the golden sunlight. The groves send forth a joyous sound, the simple cadence, the wild sweet melody of singing birds, as they flit from branch to branch, of the green forest trees. The sky above is of a lovely blue, and a soft, mellow tint is painted on its overarching surface. The clouds, hiding the sunshine in their fleecy vestments, float on as if guided by some fairy hand to their place of rest.—The light breeze rustling the foliage, makes a wild, dreamy music. The green pastures are covered with snowy flocks and lowing herds.—The luscious strawberry peeps up through the grass on the warm hill-side. Here merry school-children gambol in playful mood, and crush the rich fruit beneath their feet. Or, as with care they pluck the laden stems, they stain their bright faces with crimson juice. A deeper blush mantles the cheek of the half-ripened cherry, as day after day the sun pours its warmth upon the trees. The robin-red-breast wings its flight among the opening boughs, and eyes with heart elate, the rich and crimson fruit.

In the garden the Oriole builds his nest, and the trilling notes of the humming bird are heard. The truant boy stops to catch the idle butterfly of gaudy and ephemeral wing, as it rests upon the flowers by the wayside. The busy bee drinks in its liquid store from every opening rose, and the white clover top.

At evening hour, there is a mild and charming sweetness on the face of heaven. Of a deep blue is the arched vault, and radiant are the stars, as jewels in a crown. The bay of distant watch-dogs falls on the ear. The air is full of insects, whose buzzing notes are lulling to the ear. The water's flow is heard afar, soothing and tranquilizing to the mind. The nightingale ushers her evening song, so full of tenderness and love. And now the deep, low, muttering sound of the thunder's peal is heard rolling, as it were, to the portals of eternity.—Anon the lightning's vivid glare is painted on the sky. Soon comes the rain, a gentle shower, distilling sweetly, love and quietness.

Such are the beauties of June, a soft, mild month; all youthfulness and love. It is the gay and gladsome time of childhood, when the flowers of love are mingled with the roses of beauty. A. J. E.

University of Rochester, 1851.

MARRYING TO SUIT.

MARRYING to suit —— whom? To suit one's self, to suit the old folks, to suit the younger and prouder members of the family, to suit the gossips, the old maids, the scheming mammas, the world in general, or "the rest of mankind?"

It may seem a bold assertion to make, but it is true notwithstanding, that in ninety-nine cases out of every hundred, if a young man marries to suit himself, and is guided by the highest and purest motives in selecting his wife; if he chooses her on a basis of solid qualifications, calculated to secure both his and her happiness in after life, he will be sure to incur the censures, secretly if not openly, of a large part of his intimate acquaintances and friends. "He might have married a woman with twice the fortune," says the prudent money-catching father; "might have obtained a wife moving in a much more exalted circle," says the mother; "his wife is not good looking enough, or refined enough," says the sister; and the brother demurs to the choice, for what he deems some other equally substantial reason. Outsiders also make their comments, and vote the Benedict wonderfully short-sighted; but these grumblings, inside the family and out of it, soon subside after the Gordian knot is fairly tied; and the pair are permitted to settle down upon the old folks' side of the field of life, much to their own ultimate satisfaction and enjoyment. The quiet stream of domestic felicity flows much more smoothly as it proceeds on its course, but it grows deeper and wider year by year. It attracts less the eyes of the world, but it is felt and acknowledged by the immediate parties with a blessing on the day that joined them hand and heart.

There is a sad record of domestic infelicity, and it is swelling momentously day by day; but it is the result of a violation of Heaven's law in the conjugal choice, and not in its fulfillment. The man married for money, for beauty, position, eclat, gratification of the wishes of others; because he was dazzled, pulled up, or for any other motive than to secure a lovable and loving companion on life's rough journey—and he obtained any one but that. "He went a wool gathering and came home shorn." In all cases of the judicious choice of a wife, both parties are benefited, and they are both happier and better, and much more fitted for earth or heaven.

PREVENTIVE.—A correspondent of the London *Times* suggests, as an antidote to the fearful submarine infernal machine contrived by Jacobi, the great Russian chemist, that one or more small steamers, preceded by an efficient dredging and diving apparatus, would effectually combat the evil, by first detecting the obstacle in any required direction, and afterwards cutting the wires of communication with the shore. Jacobi's invention consists of a contrivance with a supply of gunpowder, deposited at the bottom of the harbor, and connected with a galvanic battery on shore. As soon as the keel of a vessel touches this, which approaches the surface, the battery explodes.—Cronstadt harbor is said to be full with such horrors.

CHARGE OF JUDGE McCLURE.

JUDGE MCCLURE, of Pittsburg, in a charge to the Grand Jury lately, spoke of intemperance and crime in the following emphatic manner:

"The Court has been in session since October Term, (Feb. 16,) without intermission, dispatching the criminal business of the county. I have kept a docket and table of contents, time, &c., in my own way, collateral to, and independent of the usual records of the Court, and without wearying your patience with the process I have gone through, I will give the results, which is that, had it not been for the use and abuse of ardent spirits in Allegany county, every case on the October calendar would have been disposed of in one week, (and the District Attorney confirms this statement,) with the utmost ease, and the cases would have been of a trifling nature. There would not have been one case in the Oyer and Terminer.

"I shall cease to prate any more to Grand Juries about this omnipotent parent of crime, alcohol. If a century of imbecile legislation has not sufficed to convince reasonable men; if crimes and poverty before their faces; if a ceaseless drain upon their charity, from destitution, caused by drink; if their increased taxes; if men's eyes and ears will not convince; if the evidence of our senses will not enlighten our understanding to this behalf, and cause in the community corresponding acts, prompted by duty and common sense, then to talk on this theme longer here, is time thrown away. If society chooses to indulge in this luxury of woe, and in the causes that produce it, I have no more to say, for society has the power to select its own peculiar enjoyments, and of indulging therein. Its right to do so is more questionable."

BONAPARTE'S POVERTY IN EARLY LIFE.

M. THIERS, in his history of the Consulate, recites some very strange and previously unknown particulars respecting the early life and penury of Napoleon Bonaparte. It appears that after he had obtained a subaltern's commission in the French service, by his skill and daring at Toulon, he lived some time in Paris in obscure lodgings, and in such extreme poverty that he was often without the means of paying 10 sous (10 cents) for his dinner, and often went without any at all. He was under the necessity of borrowing small sums, and even worn-out clothes, from his acquaintances. He and his brother Louis, afterwards King of Holland, had at one time, only a coat between them, so that the brothers could only go out alternately, time about. At this crisis, the chief benefactor of the future Emperor and conqueror, "at whose mighty name the world grew pale," was the actor Talma, who often gave him food and money. Napoleon's face, afterwards so famed for its classical mould, was during that period of starvation, sharp and angular in its lineaments, with projecting cheek bones. His meagre fare brought on an unpleasant and unsightly cutaneous disease, and of a type so virulent and malignant, that it took all the skill and assiduity of his accomplished physician, Corvisart, to expel it, after a duration of more than ten years.

The squalid beggar then, the splendid Emperor afterwards—the threadbare habiliments and Imperial mantle—the meagre food and gorgeous banquet—the friendship of a poor actor, the homage and terror of the world—an exile and prisoner. Such are the ups and downs of this changeful life; such are the lights and shadows of the great and mighty.

GIVE ME DRINK!—Mr. M'Leod, an English writer, puts the following language in the mouths of those who visit the runseller's den:

'There's my money—give me drink. There's my clothing and my food—give me drink! There's the clothing, food and fire of my wife and children—give me drink! There's the education of the family and the peace of the house—give me drink! There's the rent I have robbed from my landlord, fees I have robbed from the schoolmaster, and innumerable articles I have robbed from the shop-keeper—give me drink! Pour me out drink for more, I will yet pay for it! There's my health of body, and peace of mind. There's my character as a man, and my profession as a Christian; I give up all—give me drink! More yet I have to give! There's my heavenly inheritance and the eternal friendship of the Redeemer. There—there is all hope of salvation! I give my God! I resign all; all that is great, good and glorious in the universe, I resign forever, that I may be—DRUNK.

FRANKLIN AND WHITEFIELD.—The acquaintance commenced when the claims of the orphan-house were pleaded in Philadelphia.—Franklin, though he approved of the object, refused to contribute to it when applied to in private, because he disapproved of the situation. He went to hear Whitefield preach, resolved to give nothing. He had, however, in his pocket, a handful of coppers, three or four dollars in silver, and five pistoles in gold. As the sermon began to kindle, Franklin began to soften, and was willing to give the coppers. The next stroke won the silver, and the finishing one was so admirable, he says, "that I emptied my purse wholly into the collector's dish, gold and all."—*Whitefield's Life.*

INVENTIVE GENIUS.—It has been said that we are indebted for the important invention in the steam-engine, termed *hand-gear,* by which its valves or cocks are worked by the machine itself, to an *idle* boy of the name of Humphrey Potter, who, being employed to stop and open a valve, saw that he could save himself the trouble of attending and watching it, by fixing a plug upon a part of the machine which came to the place at the proper time, in consequence of general movement. If this anecdote be true, what does it prove? That Humphrey Potter might be very idle, but that he was, at the same time, very ingenious. It was a contrivance, not the result of mere accident, but of some observation and successful experiment.

LETTER FROM A FARMER'S WIFE.

Reply to "A Purse for the Wife," "Purses Rightly Distributed," &c., &c.

MY DEAR RURAL:—As my letter "About Wives with Separate Interests from their Husbands," in the paper of March 4th, seems to have been misunderstood, I must send you something more on the subject. Your correspondents are contending about *purses,* and who shall carry them, of which I said nothing, for I care not whether there be one purse or two, if there is but *one interest* to serve. If a man choose that his wife attend to supplying indoor wants (as much *his* as hers,) by any special means—by any purse of her own—I will make no objection, though where both are united, *one purse* would surely seem as good as two, and the two are but one in reality.

To "ONE WHO OUGHT TO KNOW," (in the RURAL of March 25th,) I would say that such a man as *he* represents Mr. L. to be—who gets into "a fret" because things go wrong out-of-doors—and allows his "fret" to cross the threshhold with him and make him speak cross words to his wife and little FREDE; such a man, I should think would do well to give his wife "a purse of her own," wherewith to supply her ever-recurring wants. It would, no doubt, save her from many unkind remarks and unpleasant reflections, and sometimes, perhaps, keep him from fretting—two very desirable results, all must allow.

And now his other case. Any wealthy man who gives wife occasion to say, "If I could get a dollar and not let my husband know it, I would like to give it to this benevolent object," should, of course, allow his wife "a purse of her own," for he would surely be too penurious to supply his family with the necessaries of life.

I fully coincide with "ONE WHO DOES KNOW" (in the RURAL of May 20th,) in *his* opinion of Mrs. J. She is certainly a model woman for a farmer's wife—she works for the general fund—the *united interest*—and that is what I have been contending for. It is no matter, I repeat, how many purses there are, if there is but one interest to serve. But it sounds an absurd to hear a woman say, "this is my money, and I shall only appropriate it to such and such purposes," and to make it a point to use up the money because she has it, whether she really needs what she buys or not. This, gentlemen, is the principle against which I combat,—this, and nothing else.

And now, Dear RURAL, let me reply to one of my own sex, who comes out upon me and my letter, in *Arthur's Home Gazette.* "NETTY NETTLE" thinks there are enough to "crush down woman," without those of her own sex lending a hand. Now, nothing was, or could be, farther from my intention than this. I was seeking to point out some of her errors, that she might *lift herself above them.* She says, too, that few women will think they need my hints, and perhaps they will not, yet I can but think, if many would watch more diligently over their own faults, they would find less in their husbands that needed their reproof.—For myself, I am heartily tired of hearing women find so much fault with their husbands; and any true woman, instead of spreading her husband's faults abroad, will rather try to hide them. There should always be an understanding between husband and wife, that they remind each other of their errors, and thus help to perfect each others characters.

There is great complaint made, that husbands will not do many little chores when their wives ask them; and how often do we hear the unpleasant remark—"My slightest wish, before we were married, was attended to, but now it makes no difference how much I want to go any where, or have anything done, I can have no help, I must stay at home, and attend to my wants alone, or leave them unattended to."—Now, we do not say there is no cause for this, but we do say, that not one man in ten, if kindly requested to do any thing about the house, or to serve his wife, will refuse, while if authoritatively commanded, not one in ten will comply. Woman has no right to try to rule. At the marriage altar, we all promise to *love, cherish, and obey,* and where you find a wife who does this, you will, almost always, find a husband, tender, provident, and affectionate as any woman's heart can desire. Though man ought to rule, it should not be tyrannically—yet, I for one, would rather have a husband play the tyrant a little, than act as if he were *hen-pecked,* NETTY'S opinion that I wear "the breeches," to the contrary, notwithstanding.

As to the cases where men are so liberal in every thing but supplying the wants of their own families, I can not too strongly express my indignation at such meanness; and however common they may be, in NETTY'S vicinity, I am glad to be able to say they are very rare here. There is one, however, and he, report says, will not *lend* his wife money to buy dresses for his little girls, but they must wait until their mother can earn the money to pay for them herself. It is not to the wives of such husbands that I have been talking; but this letter is spun out too long already, so I will close by repeating the old Proverb, "Whoever the coat fits, may put it on." A. K. P.

[Written for Moore's Rural New-Yorker.]

MOTHER.

"There is none—
In all this cold and hollow world, no fount
Of deep, unchanging, constant love, like that—
Within a mother's heart."—*Hemans.*

NONE but those who have been deprived of this, the kindest of earthly friends, can ever fully prize the real worth of a mother's love. What love can equal the fond devotion that burns in a mother's heart? Earth has none; no tie so tender, none so strong, none so unchanging, none that glows with such intensity, and none so pure. Her love and influence are like the silent dews of Heaven,—falling gently upon the fruitful soil of the heart, and every tender germ springs up to meet it, as the drooping flower raises its blushing head to catch the genial shower, or glitters in the sparkling dew. If there be but one tender plant, it grows the greener; if but one bright flower, it takes new and more beautiful colors from its parent stem: so if there be but one loved object on which to bestow a mother's care, her affections twine closer and closer around it, till it seems a part of her own being, and she watches over it with increasing fondness and more devoted interest, as she sees her infant blossom expanding into the flower of youth and vigor of age.

Though that fond, devoted mother may long since have been laid away in the silent grave, and the cold clods of the valley lie moldering over her decaying form, yet her influence lives, and it will live forever—throwing its silent and almost invisible charm around the rugged scenes of life, elevating the soul to nobler aspirations and more exalted motives;—it hovers around the infant couch, and breathes its silent power o'er the child, even when his locks are silvered o'er with the frosts of many winters, and his brow wrinkled with age:—it lingers around him like a spirit of the dead, through all the rough paths of life—smoothing every difficulty, and sweetening every bitter draught, and even when he goes down to the silent tomb, the last faint whisper, perhaps, that trembles on his dying lips, is—"*Mother! O, my mother!*" And if ever a guardian angel is permitted to visit earth and watch over the loved ones, left behind, it is the sainted spirit of an affectionate mother,—ever hovering near them with fond delight and clinging love, to guide their wayward steps in the paths of duty, and point the way to Heaven.

Who so fondly as a mother could cherish her infant blossom, and watch beside our infant couch, by night and by day with tireless vigilance, and whose ear was soonest to catch the slightest sound of pleasure or grief? Who anticipated our every want, and soothed our little hearts when they were sad? Who but a fond mother taught us to lisp the evening prayer,

"Now I lay me down to sleep?"

And who told us of God, of Heaven, and the bright angels there, and led our youthful steps in the ways of truth and virtue? When in the land of strangers, and racked upon a bed of pain and languishing disease, who so well as a mother can soothe the aching breast and cool the fevered brow, or smooth the dying pillow and catch the last faint whisper ere the soul takes its eternal flight to the spirit world? But ah! how little we appreciate her kindness and devoted love till *too late.* When the death damps gather around her pallid brow, when the ardent fires of that sparkling eye grow dim, when the mild accents of her familiar voice grow fainter and fainter, as she murmurs forth a prayer to Heaven, invoking a divine blessing on us—and when the last dying whispers fall with crushing weight, and mournful interest on the listening ear, and the soul takes its upward flight—then the startling truth flashes o'er the mind, that we have never known the intrinsic worth of that fond and affectionate mother—now pale and silent, and hushed forever in the long sleep of death. Reader, hast thou a mother? Love her with all the intensity of thy heart, cherish her with thy fondest affections, heed her counsels and instructions, prize her as thou wouldst some rare jewel, and smooth her rough pathway down to the gates of death. Art thou bereft of her? Then canst thou truly mourn! Let the flowers that bloom around her grave, often be watered with the tears of thy affection and sorrow, and ever preserve her hallowed memory fresh and green in thy heart:

"'Tis only when her lips are cold
We mourn with late regret,
'Mid myriad memories of old,
The days forever set!

And not an act—nor look—nor thought—
Against her meek control,
But with a sad remembrance fraught,
Wakes anguish in the soul!"

Southport, N. Y., May, 1854. D. B. A.

ALL the pomp, all the glitter, all the distinctions of life, appear despicable as the playthings of a child, when, amid the sublimities of nature, we commune with God and his works.

MOORE'S RURAL NEW-YORKER

ROCHESTER, JUNE 10, 1854.

A Day in Cleveland.

Dunxo a brief vacation from the office and its constant duties, we last week passed a day very pleasantly in Cleveland, Ohio—the far-famed "Forest City." Though scarcely a year had elapsed since our former visit, the city seemed to have grown wonderfully, and presented many new features. We were surprised at the rapid "progress and improvement" manifested in both business and suburban districts—evincing commendable enterprise and taste on the part of citizens. The numerous substantial business blocks, and elegant residences, recently erected and in process of construction, prove that Clevelanders are "fully up to time," if not in advance of their neighbors in other Western cities remarkable for enterprise and go-aheadativeness.

As we have before said, and printed, Cleveland is a progressive, advantageously located, and beautiful city. In certain respects it is a model worthy the examination and study of strangers—and some of its features might well be imitated by larger and much older towns. Its broad avenues, well lined with shade and ornamental trees—the neatness and taste generally displayed—the fine churches, public buildings and business blocks—and above all, the beautiful private residences, surrounded by lawns, shrubbery and model gardens—at once attract the attention and captivate the fancy of strangers. Unlike those of most cities, the private residences embrace "ample room and verge enough" for comfort and the display of taste in ornamental shrubbery, gardening, etc.,—a prominent and commendable feature. In these and other respects, Euclid street is the finest avenue we ever saw; the wide and deep lots, with fine houses (not *on*, but some fifty or a hundred feet distant from the street,) and beautiful surroundings, present a combination of attractions most desirable, yet rarely realized. Prospect, and several other streets, also present a fine appearance. Strangers visiting Cleveland should tarry long enough to see the above and other notable localities and features.

But with all its beauties, Cleveland has at least one repulsive feature. The idea of lining its public square with from one to four hundred market wagons, three days each week, is *not* over commendable to say the least. It is certainly a pleasant and central location, and may possess other advantages in the eyes of dealers. But to our view, the immediate proximity of lawns and groves, and carts and stands loaded with meat, potatoes, eggs, butter, sour-kroul, sausages, &c., &c., presented a somewhat disagreeable contrast. However, perhaps our taste is at fault in the matter.

Speaking of marketing, we priced a few of the numerous articles on sale, and will add the figures:—Potatoes, $1; Beef and Mutton per quarter, 5 to 6 cents per lb.; Hams, 9 cts.; Butter, 16 cts.; Eggs, 11 cts.; Strawberries, 50 cts. per short quart. In addition to these articles, there were "on sale" all kinds of vegetables in season, fruits, nuts, corn in the ear, sour-krout, butter-milk, an innumerable variety of pedler's goods, *et id omne genus*.

In business affairs Cleveland is most prosperous. Situated upon the lake, the terminus of several railroads, and "backed" by the rich Agricultural region known as the Western Reserve, it possesses peculiar advantages for both commercial and inland trade. The population of the city—including Ohio City, recently "annexed" to Cleveland proper—is some 40,000, and of course rapidly increasing.

During our sojourn we called at several of the newspaper establishments, and were glad to find the "black art" flourishing. The daily and weekly journals of Cleveland are generally well conducted, and have a good circulation. The *Herald* has a very fine printing establishment, with the latest improvements. We passed an hour or two very pleasantly in the office of Brother Brown, of the *Ohio Farmer*. If he don't make *quite* as good a paper as the Rural, he is doing well, and has abundant room to expand in circulation and influence. May his shadow increase!

In the matter of hotels, Cleveland is "furnished." We have aforetime tarried in the city, but never until our recent visit found just *the* place—for the reason, probably, that the Angier House was yet in embryo. It is now complete, however, and is altogether one of the best hotels with which we are acquainted. In selecting a hotel it is generally safest to take a box-ticket—the best—and hence we advise those of our friends visiting Cleveland to stop at the Angier.

Death of Fanny Forrester.—Mrs. Emily C. Judson, wife of the late distinguished Dr. Judson, Baptist Missionary to Burmah, died at Hamilton, Madison Co., in this State, on Thursday, the 1st inst., after a lingering pulmonary illness. Mrs. Judson was better known to the literary world under the name of Fanny Forrester, and was for some years previous to her marriage and missionary labors, a contributor to many of our widely circulating magazines. She was also authoress of several religious and ethical works, principally in the line of books for the Sabbath School. She was greatly beloved by a large circle of friends in private life, and the good she has done will live after her.

Fugitive Slave Sent Back.

As was anticipated, the slave Burns, arrested at Boston, has been remanded to his master, and carried back by him to Virginia. There was no other alternative under the law, as the fugitive was undisputably the slave of the claimant, Col. Suttle.

The excitement at Boston was probably greater on the occasion than has ever been known during the present generation. At two o'clock P. M. on Friday, the 2d inst., Burns was taken from the Court House, and placed in a hollow square of 100 special deputies of the U. S. Marshal—each armed with a cutlass and revolver. The Marines, Infantry, and a detachment of the 4th Artillery, with a nine pounder loaded with grape, under command of Major Ridgely, of the U. S. Army, acted as a special escort, while the procession marched down Court and State streets to the wharf, where the fugitive was put on board a steamer, and conveyed down the harbor until opposite Fort Independence, at which place he was transferred to a U. S. Revenue Cutter, which immediately sailed for Norfolk, Va.

Twenty or thirty thousand people occupied both sides of the streets and buildings along the line of march, from Court Square to Long Wharf, the crowd being kept in check by a cordon of U. S. troops and State Militia, and the procession meanwhile being greeted with groans and hisses, but no outbreak occurring. A truckman attempting to drive through the line of military, had a valuable horse bayonetted and killed. The crowd cried "Shame!" "Shame!" and made a rush toward the place, whereupon Capt. Evans, of the Boston Artillery, greatly excited, ordered his company to fire upon the crowd. Col. Boyd, of the staff, hearing the fatal order, spurred his horse before the company, and countermanded the order, thus preventing the shedding of blood.

The stars and stripes were hung across the streets, draped in mourning, and other evidences of deep feeling manifested by the people. The bells were tolled in many of the cities and villages of New England on the receipt of the intelligence from Boston.

Making Kansas Free Territory.

The Massachusetts Legislature has incorporated an association entitled "The Emigrant Aid Society," with a capital of $5,000,000, for the avowed object of rendering Kansas and Nebraska free Territory. The stock is divided into shares of $100 each, of which not over $4 will be assessed in 1854, and not over $10 in any one year thereafter.

The Society intend to forward at once 20,000 emigrants to Kansas, making contracts with the transportation lines for that purpose; to erect in the Territory a receiving depot, steam saw and grist mills, establish churches and schools, and a weekly newspaper. In this way they have no doubt of forestalling slave holders under the new law, and of vindicating "Squatter Sovereignty" in the right direction.

Kansas is believed to be the Territory on which the battle of freedom must be fought, as Nebraska is so far North as to preclude the probability of its becoming slave territory. Auxiliary societies are being formed in New York, in this, and in other cities, and the probability is, the scheme will be eminently successful. Individuals have pledged themselves to take $10,000 each of the stock as soon as the society is organized, and the matter is regarded very favorably in all the Northern cities. The German emigrants are especially hostile to slavery, and the number coming the present year is unprecedented. The Society anticipate that the rise on their investments, as the country becomes settled, will reimburse all expenses.

Lawless Violence.—A telegraph despatch from Boston, June 3d, says:—"Richard H. Dana, one of the counsel for the fugitive Burns, was struck on the temple, supposed with a sling shot, by some person unknown, while walking last evening to his residence in Cambridge. It is asserted that this assault was instigated by some of the Deputy Marshals, who acted as a guard over Burns, and that the reason for it was some rather personal allusions which Dana made to them on his opening argument.

"Three images were discovered this morning suspended from a flag staff in the Commons.—They bore the following names: B. F. Hallet, Attorney General to the Prince of Darkness; Marshal Freeman, Chief of the Boston ruffians, slave-dealers and blood-hounds; Commissioner Loring, the $10 Jeffreys of 1854.

Railway Casualty.—The Express train on the Great Western (Ca.) Railway, going east, last week Friday, ran over a cow near London, by which the entire train was thrown off the track, and the last three cars, one baggage and two passenger, went down an embankment twelve feet high. Of the second class passengers five men and one woman were instantly killed, and four others so badly wounded that they have since died. One first class passenger, standing on the platform, was also killed, but all those in the cars escaped with little personal injury.

Five hundred barrels of green peas were sent from Norfolk to New York on Wednesday week. The Norfolk Argus says that from about the 20th June to the 20th July, from 2,000 to 2,500 barrels of potatoes will be shipped daily from that city to New York and Philadelphia, together with 300 or 500 barrels of cucumbers, and musk melons, &c.

Fearful Gunpowder Tragedy.

Another casualty occurred last week at Wilmington, Delaware, by which three wagon loads of gunpowder, weighing about five tons, exploded in the street, while on its way to the wharf, from the mills of Messrs. Dupont. There were a thousand or more kegs of powder on these wagons at the time, all of which blew up so simultaneously that it is impossible to tell with which one the casualty originated.

Eight or ten persons, including the teamsters, and fifteen horses were killed by the explosion—houses were shattered in all directions, and six totally demolished. Many persons were severely injured, and several escapes in the demolished houses seem almost miraculous. The beautiful residence of Bishop Lee, and the grounds and shrubbery adjoining, are destroyed. There were in the house at the time two young ladies, nieces of the Bishop, a serving woman, a child, and a colored cook, all of whom escaped with little injury except the latter, who it is feared will lose her sight.

Not less than 600 lights of glass were broken out of the spacious Roman Catholic College of St. Mary's, Delaware Avenue, nearly a mile from the scene of the disaster.

The cause of the accident is, of course, conjectural, but the most reasonable supposition is, that the jarring of the wagons caused the powder to leak from some of the kegs, (which are not always perfectly tight,) and falling upon the road, formed a train which was fired by a spark struck by the horse's shoe coming in contact with the stones. In support of this opinion, it is said that small quantities of powder have frequently been found on the road after the passing of powder wagons.

Congressional.

Washington, May 29.—Senate.—Mr. Gwin gave notice of a joint resolution for the final adjournment of Congress on the 3d of July next.

Mr. Mason, from Committee on Foreign Relations, reported a bill for the relief of destitute American citizens in foreign countries.

The Senate then took up the Indian Appropriation bill. A portion of the amendments were adopted, when the bill was read a third time and passed.

A committee of conference was ordered on the disagreement of the two Houses to amendments of the Deficiency Bill.

House.—Mr. Faulkner moved to suspend the rules to introduce a resolution instructing the Judiciary Committee to inquire into the facts connected with the recent death of James Batchelder, U. S. Deputy Marshal at Boston, who, it is alleged, was murdered on Friday last, while engaged in enforcing the laws of his country against the violent and treasonable mob.

Mr. Shaw, of N. C., spoke against the distribution of the proceeds of the public lands.—When he had concluded the committee rose.

Mr. Walbridge, of N. Y., moved a suspension of the rules, that he might offer a resolution for an adjournment of the two Houses until the 3d of July. Without taking the question, the House adjourned till to-morrow.

May 30.—Senate.—Mr. Adams offered a resolution of inquiry as to the propriety of giving a pension to the widow and children of James Batchelder, who was killed during the slave riot in Boston.

Mr. Sumner objected to its consideration, and it was laid over.

Mr. Chase presented several petitions that the independence of Liberia be recognized.

Mr. Shields introduced a bill granting land to Mississippi, Louisiana and Alabama, for constructing a railroad from New Orleans to Mobile.

House.—On motion of Mr. Pennington, of N. J., the Committee on Commerce were instructed to inquire whether further measures were necessary on the part of Congress for the better security of life and property in cases of wrecks or other disasters to vessels on the coast of New Jersey.

On motion of Mr. May, of Md., the President was requested to communicate to Congress copies of all the correspondence that may have passed between our Minister in Turkey and the State Department.

House went into Committee on the Pacific Railroad Bill, and Mr. Smith, of N. Y., proceeded to address the House in opposition to the bill. His chief opposition to it was, that it was proposed to build the road by government. After some further consideration of the bill, the committee arose.

Mr. Phelps, from the Committee of Conference, reported on the Deficiency Bill.

May 31.—Senate.—After the usual opening of business, Mr. Badger presented the proceedings of a meeting held at Wilmington, in favor of Congress granting an appropriation to improve Cape Fear River.

The resolution of inquiry into the propriety of granting a pension to the widow of Deputy Marshal Batchelder, was passed.

The bill supplementary to the act authorizing Notaries Public to administer oaths, and to take certain oaths and affirmations in certain cases, was passed.

The President's veto of the Insane Land Bill was then taken up.

House.—The Indian Appropriation Bill as passed by the Senate on Monday, was returned to the House and referred to Committee on Ways and Means.

An ineffectual effort was made to report back the bill regulating the pay of Deputy Postmasters.

Mr. Oliver, of Mo., introduced a bill providing for the sale and survey of the public lands in the new territory of Kansas. Also for the establishment of land offices throughout.

House went into Committee, and resumed consideration of the Pacific Railroad Bill.

June 1.—The Senate met informally this morning, and adjourned over to Monday.

House met at 8 A. M., and soon after adjourned over to Monday.

Statistics of Longevity.—1751 persons were taken, all of whom had attained 100 years, and were all living at the same time. In one year they had diminished to 1587, in the second year to 1442, in the third to 1280, in the fourth to 1126, and so on till, out of the original 1751, only 143 reached the age of 120; 14 survived to 130, 12 to 140, and one tough old gentleman actually resisted the effects of time and weather, till he had completed his one hundred and fifteenth year!—*New Quarterly Review.*

News Paragraphs.

☞ A couple of years after her marriage, the present Empress of Russia paid a visit to her father at Berlin. Nicholas, two days after her departure, took post, traveling *incog.*, and arrived at the palace at Berlin one hour before his consort, who was not a little surprised to be welcomed by her husband. It is the only time, it is said, that he indulged in a hearty laugh.

☞ Mr. Wm. H. Lewelling, Inspector of Provisions in Norfolk, Va., being lately called upon to inspect a lot of 14 kegs of lard from North Carolina, discovered in the middle of about 10 of the kegs, deposits of bricks, rocks, billets of heavy wood, and flat-irons! Mr. Lewelling says that this is not the first fraud in lard which he has detected recently.

☞ The *Literary Gazette*, commenting upon the list of births, deaths, and marriages, which appears in the *Times*, observes, that the custom of advertising the marriage of private persons in the newspapers only dates from about a century back. When first practiced it caused much merriment among the wits of the coffee-houses and clubs.

☞ A man named Joseph Campbell, recently died in Campbell county, Geo., at the advanced age of 97. His children, grand-children, and great-grand-children were found to number two hundred and twenty-five; but the most remarkable circumstance was, that the *youngest* of the whole group was his own child.

☞ The largest pane of glass that has yet made its appearance in New York, has taken its place in one of the windows of Taylor's Restaurant establishment, on Broadway. Its dimensions are fifteen feet in height, six feet in breadth, three-quarters of an inch in thickness. It cost one thousand dollars.

☞ The Boston Journal says a revision of the rates of marine insurance, is absolutely necessary to the continued existence of many of the companies in that city,—the recent heavy losses having swallowed up the earnings of some of them, and drawn largely upon the reserved funds of others.

☞ No small suprise, says the London *Globe*, has been created by the removal of the celebrated Whittington stone, from its time-honored site within a few weeks. Whether torn and borne away by ruthless hands is not known, but an inquiry, it is hoped, will be deemed necessary.

☞ The Alexandria Gazette makes this obituary announcement:—"Old 'Uncle Harry,' in the days of Washington one of the Mount Vernon servants, died yesterday, where he had lived many years, at Jones' Point. He was fond of talking of his old master to the day of his death."

☞ The Wheeling Times says Mr. Ellet has arrived in that city, and at once directed his attention to the removal of the obstructions at the bridge. He states that a temporary bridge can be erected on the site of the old one in a short time, that will answer for present uses.

☞ The N. Y. Express has a despatch from Washington, stating that it is confidently expected that Mr. Warren Winslow, bearer of despatches from Madrid, will be sent back immediately, carrying instructions to Mr. Soule to offer One Hundred Millions of dollars for Cuba.

☞ The eclipse was daguerreotyped, in 28 pictures, showing the various phases of the moon's contact, by Mr. Root, the New York artist. These pictures are very interesting and valuable. The sun was made to take his own picture, with his face half concealed, in Detroit.

☞ According to the McKean News, two young men living in the vicinity of Smithport, Pa., are to run a foot race for no unusual prize, viz., the hand of a blooming young woman.—Such a mode of obtaining a wife, will undoubtedly draw a large concourse of spectators.

☞ A little boy, eleven years of age, was poisoned in New York, on Monday week, by drinking a small quantity of brandy, given him by a thoughtless person. The man who did this was held to bail in the sum of $1000, to answer the charge of causing the lad's death.

☞ Queen Isabella of Spain has presented to Capt. Wm. Burrows, of the American bark Zenobia, a splendid massive antique chased silver speaking-trumpet, in attestation of his humane conduct in saving the crew of the Spanish vessel Perseverancia, wrecked off Cape Horn.

☞ The Fredericksburg News of the 22d inst., says that the Joint Worm is playing sad havoc in Carolina and Spottsylvania counties. An intelligent farmer told us on Saturday, that until ten days before, the promise of no unusually large crop had never been better.

☞ The Hamilton (C. W.) Journal of the 19th ult., says that it has, from almost every part of the adjoining country, very favorable accounts of the state of the wheat crop. It is described as seldom having presented a better appearance at this season of the year.

☞ The friends of temperance in Vermont have raised $70,650 toward the $250,000 fund. In addition to this amount, the town of Woodstock has subscribed upwards of $20,000, and large subscriptions are being or have been taken up in many other towns.

☞ The Augusta, Ga., Chronicle, of the 19th ult., says:—We have just been shown a sample of wheat, which was harvested yesterday on the farm of Seaborn Jones, near this city, which will compare favorably with the best Genesee. This is very early.

☞ An election was held at Bellevue, Niagara Falls, on the 30th, for the purpose of deciding by a vote of yes or no, whether they will re-assume a corporate body, changing their name to that of Niagara City. The result has not been received.

☞ The nuts upon which Lieut. Strain's party were obliged to feed during their adventurous exploration of the Isthmus of Darien, contained a strong acid, which has destroyed the enamel of their teeth, and will result in their complete loss.

☞ It is proposed in New York to raise a subscription to aid Noble Butler, who has been put to great expense by the trial of the murderer of his brother, and would be obliged to sell his house, if not aided by the people.

☞ Mr. Cotterell, of Birmingham, England, offered Mr. Hobbs fifty guineas to pick a "patent climax detector lock" in twenty-four hours. The attempt has been made, and the ingenious Hobbs acknowledges a defeat.

☞ Late English Journals state war seems to have thrown its deadly blight even over the hallowed regions of art. The studios do not attract the usual number of visitors.

☞ A massive silver salver has been presented to Captain E. M. Filch, by the officers of the Washington, on the occasion of his retiring from the command of that steamer.

News Brevities.

—— Father Mathew is still administering the temperance pledge in Ireland.

—— Vermont holds her Whig Convention at Rutland, Wednesday, June 7th.

—— New Hampshire holds her Whig Convention at Concord, Tuesday, June 20th.

—— The London Zoological Society has sold two giraffes for £700, and a lioness for £115.

—— News has arrived of the death of Mrs. T. F. Meagher, who was on a visit to her friends in Ireland.

—— The whole of the Grand Trunk Telegraph from Buffalo to Quebec, has been completed.

—— The prices of breadstuffs are now higher than they were even during the Famine season of 1817 in Europe.

—— Several Western Democratic papers have put up the name of Thomas H. Benton, for the Presidency in 1856.

—— The church bells in Hartford were tolled for an hour at sunset, on account of the passage of the Nebraska bill.

—— John Mitchell has partaken of a public dinner at Richmond, and had tendered to him the honors of the city.

—— The Green county Whig names the Hon. Zadock Pratt, of that county, a suitable Hard candidate for next Governor.

—— The New York Herald has abandoned its three cent project, as the other two cent papers will not raise their prices.

—— A diamond, said to be of the first water, and weighing 19 carats, was lately dug up in Manchester, near Richmond, Va.

—— The Montreal Witness says about twenty vessels, from 800 to 1800 tons burden, have been built at Quebec during the past year.

—— A special meeting of the Regents of the University will be held on Wednesday, the 14th of June, at 12 o'clock, at the Capitol.

—— The editor of the Jackson (Mo.) True Witness says he has not seen a drunken man in Jackson *since the Legislature adjourned.*

—— A gentleman who has traveled from London to Kingston, Canada West, says the wheat crop looks finely everywhere on that route.

—— Fifty persons have recently been added by baptism to the church in Newport, R. I., said to be the oldest Baptist church in America.

—— The cholera broke out in Nashville, Tenn., on Sunday the 28th ult., and fifteen deaths are reported to have occurred from it.

—— In a recent trial before the U. S. District Court, Judge McLane said:—"Rum has sunk more seamen than all the tempests that ever blew!"

—— Andrew Williams, convicted at New York of the murder of his wife, by poison, has been sentenced to be executed on the 14th of July.

—— Measures have been taken in London for the establishment of a "Disabled Clergy Insurance Society;" the object of which is expressed in its title.

—— The Democratic State Convention for New Hampshire, is to be held on the 15th inst. A Governor and Railroad Commissioner are to be nominated.

—— Rev. Dr. Cummings, recently elected President of Genesee College, has arrived in Lima, and entered upon the discharge of his official duties.

—— A letter from Key West, received at Savannah May 29, says that the yellow fever has been raging there for two weeks. Several have fallen victims.

—— The teacher of the Stratford, Canada, Grammar School, has been fined 5s. and costs, by a magistrate, for whipping two of his pupils. Where is Matt. Ward?

—— The price of the tickets to the dinner recently given to Lord Elgin, Governor General of Canada, in London, was eight guineas; in federal currency, about $42.

—— Nashville, Tenn., has been chosen as the location of the Book Concern of the Methodist Church, South, by a vote of 60 to 57 for Louisville, Ky., on the sixth ballot.

—— A student in the Princeton, N. J., Seminary, named William Crapster, became a Unitarian during his studies, and was not allowed to graduate with the last class.

—— Immediate steps are to be taken in New York to promote emigration to Nebraska. Fill up the Territory with Northern Freemen, and slavery will be speedily "crushed out."

—— On Thursday, the 18th ult., the agent of the Virginia Colonization Society, embarked on board the ship Sophia Walker, in Hampton Roads, 116 colored emigrants for Liberia.

—— At Naples some pieces of parchment have recently been found in the binding of a book, containing three fragments, hitherto unpublished, of Cicero's famous treatise "On Fate."

—— A Western paper quotes Mr. Bancroft as having somewhere written of Jackson that "*he never died;* but when Death came, the old hero shoved him aside, and *stepped into glory!*"

—— Three hundred fat cattle from Kentucky, passed over the Columbus and Cleveland road on Friday week, en route for New York. The owner expects to realize, for the lot, $35,000.

—— The weather at Cincinnati was unfavorable for the observation of the eclipse. It is greatly to be regretted that Prof. Mitchell had no opportunity of using his very fine apparatus.

—— The first step in the construction of the tubular bridge at Montreal, was made on the 20th ult., by starting the first of the coffer dams, from the place where it was built down the ways.

—— Father Mathew has had another shock of the palsy. The physicians have advised him to try the air of Madeira. He does not avail himself of the advice for one reason only—he is poor.

—— A very large eagle was shot in Petersburgh, Va., lately, after it had destroyed eighteen lambs on one farm. The bird measured six feet and eight inches between the tips of its wings.

—— Laws against Sunday liquor-selling, and other Sunday traffick, are strictly enforced in Melbourne, Australia. Prosecutions are instituted by a Society for the suppression of vice and Sabbath desecration.

—— The Atrato, the largest paddle-wheel steamer in the world, made her first trip from St. Thomas to Southampton, a distance of 3,600 miles, in twelve days and twenty hours, averaging nearly 300 miles a day.

—— The West Point examination of Cadets came off lately. The graduating class, when it entered four years ago, numbered one hundred and thirty members. Resignations, dismissals and examinations, have reduced it to forty-six.

Literary Notices.

FERN LEAVES FROM FANNY'S PORT-FOLIO. Second Series. With Original Designs by Fred. H. Coffin. Auburn and Buffalo: MILLER, ORTON & MULLIGAN.—1854.

FANNY FERN is a popular American "institution," and has acquired an enviable reputation abroad. The remarkable success of her former efforts, paves the way for an extensive sale of the second series of "Fern Leaves." The volume has the prestige of popularity in matter, as well as externals. In the language of a contemporary—"We do not see that FANNY has lost any of the point, abandon, quick appreciation of character, exquisite tenderness or moving pathos that gave her so wide a public sympathy in the beginning." For sale by DEWEY.

HILLS, LAKES, AND FOREST STREAMS; or, A Tramp in Our Chateaugay Woods. By S. H. HAMMOND. New York: J. C. DERBY.—1854.

THIS is a beautiful volume, comprising descriptions of the scenery, and sundry sporting incidents and adventures, in the yet vast hunting and fishing region of Northern New York. Though first given by instalments, in a journal edited by the author, (the Albany Register,) the sketches are well worthy the permanent and handsome form in which they are now published. The book is a treasure in its line—not merely readable, but interesting and instructive.—DEWEY.

THE KNOUT AND THE RUSSIANS: or, The Muscovite Empire, the Czar and his People. By GERMAIN DELAUNY. Translated from the French by JOHN BRIDEMAN. New York: HARPER & BROTHERS.—1854.

SUCH is the title of another contribution to the already respectable number of books recently issued in this country, relative to an Empire, Government and People toward which the eyes of "the rest of mankind" have of late been turned with exceeding interest. It purports to speak advisedly of such interesting topics as the army, nobility, clergy, navy, magistracy, finances, slavery, the knout, the climate, the Emperor, etc. The volume, is profusely illustrated. For sale by DARROW & BROTHER.

THE STRANGE IN THE SYNAGOGUE: or, The Rites and Ceremonies of the Jewish Worship described and explained. By SIMON TUSKA, Son of the Rabbi of the Congregation Berith Kodesh, of the city of Rochester. Rochester: E. DARROW & BROTHER.

AN interesting little volume from the pen of one qualified to speak advisedly on the subject indicated in its title. We commend it to all who wish information relative to Jewish ceremonies and usages. It is dedicated to Rev. Dr. CONANT. The author is a young gentleman of excellent scholastic attainments.

Letter from Illinois.—Advertising.

WAUKEGAN CITY, Ill., May 31, 1854.

FRIEND MOORE:—I find myself very comfortably located (for the present) in this beautiful city, which has its being on the west shore of Lake Michigan—and its 6,000 souls—is located thirty-four miles north of Chicago—is accommodated by a daily line of steamers from north and south. These steamers are "A, No. 1," as to quality and crew, and touch at all the "fast" cities on this shore of the Lake. Returned today from Hainesville, a beautiful town twelve miles west. Found the farmers cultivating among the corn;—examined a portion of "Grand Prairie," and fed my eyes with a thousand beauties in Nature and Agriculture.

Of the character, intelligence, industry and general thrift of the business men of this city, I could—and would had I time and space—say many truths, and much to their credit. There are three weekly papers published here—and, like their editors, are all very respectable.

At the Post-office found *five* inquiries, (from yours and adjoining States,) respecting the purchase of the "Engine and Boiler," which I "did myself the honor" of advertising in your paper two weeks ago. *All* the parties write, "We notice by your advertisement in the *Rural New-Yorker*, that you have a steam engine and boiler," &c. I am happy to believe, (and be *convinced* at the same time,) that your paper circulates among the active and progressive people of yours and other States—and feel assured that those who do bless themselves by securing your "public blessing," are not of the sleepy sort of humans. Had I any thing else to offer for sale, I should select your paper, *first*, "to tell on't,"—as I should be "morally certain" to hit the active and knowing ones in community. *One* inquirer only for my "masheen," saw the advertisement in the Buffalo Daily Courier. I advertised for two weeks, in *ten* daily papers and your weekly.

Having told my recent "experience," I "halt"—wishing you and your *wide-spread* journal long and expanding success.

Yours, &c., PETER SAXE.

REMARKS.—We are glad to learn that friend SAXE—a worthy brother of the celebrated humorous poet and popular lecturer—has commenced his extensive Western tour under favorable auspices. Hope he will find, or take, time to give us for publication notes pertaining to prominent notabilities.

Our friend's experience in advertising is similar to that of many others who have tried the RURAL. Within a few months we have heard of several instances still more convincing. One person who advertised his farm in the RURAL, received inquiries from thirteen different counties in New York, and from several other States—while the same advertisement was given in other papers, and scarcely elicited a single inquiry. We are not unfrequently requested to discontinue advertisements before the expiration of the period paid for, on account of early sale, or no great demand for the articles advertised! We might cite many instances proving the superior advantages of the RURAL—but fortunately we have little occasion to offer any arguments in the premises. The large circulation of the paper—coupled with the fact that it contains but few advertisements (and none for a long period)—renders it so desirable a "medium," that instead of soliciting we frequently decline advertisements.

The steamship Daniel Webster from the Isthmus, was telegraphed at New Orleans, June 6th, $2,500,000 are on the way to New York.

Foreign Intelligence.

Arrival of the Asia.

THE steamer Asia arrived at New York on the 1st instant, bringing one week's later intelligence from Europe.

Russia has assumed a threatening attitude against Prussia. The Anglo-French armies contemplate an invasion of Russian territory. It is reported that the Russians have met a severe check at Silistria, and that they have also been defeated at Nicapo, with a loss of 1500 men.—Suliman Bey had also defeated the Russians at Radova.

News from Galatz states that Sebastopol had been bombarded by the allies for four days.—The combined Swedish and Norwegian fleets arrived at Elfsnaben on the 15th. The King went on board, and witnessed a great manifestation of hostile feeling on the part of the crews towards the Russians. The English fleets in the Baltic met with some terrible storms, but weathered them all.

The Cologne Gazette states that the Emperor of Russia has had a relapse of illness. The inhabitants of St. Petersburgh are obliged to find quarters for the troops, and there are in the environs of the city 20,000 Cossacks. It is stated that the Russian Government has insured to the Greek Government 1,000,000 drachmas per month. It also states that the Greek Government has granted letters of marque to the pirates who, at the present moment, infest the Levant. The ratification of the treaty of Triple Alliance had been exchanged at Constantinople.

A report was current in Liverpool that the City of Glasgow had foundered at sea, and that her crew and passengers had been conveyed to the coast of Africa. The report is said to have been received by a gentleman in Londonderry from one of the passengers.

A despatch from Vienna states that orders had been received at Adrianople to have provisions ready for 70,000 men, who are expected there toward the end of the month.

The Russians have commenced the bombardment of Silistria with 80 pieces of cannon.

The evacuation of Lesser Wallachia is suspended.

The Spanish ministry have refused the compensation demanded by the United States for the detention of the Black Warrior, and will make no concession beyond remitting the penalty of $6,000.

The latest accounts from Constantinople state that 1,000 houses were destroyed by the conflagration.

The Patrie says the latest news from the Black Sea confirms the fact of a reconnoissance having been made by the combined fleets as far as Sebastopol, and that the fortress was razed to the ground, and the Russian ships sunk, burned or captured; a few frigates would suffice to keep the Black Sea open, and the squadron could at once proceed to join the Baltic fleets, and with their united and tremendous force, repeat what had been done in the Black Sea.

The whole English Baltic fleet was under Gottska Sando, off Furth Oem, Gothland, waiting for the French squadron on the 13th of May.

The Collins steamship Arctic left Liverpool on her regular day, and on the same night, while going at full speed, she struck on Tuskar Rock, and immediately careened on the larboard side and went into deep water. On getting off the rock she proceeded some distance on her course, but Captain Lyce, finding that she was making water fast, put back to Liverpool. The Asia brought her mails, and it was expected she would be repaired so as to resume her trip in a week.

MARKETS.—In Flour and Wheat there is less doing, the trade being supplied, but the full rates are maintained. Fine descriptions of American wheat are not to be had, and would command an advance.

STATE ASYLUM FOR IDIOTS.—The Trustees of this Institution have just decided to remove it from Albany, and to erect permanent buildings at Syracuse. For this purpose they have purchased seventeen acres of land in a favorable spot. The purchase costs $10,000, of which citizens of Syracuse pay three-fourths. The small lot already bought in Albany, cost $7000, and may perhaps be sold at cost. Buildings will cost much less, and the Institution will be more economically managed than it would be in Albany.

THE Suspension Bridge at Niagara Falls is progressing with as much speed as such a work can, regard being had to its strength, durability and safety. The massive cables for passage and carriage bridge are nearly completed, and the timber work is all in readiness to be suspended. It is expected to be so far completed as to pass teams, passengers and freight in July. The railway bridge will not probably be ready for the cars before October.

IMMIGRATION.—It appears from the books of the Commissioners of Emigration, that the total number of aliens who arrived at the port of New York from the 1st of January last to the 24th ult., was 87,922, being an increase of 18,883 over the same period last year. The immigration last month was larger than ever before during an equal length of time, with few exceptions. A striking feature in this movement is the great increase in the German element of emigration, which now, as it has done since the year 1852, exceeds any other.

Marriages.

AT Ossian Centre, June 1st, by Rev. W. L. Andrews, Mr. WM. L. PIERCE, of Illinois, Liv. Co., and Miss ISADORE M. BROCKITT, of Ossian Centre.

AT Logansport, Ind., May 11th, Mr. SAMUEL VAN SCHUYVER and Miss EMILY C. MARLEY.

To Advertisers.

BREEDERS of Improved Stock, and all who have Domestic Animals for sale, will find the WOOL GROWER & STOCK REGISTER the best medium of communication with those most interested in Sheep, Cattle, Horses, Swine, Poultry, &c. It is also an excellent medium for general advertisers—all who wish to give their advertisements circulation throughout the country. Its wide and rapidly increasing circulation—coupled with the fact that it is the only stock journal in this country—renders it a most desirable and advantageous channel through which to reach those engaged in wool and stock husbandry, and kindred branches.

☞ After this month, Advertisements will be stereotyped and published and paged in regular paper—the cover being omitted. We propose to commence the new volume by publishing at least TEN THOUSAND EXTRA copies of the July No. Advertisements for that number should reach us as early as the 20th or 23rd of June.

TERMS:—One Dollar per square (10 lines, or 100 words,) for each insertion. Address

D. D. T. MOORE, Rochester, N. Y.

Commercial.

BUSINESS AND FINANCE.

NO arrival from California since last week. The four steamers then reported, and the amount of treasure brought by them, naturally produces a hiatus immediately succeeding.

The Europa took out, on the 31st ult., $659,271; the City of Manchester from June 3d, had on board about $10,000 for export, and the Franklin from New York, on the same day, $1,261,400. This large export, with that previously reported, has more than absorbed the entire amount of California arrivals by the four steamers.

The aggregate imports at New York since January are $75,105,110, against $78,122,629, same time last year. The aggregate exports are $28,426,840 against $21,694,105.

The Treasury of the United States, according to the Treasurer's official statement, contains $20,260,000, all in specie. Of this amount, on the 29th of May, $3,452,812 was in the Sub-Treasury at New York; $1,499,554 in the Philadelphia Mint; $4,405,845 in the Sub-Treasury at Boston; $2,585,521 in the Sub-Treasury at St. Louis; $2,081,810 in ditto at New Orleans; $1,701,821 in final Philadelphia; $500,000 at do. San Francisco; and the remainder in Sub-Treasuries and Branch Mints of the United States at other points.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, June 8, 1854.

WHEAT and Flour has again advanced, prices now ruling at $2,31½ for the grain and $10,75 per barrel for flour. Southern new wheat will soon be in the market, and purchasers hope the effect will be an abatement of the present enormously high prices. Oats and corn unchanged.—Barley is higher.

Potatoes more plenty and prices ruling downward; fire to seven shillings being considered fair quotations.

Old cheese mostly out of the market; new cheese brings 9 to 10 cents.

Rochester Wholesale Prices.

NEW YORK MARKET—June 5.

FLOUR—Market scarcely so firm for common grades, but the descriptions are without important change. Demand for home trade quite moderate, while there is no export inquiry. Sales at $9@9,25 inferior State; $9,31½@9,50 common to straight state, $9,50@9,75 mixed to fancy Michigan and common to good Ohio, closing dull. Sales at $8,87½, in bond, $9,50@9,75, duty paid. Only one small parcel sold at latter price.

Corn meal in fair demand. Sales at $3,81½ Jersey, $4,12½ Brandywine.

GRAIN—The good qualities of wheat are in fair demand at full prices, while the inferior grades are in better supply and the market favors the buyer. Sales common white Canadian at $2,01; good do at $2,40; prime white Genesee on p. t., supposed at about $2,62. Rye in good demand at full prices. Sales at $1,25, part to arrive. There is not much barley in the market. Demand light. Sales at $1,40c.

Corn market easier. No demand for export, and only a moderate inquiry for home consumption. Sales at 74@77 unsound; 78@80 sound western mixed 85, while South, closing with a downward tendency. Oats in better supply and prices easier. Sales at 60@70 closing unsettled.

PROVISIONS—Pork market scarcely so firm; sales at $13,50@$3 mess; small lots at $13,66½@02½ and $12@12,25 prime.

Lard is in fair request; sales at 9½@9¾. Butter easier sales at 12@16 Ohio; 16@20. Cheese dull at 6@9.

ALBANY MARKET—June 5.

There was but little produce offered on 'Change this morning, and the transactions have been limited. The demand is not active, and the market exhibits some heaviness.

FLOUR AND MEAL—We notice a steady market for Western and State flour. The demand is mainly for the better descriptions, which are in moderate supply. The sales at $8,25@10 for common to good State and Western, $10@10,50 for fancy Genesee, $10,25@10,75 for extra Ohio and Michigan, and $11@11,75 for extra Genesee. Corn meal is lower and is in fair request for the East. Sales at $4,50@4,66 per 100 lbs.

GRAIN—In wheat nothing has transpired. Corn is lower and in moderate request. Sales Western mixed at 80 delivered, and 79 afloat. Barley continues to come forward in small parcels. Sales good four-rowed at $1,17. Rye is quiet and nominal. Oats are held above the views of buyers. Good western are held at 62½.

FEED—While a small supply the market is better. Sales 1,000 bu second quality at $1,75 per 100 lbs., and 2,500 on 21 bbls at 94c. per bu.

SALT—Sales 5,000 14lb Onondaga sacks at 11c, and 100 bbls do at $1,62½.

BUFFALO MARKET—June 5.

Market for Flour active and unchanged. Sales Upper Lake at $8,25; good brands Ohio at $8,75; and choice Southern Ohio at $9,00.

Wheat quiet. Sales Racine at $1,70; white Ohio and Michigan scarce and wanted. Buyers offer $2,18½.

Corn held at 64@66c, and scarce; most of that arriving fills former contracts. Canal freights nilller. Corn 1½c, and Oats 56c to New York.

NEW YORK CATTLE MARKET—May 29.

AT Washington Drove Yard—Offered during the week 2,400 Beef Cattle. Cattle have come in plentier since our last, but the effect upon prices has not been perceptible, quotations still maintaining the high mark of the week before. We quote as follows:—Beef Cattle $11@13; Cows and Calves $50@70; Veal Calves 4@6½c per lb; Sheep $3@10; Swine (corn fed) $3,90@4,25 per cwt.

At Browning's—Prices at this market for Beeves have taken an unusually wide range. Sales at $9@12 per 100 lbs. for Beeves; Cows and Calves sold at from $30 to 50.—Veal sold at from 5 to 6½c per lb., live weight. Sheep range at from $3 to $8; Lambs at $2,50 to $6,50.

At Chamberlain's—Prices of Beef ranged at from $10 to $12,50 per 100 lbs. Cows and Calves—sales at from $30 to 75. Sheep and Lambs in good demand; wooled sold at 4@5½c per lb.; sheared 2½@6c. Lambs 1½@5c.

At O'Brien's—Sales of Beeves at $9@11,50. Cows and Calves at from $40 to $50. Veal Calves 4½@5½c per lb.

ALBANY CATTLE MARKET—June 5.

At W. Woolford's Bull's Head, Washington street.—Beef Cattle—430 at market. Prices—Extra $9,25; 1st quality $8,75; 2d do, $8@8,25; 3d, $7@7,50.

Cows and Calves—20 in market. Prices range from $30 to $40@60.

Sheep and Lambs—740 in market. Prices range from $4 to $5,50 for sheared.

Swine—Not any in market.

CAMBRIDGE CATTLE MARKET.—May 31.

AT market 634 Beeves, no Stores. Market Beef—Extra, $9,50 per cwt.; 1st quality, $9,00; 2d do, $8,50; 3d, $8,25; ordinary, none. Hides, ♈ cwt. $6,25@6,75. Tallow $8,25@8,50. Pelts, $1@1,50. Calf Skins, 10c ♈ lb.—quick.—Veal Calves from $3 to $4.

STAGS.—Working Oxen—No sales.

COWS AND CALVES—$30 to $56@75. Two years old—None. Three years old—$52 to $102.

SHEEP AND LAMBS—1,218 at market. Prices—Extra—$6 $7@10. 1ly lot—$3 to $4@5,16.

SWINE—None.

BRIGHTON CATTLE MARKET—June 1.

AT market 875 Beef Cattle, 50 pairs Working Oxen, 70 Cows and Calves, 1,200 Sheep and Lambs, 3,300 Swine.

PRICES—Beef Cattle—Extra $9,25@9,60; first quality $8 50@9; 2d, $7,25@8,25; 3d, $6,00@7,25.

Working Oxen—Sales from $13 to $175. Cows and Calves $20 to $65. Sheep and Lambs—$3,75@8,25.

Swine—Still hogs 5@5½c; Shoats to peddle, 4½@5½c; selected lots 5½@6½c; Spring pigs 8@9½. At retail from 6 to 7½.

LETTERS PATENT FOR DESIGNS, &c.

PERSONS wishing to obtain U. S. Letters Patent for Designs, are respectfully informed that all the necessary drawings and papers are executed by the undersigned, at the *People's Patent Office*, 80 Nassau st., New York, with dispatch, on very moderate terms.

Under the laws of the United States, Patents are granted for ornamental works and decorations of every kind, such as the ornamental designs upon stoves, walls, ceilings, wood and metal carvings, busts, statues, compositions of all kinds in clay and bas-so relievo, new forms of jewelry, watch cases, new designs for stamping on woolen, silk, cotton, or other fabric, or for any new impression, label, or ornament, to be placed on any article of manufacture, or any new and original shape or form of any article of manufacture. Such Patents secure to the Patentee the exclusive right to make and vend the same, for a period of seven years, the government fee being $15, gold.

The law for Designs requires the same process in soliciting, as for a mechanical invention, viz.: a model or specimen of the article, duplicate drawings, specifications, claims, &c. All the papers and drawings are executed by the undersigned. For further information, which can be had free of charge, apply to or address

ALFRED E. BEACH,
Solicitor of American and Foreign Patents, People's Patent Office, 80 Nassau st., New York. 231-4t

BOOKS BY MAIL FREE OF POSTAGE.

EHRLY'S PATENT RAILROAD HORSE POWER.

THIS Horse Power has, for several successive years, been subjected to many severe tests, both scientific and practical, in public and private, under every variety of circumstances and against the strongest competition throughout the United States, including California and Oregon. It has also met with great favor in Great Britain, as well as many of the continental countries of Europe, Asia and Africa; its superiority has been established in every instance beyond a contingency.

Among the peculiar properties of this Power, not possessed by any other in use, and which give to it its chief merit and popularity, are the following:—The Gears are outside the Power, (not under the horses) easily accessible and readily cared for. There being but two gears and one internal or coverage gear and all with their teeth made very accurately upon the most approved form, insures strength as well as smooth and equal action, and avoids unnatural wear and friction.

These gears, as well as the pully, may be instantly transposed, by means of their couplings and fastenings, from side to side, or to produce different degrees of force and motion, thereby allowing a slower pace for the horses, without, in any degree, lessening the effect. This last feature, together with a longer platform for the horses, is of great importance, and are among its most prominent features. Very little increased friction or retardation is produced by any amount of wear, as is the case with most other Powers.

All the gears, pulleys, &c., are so constructed that the greatest stress, in all cases, is applied to those of the greatest diameters, their strength being proportioned to the squares of their respective velocities; while with most others the opposite state of facts exists, and necessarily the weakest parts are there most exposed to wear and difficult of access and care. Again, the swellons of the endless platform being longer make a stronger and more durable plank floor for the horses. The platform returns over large swells at each end, and is easily kept adjusted as to tightness, by means of tightening bolts at the forward end.

Prices for 1854.

"Emery's Patent Changeable Horse Power," Thresher, Separator, for two horses	$160
Do. for one horse	128
Do. Two-horse Power, with Thresher and Cleaner combined	145
Common Rack and Pinion Power Thresher, &c., two-horses	150
Do. one horse	120
Emery's Patent Two-horse Power including band wheel	110
Do. one-horse do	85
Common Rack and Pinion, two-horse	105
Do. one-horse	75
Threshing Machine, with Separator and fixtures, 26 inch cylinder	90
Do. 24 inch cylinder	80
Set of Hands for Machine, with extras, &c.	35
Fanning Mills, suited for Power	5
Portable Circular Saw Mills, with 24 inch circular saw for wood cutting, &c.	$25, 28, 30, 32
Extra table and saw for filling boards and fencing stuff, and general shop use	37
Upright or Fellee Saw, for shipwrights' use	7
Cross-cut Saw, arrangements greatly improved	40
Irish Power for cutting logs	25
Churn attachment to Power, for one or more churns	12
Feed Mills, with iron plates	40
Straight Bar Stone Mills, for farm or mill use	$120 to 300
Power Corn Sheller	40 to 55
Clover Huller	30 to 100
Improved Dog Powers	12 to 15

TERMS—Cash or approved notes or acceptances, with interest, payable within four months, in Albany, N. York, Boston, Philadelphia, or Baltimore, as may best suit the purchaser.

As proof of the conceded excellence of this Power in its construction and actual performance, the public are referred to the numerous awards and decisions of juries, judges and committees, at all the principal Fairs and Exhibitions in this country, comprising those of nearly half the States in the Union, among which are the following, where it received the First Premium:

New York State Ag. Society	1853, 1852, 1851, 1850
Ohio State Board of Agriculture	1853, 1852, 1851, 1850
Michigan State Agricultural Society	1853, 1852, 1851
Indiana, Illinois, Pennsylvania, Maryland and Missouri State Agricultural Society	1853
American Institute	1852, 1851
Canada Provincial Society	1852, 1851
Exhibition of Industry of all Nations in New York	1853

Many more flattering testimonials might be produced, but as all are sold with a liberal warrantee, it is unnecessary.

The subscriber has purchased the entire stock and fixtures of the Warehouse 369 and 371 Broadway, and Manufactory of the late firm of EMERY & Co., of this city, and intends to carry on the business of manufacturing and selling Agricultural Implements.

The subscriber will also furnish to order and keep constantly on hand, a good assortment of the most approved machinery for the farm and plantation, including Reaping and Mowing Machines, Grist Mills, Power Corn Shellers, Corn Hullers, &c., together with a complete stock of Implements designed for the Garden, Farm and Plantation, in all the various departments, with a full and complete assortment of Field and Garden Seeds—as Clover, Timothy, Blue Grass, Orchard Grass, &c. For further particulars, address the subscriber, who hopes by due attention to business and a desire to please those who feel disposed to favor him with their orders, to merit a share of the patronage of the agricultural community.

RICHARD H. PEASE,
Albany, 1854.

The above Horse Powers, Threshers, &c., may be obtained of E. D. HALLOCK, Rochester, N. Y. 231-2tenw.

OLEN HAVEN.

THIS Water-Cure takes the first rank of establishments of this kind in the United States. During the past winter there have been from sixty-five to seventy persons in it taking Hydropathic treatment, and at the date of this advertisement there are not less than eighty who come from sixteen different States, and Canada.

The Institution is not nearly full, and the proprietors take pleasure in stating that for beauty of location, salubrity of climate, purity of air, softness, purity and abundance of water, Olen Haven is without a rival.

The Physicians; Doctors J. C. & Mrs. L. E. Jackson, and Dr. Harriet N. Austin, are known wherever the Water Cure Journal is read.

One route is from the east or west on the Central Railroad to the Junction; thence by omnibus to Skaneateles, and up the lake on the steamboat, or by James Tyler's livery. For further particulars apply for Circular. Address, Post-paid, J. C. JACKSON, M. D.
230-4t Scott, Cortland Co., N. Y.

The New Hydropathic Family Physician.—A Medical Adviser and Ready Prescriber, with references to the Nature, Causes, Prevention and Treatment of Diseases, Accidents and Casualties of every kind; with a Glossary, Table of Contents, and Index; the whole Illustrated with nearly Three Hundred Engravings and colored Frontispieces. By JOEL SHEW, M. D. One large volume of 820 pages, substantially bound in Library style. Published by FOWLERS AND WELLS, 308 Broadway, New York.—This great work contains,

I. Anatomical, Physiological, and Hygienic Dissertations, illustrated with numerous engravings.

II. The Nature of Disease, Physiologically and Pathologically considered; Rules for management in the Sick-room.

III. A Description of the various diseases to which the Human body is subject, with methods of Prevention and Cure, on Hydropathic principles.

IV. Management of Wounds, Hemorrhages, Fractures, Dislocations, Scalds, Burns, Poisoning, and other Physical casualties. Illustrated.

V. The Diseases of Females, with Advice and Directions for Home Treatment concerning Menstruation, Pregnancy, Childbirth, and the management of Infants.

VI. The Water-Cure processes fully illustrated and explained; Temperature of Baths, and the Philosophy of the Action of Water upon the Human System.

VII. The effects of Air, Exercise and Diet, with especial reference to the treatment of chronic diseases.

VIII. The Drug-Practice contrasted with Hydropathic and Physiological Treatment.

IX. Hydropathic Establishments; their Location, Formation, and Right Management.

The New Hydropathic Family Physician is the most elaborate and complete popular work on the subject. Every family should have a copy.

Price, delivered free, or will be sent prepaid by mail, only $2,50. The amount may be enclosed in a letter, and directed to FOWLERS & WELLS, 308 Broadway, N. Y.

THE PEOPLE'S PATENT OFFICE.

THIS well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with inventors from 9 A. M. to 5 P. M. All communications and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply in or address, post-paid, ALFRED E. BEACH,
Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 80 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Address as above.

TENTS FOR AGRICULTURAL EXHIBITIONS, &c.

TACKLES AND STACK COVERS FOR FARMERS!

THE subscriber, who for many years, has furnished *Tents* for the N. York, Pennsylvania, Wisconsin, and other State Fairs, has on hand a great number of TENTS, suitable for County or State Agricultural Fairs, which he will SELL at a moderate price, or RENT, as may be desired.

Also, a large number of CAMP MEETING TENTS, of Duck, sufficiently light to resist water in the severest storms. All Tents intended for more than one family, will be furnished with canvas curtains, or partitions, and the outside curtains are so arranged, that they may be closed so as to entirely exclude the night air. Also, HANDY TACKLE, for Farmers, a most useful article. For killing hogs, weighing hay, drawing logs and many other purposes, they are invaluable. Those having used them consider them almost indispensable. No. 1, fitted up with 40 feet of good rope, $3,75; No. 2, fitted up with 40 feet of good rope, $2,75.

Also, STACK COVERS, an excellent article for preserving Grain, &c., from rain. No farmer can afford to do without these covers, as often more than four times their cost is saved in one season.

☞ All orders, letters of inquiry, &c., (post-paid,) will receive prompt attention.

Address E. C. WILLIAMS,
229-4t No. 12 Buffalo st., Rochester, N. Y.

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

EMERY'S Horse Powers, Threshing Machines and Separators, Circular and Crosscut Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use—Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—GRAIN, FIELD AND GARDEN SEEDS, of the best Imported and Shaker growth.

E. D. HALLOCK.

Warehouse and Sale Rooms No. 24 Exchange Street, Rochester, N. Y. 226-tf

IMPORTED HORSE "CONSTERNATION."

THIS well known thorough-bred horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of YOUATT.

TERMS—$10 the season, $15 to insure, *payable in advance in all cases*. Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No mare will be served that is either ring-boned, spavined, or blind. J. B. BURNET.
Syracuse, N. Y., May 1, 1854. 228-3tw-31m

LAND PLASTER

AT Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

JUDAH ROWLEY.
217-tm.

BONE DUST.—We can supply a few barrels of genuine coarse bone dust, at $2,50 per barrel.

THE BEAUTIFUL.

BY IDA FAIRFIELD.

'Twas the glorious morn of creation's birth,
Our fair earth's natal day,
Which late from the wildest chaos sprung,
In its gloomy grandeur lay.

The spirit of Beauty softly bent
Before her Creator's throne,
And breathed the wish of her earnest heart,
In a supplicating tone.

"Go," said her gracious Lord, "I give,
Full power to thy fairy hand,
On earth, or air, or sea, to leave
The touch of thy magic wand."

The spirit sped on the wings of light,
And crossing the sun's bright ray,
She gave a gorgeous gleam of gold
To the mighty monarch of day.

Then out in the arching sky she hung
A veil of the softest blue;
And over the trees and herbs she flung
Their own peculiar hue.

She stooped to paint (twas a task of love,)
Each tiny flowret's cup;
And a gem of dew, a radiant pearl,
In each petal folded up.

Above the cataract's awful brow
She bent the iris bow;
And the snowy foam, and the dark, green hue,
She gave to the depths below;—

And lingered over the ocean long,
To tinge its thousand waves;
And painted the lip of the moaning shell,
Half hid in the coral caves.

A veil of moss on the brown rock threw,
And taught the singing stream
To wind, like a thread of silvery light,
Thro bare, wild cliffs between.

She caused in the desert's barren wastes,
A cool green spot to spring;
And hid in the storm-cloud's blackest wreath
The folds of a fiery wing.

She stamped the stars in countless forms,
With hints of crimson and gold,
And gave to the moon-light that mystic charm
Which is felt, but seldom told.

Thus sped the sprite on her work of love,
Till in sea, or grot, or dell,
Or earth, or air, no place is found
Where the Beautiful doth not dwell.

New Haven, May, 1854.

Rural Sketch Book.

THE FOUNTAIN VERY FAR DOWN.

BY VIRGINIA F. TOWNSEND.

"I don't believe it," said my cousin Ned, who was passing his college vacation at our house, and there was a world of unwritten skepticism in the air with which he dashed down the paper, over whose damp columns his eye had been traveling for the previous half hour.

"You see, cousin Nelly," continued Ned, getting up and pacing the long, old-fashioned parlor, with quick, nervous strides, "it's all sheer nonsense to talk about these doors in every human heart. It sounds very pretty and pathetic in a story, I'll admit; but so, too, do a great many other things, which reason and actual experience entirely repudiate.—There are hearts—alas! that their name should be legion—where 'fur away up' there is no door to be opened, and 'fur away down' are no depths to be fathomed. Now, don't, cousin Nelly, level another such rebuking glance at me from those brown eyes, for I have just thought of a case illustrative of my theory.—Don't you remember Miss Stebbins, who lived at the foot of the hill, and how I picked a rose for you one morning which had climbed over the fence into the road, and so, of course, became public property? Faugh! I shall never forget the tones of the virago's voice, or the scowl on her forehead, as she sallied out of the front door and shook her hand at me. A woman who could refuse a half withered flower to a little child, I wonder that roses could blossom on her soil! At the smiting of the rod,' no waters could flow out of such a granite heart. In the moral desert of such a character, no fertilizing stream can make its way."

I did not answer cousin Ned's earnest, eloquent tones, for just then there was the low rap of visitors at the parlor door; but I have always thought there was a good angel in the room while he was speaking, and that it flew straight to Miss Stebbins, and looking down, down, very far down in her heart, he saw a fountain there, rank weeds grew all around it, the seal of years was on its lip, and the angel smiled, as it floated upward, and murmured, "I shall return and remove the seal, and the waters will flow."

Stern and grim sat Miss Stebbins at her work one summer afternoon. The golden sunshine slept and danced in its play-house in the corner, and broke into a broad laugh along the ceiling, and a single beam, bolder than the rest, crept to the hem of Miss Stebbins' gown, and looked up with a timid, loving smile in her face, such as no human being ever wore when looking there.

Poor Miss Stebbins! those stern, harsh features only daguerreotyped too faithfully the desolate, arid heart beneath them; and that heart with its dry fountain was a true type of her life, with the one flower of human affection which had blossomed many years before along its bleak, barren highway.

She never seemed to love anybody, unless it was her brother William, who was a favorite with everybody; but he went to sea and has never been heard of since. Sally had always been a stray sheep among the family; but dark hours, and at last death, came upon all the rest, and so the homestead fell into her hands. Such was the brief verbal history of Miss Stebbins' life, which I received from Aunt Mary, who closed it there, in rigid adherence to her favorite maxim never to speak evil of her neighbors.

But that summer afternoon there came the patter of children's feet along the gravel walk which led to Miss Stebbins' front door, and at the same moment the angel, with golden-edged wings, came down from its blue sky home into Miss Stebbins' parlor.

She raised her head and saw there two weary-looking children, with golden hair, and blue eyes, standing hand in hand under the little portico, and then that old termagant scowl darkened her forehead, and she asked, with a sharp, disagreeable note in her voice, like the raw breath in the northeast wind—

"Waall! I should like to know what you want, standing there?"

"Please, ma'am," said the boy, in a timid, entreating voice, which ought to have found its way straight into any heart, "little sister and I feel very tired, for we have walked a long way. Will you let us sit down on the step, and rest a little while?"

"No; I can't have children loafing around on my premises," said Miss Stebbins, with the same vinegar sharpness of tone which had characterized her preceding reply. Moreover, the sight of any of the miniature specimens of her race seemed always fated to arouse her belligerent propensities. "So just take yourselves off; and the quicker the better 'twill be for you."

"Don't stay any longer, Willy, I am afraid," whispered the little girl, with a tremor rippling through her voice, as she pulled significantly at her brother's coat sleeve.

"Willy, Willy! That was your brother's name; don't you remember?" the angel bent down and whispered very softly in the harsh woman's ear; and all the time his hand was gliding down, down in her heart, searching for that hidden fountain. "You must have been just about that little girl's age when you and he used to go trudging down into the meadows together to find sweet-flag root. And you used to keep tight hold of his hand just as she does. Oh, how tired you used to get! Don't you remember that old brown house, where nobody lived but starved rats and a swarm of asps, who made their nests there in the summer time? And you used to sit down on the old step, which the worms had eaten in so many places, and rest there. How he loved you! and how careful he was always to give you the best seat! and then, he never spoke one cross word to you if everybody else did. Now, if you should let those children sit down and rest, just as you and Willy did on the old brown step, you could keep a sharp eye on them, to see they didn't get into any mischief."

The angel must have said all this in a very little time, for the children had only reached the gravel walk again, when Miss Stebbins called out to them; and, this time, that spiteful little note in her voice was not quite so prominent—

"Here, you may sit down in that corner a little while: but, mind you don't stir, for if you do, you'll have to budge."

"Little sister," said the boy in a low tone, after they were seated, "lay your head here and try to sleep."

The little girl lay her head, with its shower of golden curls, on her brother's breast; but the next moment, she raised it, saying—

"I can't sleep, brother, I'm so thirsty."

"Don't you remember that day when you and Willy went into the woods after blackberries, and how you lost your way groping in the twilight of the forest?" again whispered the angel, with his hand feeling all the time for the fountain. "You found an old lightning-blasted tree, and you sat down on it, and he put his arms round you just so, and said, 'try and go to sleep, little sister.' But you couldn't, you were so thirsty; for you had walked full three miles. Who knows but what those children have, too?"

There was a little pause after the angel had said this, and then Miss Stebbins rose up and went into her pantry, where the shelves were all immaculate whiteness, and she could see her face in the brightly scoured tin. She brought out a white pitcher, and going into the garden, filled it at the spring. Returning, she poured some of the cool contents into a cup which stood on the table, and carried it to the children; and she really held it to the little girl's lips all the time she was drinking.

Further and further down into the heart of the woman crept the hand of the angel; nearer and nearer to the fountain it drew.

Miss Stebbins went back to her sewing, but somehow her fingers did not fly as nimbly as usual. The memories of bygone years were rising out of their mouldy sepulchres; but all freshly they came before her, with none of the grave's rust and dampness upon them.

"That little boy's eyes, when he thanked you for the water, looked just as Willy's used to," once more whispered the angel, bending down close to Miss Stebbins' ear. "And his hair looks like Willy's, too, as he sits there with that sunbeam brightening its gold, and his arm thrown so lovingly around his sister's waist. There! did you see how wistfully he looked up at the grapes, whose purple sides turn towards him as they hang over the portico?—How Willy used to love grapes! And how sweet your bowls of bread and milk used to taste, after one of your rambles in the woods! If those children have walked as far as you did—and don't you see the little boy's coat and the little girl's faded dress are all covered with dust?—they must be very hungry, as well as tired and thirsty. Don't you remember that apple pie you baked this morning? I never saw pie done to a finer brown in my life.—How sweet it would taste to those little tired things, if they could only eat a piece here in the parlor, where the flies and the sun wouldn't keep tormenting them all the time!"

A moment after, Miss Stebbins had stolen with noiseless steps to her pantry, and cutting out two generous slices from her apple pie, she placed them in saucers, returned to the front door and said to the children—

"You may come in here, and sit down on the stools by the fire-place and eat some pie; but you must mind and not drop any crumbs on the floor."

It was very strange, but that old harsh tone had almost left her voice. The large tempting slices were placed in the hands eagerly lifted up to receive them; and at that moment, not from the lip of the fountain, not from the dust which lay heavy on its seal, there came a single drop, and it fell down upon Miss Stebbins' heart. It was the first which had fallen there for years. Ah! the angel had found the fountain then.

The softened woman went back to her seat, and the angel did not bend down and whisper in her ear again, but all the time his hand was busy, very busy at its work.

"Where is your home, children?" inquired Miss Stebbins, after she had watched for a while with a new, pleasant enjoyment the children, as they dispatched with hungry avidity their pie.

"Mary and I haven't any home now. We had one once, before papa died, a great way over the sea," answered the boy.

"And where are you going now? and what brought you and your little sister over the sea?"

"Why, you see, ma'am, just before papa died, he called old 'Tony to him—now, 'Tony was black, and always lived with us—'Tony,' said he, 'I am going to die, and you know I have lost everything, and the children will be all alone in the world. But, Tony, I had a sister once, that I loved, and she loved me; and, though I haven't seen her for a great many years, still I know she loves me, if she's living, just as well as she did when she and I used to go hand in hand through the apple orchard to school; and, 'Tony, when I'm dead and buried, I want you to sell the furniture, and take the money it brings you and carry the children back to New England. You'll find her name and the place she used to live in a paper (which anybody'll read for you) in the drawer there. And, Tony, when you find her, just take Willy and Mary to her, and tell her I was their father, and that I sent them to her on my death-bed, and ask her to be a mother to them for my sake. It'll be enough, 'Tony, to tell her that.' And 'Tony cried real loud, and he said, 'Massa, if I forget one word of what you have said, may God forget me.'

"Well, papa died, and after he was buried, Tony brought little sister and me over the waters. But before we got here, 'Tony was taken sick with the fever, and he died a little while after the ship reached the land and they had carried him on shore. But, just before he died, he called me to him and put a piece of paper in my hand. 'Don't lose it, Willy,' he said, 'for poor Tony's going, and you'll have to find the way to your aunt's alone. The money's all spent, too, and they say it's a good hundred miles to the place where she lived. But keep up a good heart, and ask the folks the way, and for something to eat when you are hungry; and don't walk too many miles a day, 'cause your little sister aint strong. Perhaps somebody'll help you on with a ride, or let you sleep in their house of nights. Now don't forget, Willy, and shake hands the last time with poor 'Tony.'

"After that, we staid at the inn till the next day, when they buried 'Tony; and when they asked us what we were going to do, we told them we were going to our aunt's, for papa had sent us to her, and then they let us go. When we asked folks the way, they told us, though they always stared, and sometimes shook their heads. We got two rides, and always a good place to sleep. They said our aunt lived round here; but we got so tired walking we had to stop."

"And what was your father's name?" asked Miss Stebbins, and somehow there was a choking in her throat, and the hand of the angel was placed on the fountain as she spoke.

"William Stebbins; and our aunt's name was Sally Stebbins. Please ma'am, do you know her?"

Off, at that moment, came the seal, and out escaped a fresh blessed tide of human affection, and fell down upon the barren heart soil that grew fertile in a moment.

"William! my brother William!" cried Miss Stebbins, as she sprang towards the children with outstretched arms and tears raining fast down her cheeks. "Oh, for your sake I will be a mother to them!"

A year had passed away; college vacation had come again, and once more cousin Ned was at our house. In the summer gloaming we went to walk, and our way lay past Miss Stebbins' cottage. As we drew near the wicket, the sound of merry child-laughter rippled gleeful to our ears, and a moment after, from behind that very rose-tree so disagreeably associated with its owner in cousin Ned's mind, bounded two golden-haired children.

"Come Willy, Mary, you have made wreaths of my roses until they are well nigh gone.—You must gather violets after this."

"*Mirabile dictu!*" ejaculated cousin Ned. "Is *that* the woman who gave me such a blessing a long time ago for plucking a half-withered rose from that very tree?"

"The very same, cousin Ned," I answered; and then I told him the change which had come over that harsh woman—of her love, her gentleness, and patience for the orphan children of her brother; and that, after all, there was a fountain very far down in her heart, as there surely was in everybody's, if we could only find it.

"Cousin Nelly," said Ned, "I'll agree to become a convert to your theory without further demurring, if you'll promise to tell me where to find a hidden fountain that lies far down in a dear little somebody's heart, and whose precious waters are gushing only for me."

There was a glance, half arch, half loving, from those dark, handsome eyes, which made me think cousin Ned knew he would not have to go very far to find it.

He who is conscious of superior powers, resolutely preserves the integrity of his nature, perseveres in the plans which he has adopted for beneficial purposes, and despises empiricism.

Men of the noblest disposition think themselves the happiest when others share their happiness with them.

Youth's Corner.

ILLUSTRATED REBUS, NO. 25.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

ACROSTICAL ENIGMA.

I am composed of 23 letters and 7 words.

My 1, 9, 4, 10, 16, 8 is what many farmers make.
My 2, 13, 14, 6, 8 is not above.
My 3, 22, 2, 10, 5 is the time to prepare for life.
My 4, 6, 18, 17 is the name of a celebrated Swiss patriot.
My 5, 12, 8, 4 is an animal.
My 6, 3, 8, 19, 16 is the nest of an eagle.
My 7, 22, 12, 14 is an amphibious animal.
My 8, 19, 17, 18 is a small stream.
My 9, 15 is a pronoun.
My 10, 22, 3, 11, 22, 2, 15, 6 is a place where toys are kept.
My 11, 16, 12, 18, 20, 5 should be preserved by all.
My 12, 21, 23 is a small insect.
My 13, 22, 9, 21 is a part of speech.
My 14, 19, 23, 4, 3 is a song.
My 15, 6, 13, 19, 22, 8 signifies older.
My 16, 3, 6 is a part of the body.
My 17, 12, 19, 8 is the residence of wild beasts.
My 18, 9, 20, 16 is a musical instrument.
My 19, 8, 22, 13 is a metal.
My 20, 19, 17, 17 is what all farmers should do in their land.
My 21, 12, 21 is a name given to a sheep.
My 22, 18, 14 is not young.
My 23, 8, 2, 10, 5 should always be told.

My whole is an admonition that should be heeded by all.

Wit and Humor.

An athletic specimen of a man, from the Emerald Isle, called into the counting-room of one of our river-street merchants. He took off his hat to make his best bow. "The top o' the morning to ye, Misther I'——; I've been told ye're in want o' help." "I're but little to do," replied I'——, with mercantile gravity. "I'm the boy for ye'es. It's but little I care about doin,—sure, it's the money I'm after." The native reply procured him a situation.

We never much admired the church warden's wife who went to church for the first time in her life because her husband was church warden, and being somewhat late, the congregation were getting up from their knees at the time she entered; and she said with a sweet condescending smile, "pray, keep your seats, ladies and gentlemen: I think no more of myself than I did before."

At a late trial, the defendant, who was not familiar with the multitude of words which the law employs to make a trifling charge, after listening a while to the reading of the indictment, jumped up and said, "Them 'ere allegations is false, and that 'ere alligator knows it!"

A writer in an Irish newspaper, after mentioning the wreck of a vessel near Skerries, rejoiced that all the *crew* were saved, except *four hogsheads of molasses.*

To Medical Students.—How are the sinews of war connected with the bone of contention, and in what manner do they act upon the *muscle*-man.—*London Diogenes.*

Charming Place of Residence.—A Washington correspondent, in describing a beautiful young lady, says:—"She has a face a painter might *dwell* upon."

A woman has sued for a divorce in Indiana, on the ground that her husband's feet were so cold it distressed her. A case of clear incompatibility of temperament and of *sole.*

The man who "borrowed trouble," has returned it without any expression of thanks.

THE WOOL GROWER AND STOCK REGISTER.
VOL. VI.—ENLARGED AND IMPROVED!

The fact that the circulation of the W. G. & S. R. has more than *trebled* during the past two years, and is daily increasing, induces us to be culture an enlargement and improvement, which will at once render the work far more acceptable and valuable, if not indispensable, to all engaged in Wool Growing, the breeding of Improved Stock, or the rearing of Domestic Animals generally. Though our arrangements are not entirely completed, we can safely announce that—

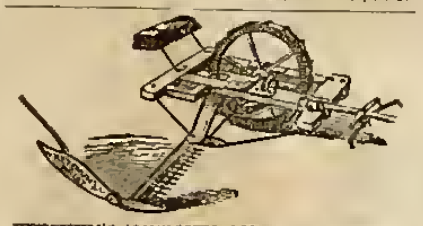
On the commencement of its Sixth Volume, July, 1854, the Wool Grower and Stock Register will be enlarged to Thirty-Two Pages monthly, printed upon new and handsome type, and essentially improved in other respects. The Yearly Volume will comprise 384 octavo pages, or *double* the number contained in the present, (exclusive of the advertising cover, which will probably be omitted.)—This will give ample room for the discussion of many subjects which require attention, but which we can scarcely notice with our present limited space. Among other matters, we propose to publish Pedigrees of pure bred cattle, horses, sheep, &c., and to give the names, residence, &c., of the principal breeders of Improved Stock throughout the country—for the mutual benefit of owners and those desirous of purchasing.

Arrangements are making to improve the *quality*, as well as increase the amount of reading matter. Regarding the reliability and value of its Contents as of far more importance than the size or appearance of the paper, we shall endeavor to secure the assistance, as contributors to its pages, of the best and most experienced writers on the various subjects discussed,—and cordially invite the co-operation of all disposed to aid in enhancing its value and usefulness.

Although we hope to double the *value* of the paper, its subscription price will not be increased—except perhaps to clubs of 20 or over. Single copies will be furnished at Fifty Cents—3 copies for $2, and 8 for $5. ☞ The first five volumes, bound in colored paper, will be sent post-paid, and the numbers of the 6th volume as issued, for $3.

The attention of all interested in the subjects and objects of a Stock Journal, is respectfully solicited. The readers of the Rural New-Yorker are especially invited to give the W. G. & S. R. an examination, and, if approved, their encouragement. Specimen numbers, &c., cheerfully sent, gratis, to all applicants. Address

May, 1854. D. D. T. MOORE, Rochester, N. Y.



KETCHUM'S IMPROVED MOWING MACHINE,
WITH ENTIRE CHANGE OF GEAR, THE ONLY SUCCESSFUL MOWER NOW KNOWN.

Ketchum's *Improved* Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: *durability, convenience and ease of action.* The shafts now have bearings at both ends, which overcomes all crimping and cutting away of boxing. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being *on upper side of the frame;* oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its whole width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

It requires not over ten minutes to get one ready for operation, there being but two bolts, (besides the pole bolts,) to be secured to have one ready for use. They will cut *all kinds of grass,* and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair; it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make this machine deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying *untried* Mowers; if they do (as was the case with many last year) they will incur loss, vexation and disappointment.

If any parts are wanted to repair any machine we have sold, or may hereafter sell, they will be furnished and only manufacturers' cost for the same be charged.

☞ In all cases where extra sore wanted, be sure to give us the *number of your Machine.*

(WARRANTY:) That said machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of *any kind of grass,* and do it as well as is done with a scythe by the best of mowers.

The price of the Mower, with two sets of knives and extras, is $110 cash, in Buffalo, delivered on board of boat or cars free of charge.

Office and Shop, corner of Chicago street and Hamburgh Canal, near the Eastern R. R. Depot, Buffalo, N. Y.

HOWARD & Co., Manufacturers and Proprietors.

The Mower is also manufactured by Rogers, Norris, Mason & Co., at Worcester, Mass., for the New England States.

By Seymour, Morgan & Co., Brockport, N. Y., for Illinois, Iowa and Michigan.

By Wilder & Brokaw, Springfield, O., for Ohio and Kentucky. 220-31.

J. Rafalje & Co. are also sole Agents for the sale of Ketchum's Mowing Machine in Rochester, and for the vicinity 220-1jy mll-31

EDWARD HARRISON'S PATENT GRIST MILL

Received the highest premium at the World's Fair; and more than 750 of them have been sold within two years. The stones are French Burr; the frame and hoppers, cast iron; and the spindles, cast steel. They will work bolt for flouring and on all kinds of grain, and will keep in repair longer than any other mill. Having just completed my new buildings, for manufacturing and running them, I am now prepared to supply all orders for all the sizes, from 20 inches to four feet diameter, including a superior bran and plantation mill, which will grind corn in the best manner, by horse-power, or even by hand. Public attention is invited to this small mill in particular. Descriptive circulars, with cuts, sent to post-paid applications.

225-1t* EDWARD HARRISON, New Haven, Ct.,
Sole manufacturer, and Proprietor of the Patent.

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to Individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 2½ cents per quarter, payable in advance, to any part of the State—and 6¼ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. BIXBY,—H. C. WHITE,—T. E. WETMORE.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

Progress and Improvement.

GALLS ON HORSES.

SOME horses are more predisposed to galls than others; but even the most liable to injury in this respect may, by care, be kept perfectly sound. Bad harness is the great cause of galls. In order to save a few shillings in restuffing an old collar, getting camel's-hair pads, or, perhaps, a new collar, many a valuable horse has been materially injured, and ever afterwards particularly liable to sore shoulders. The collar should be frequently examined, inasmuch as it is very likely to become hard and lumpy. A little pounding will generally remove the difficulty, and render the collar soft. If the horse is known to be predisposed to sore shoulders, camels'-hair pads should always be used. Heavy and unsteady work is also a frequent cause of galls. A man unused to labor can easily blister or gall his hands, while he who labors habitually suffers no inconvenience. So it is with horses; they have, perhaps, done little or nothing during the winter, and, when the busy season comes on, they are put to "breaking up," or other heavy work, and, as a natural consequence, their shoulders are galled. Could any other result be expected? Light work, till their shoulders were hardened, would be a more humane and profitable course.

Bathing with salt and water is a good thing to harden the shoulders. Some prefer to bathe the shoulders in the morning previous to going to work; but we think it is better to do it at night, and wash it off with cold spring water in the morning. Otherwise the particles of salt are apt to adhere to the collar or to the hair, and act somewhat as would fine sand in a person's boot. Of course the poor horse is allowed to rest his weary limbs on the Sabbath, for, as experience has fully demonstrated, neither man nor beast can labor seven days in the week with impunity. On Saturday night, therefore, the shoulders should be thoroughly bathed with a saturated solution of salt and water, washing it off on Monday morning before commencing work. These precautions are particularly necessary where the skin exhibits tenderness or becomes knotty or thickened. A few minutes' labor, night and morning, is all that is required, and it cannot be better applied.

In case of actual sores, or where the skin is broken, it is desirable that the horse be allowed to rest a few days; but if this is impossible, the collar must be so padded as not to touch the sore. It would seem essential that the sore be covered in some way so as to keep out the dust, and prevent the flies from troubling it.—We never found anything answer the purpose in this particular. If any of our readers have been more fortunate, we should like to hear from them. A solution of alum is good to bathe the sore with, but we prefer white vitriol (sulphate of zinc.) We know of nothing so cooling and healing. A tea-spoonful should be dissolved in a pint of water, and the sore be kept constantly moist with it. For this purpose it will be necessary to take a bottle of it into the field with you, and to keep a moistened rag on the sore all the time. Act on these hints, and your teams shall praise you.

CULTIVATING INDIAN CORN.

LAST fall we passed a field of corn belonging to Mr. DAVIDSON, of Greece, in this county, and we were much struck with its luxurious growth. On speaking to Mr. D. on the subject, he informed us that "no hoe had not been in the field since the corn was planted." As soon as the corn was visible he harrowed it with a common drag, repeating the operation in a few days in a contrary direction. The drag would cover up a few hills here and there, which a boy, following the drag, would easily uncover. It pulled up none of the corn. He then horse-hoed each way, and afterwards, with a plow, threw up some soil to the hills by going each way of the rows. A cleaner field of corn we never saw. A field of corn on the opposite side the road, cultivated in the ordinary way, at twice the expense of Mr. DAVIDSON'S, was not half so good, while the soil was the same, and the previous treatment much better.

It is proper to state that Mr. D. used a compost made by mixing the cleanings of the poultry house with unleached ashes and plaster, applying a little to each hill at the time of planting. He thinks this the best manure that can be used for corn. The mixture, he states, does not evolve any ammonia.

Labor is unusually scarce this season, and seed time and harvest demand the attention of the farmer at the same time, so that, if hoeing corn can be dispensed with, it will be no small advantage to the cultivator. We do not see why, by the constant use of the horse cultivator, corn cannot be kept perfectly clean; at all events it may be so used as to leave little labor for the hand hoe.

Of the advantages of hilling up corn there is much difference of opinion, both among practical and scientific farmers; generally the latter advocate flat culture, while the former practice the hilling system. We are disposed to think the former right. It hardly seems probable that a system should become so general among intelligent, observing, practical agriculturists as this has, if it was radically wrong. There are, however, some very good reasons offered for flat culture, and there are those who claim they have found it is not only theoretically, but practically, better than the hilling system. It appears marvellous that the question has not long ago been decided by careful experiment. The only theoretical advantage we can see in favor of hilling, is in the well known fact, that covering a portion of the lower parts of a plant has a tendency to favor elaboration of sap, and to induce early maturity. If hilling has this effect on corn in the Northern and Eastern States where at best our seasons are very short, and early frosts so frequently injure late corn, it is a sufficient reason for the almost universal custom.

In what we have said about Mr. DAVIDSON'S method of cultivating corn, we have quoted from memory; if we have made any mistakes, he will be kind enough to point them out, and if we have not, we should like further information on the subject.

PINE APPLE CHEESE.

ENS. RURAL:—Having noticed a request in the RURAL of March 25th, that some one posted on the subject, would give the mode of manufacturing Pine Apple Cheese, I waited a response from some of your able correspondents, but seeing no reply as yet, I will try to answer the inquiry.

I should make the curd the same as I would for hoop cheese. If I varied from that, it would be to scald and salt a trifle more. Any curd that will make first-rate hoop cheese, will make good pine apple, as the principal difference consists in the manner of curing. The mold is a block of timber 10 inches square, sawed one way, hollowed out in the form of a pine apple with a neck 4 inches in diameter, extending to the top of the block to admit the curd. The greatest diameter of the cheese is seven inches, its length ten besides the neck, which is pared off, leaving the cheese round.

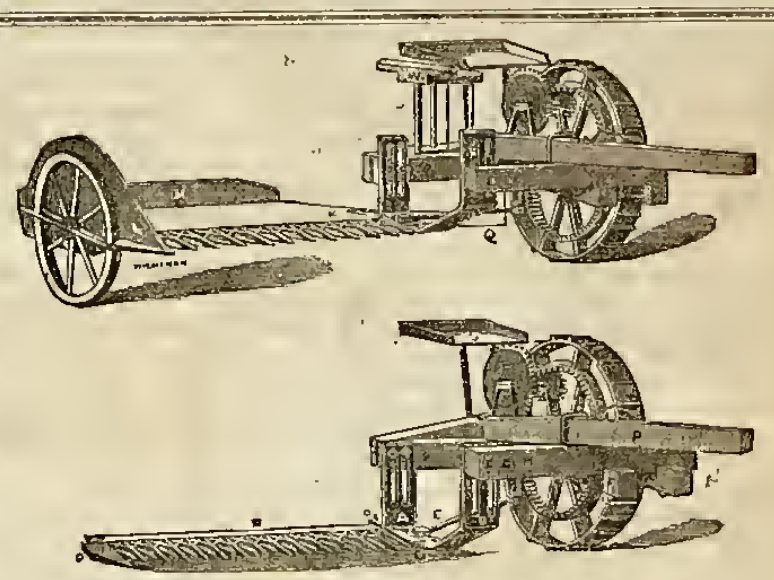
Inside one-half of the block are 4 short pins, and inside the other are 4 holes, to keep the two halves in place when put together. They are confined with a gripe, the same width of the block one way, and 2 inches wider the other, to admit of two thick wedges by which the gripe is tightened. The press is made of four-inch scantling 8 or 10 feet in length; one end is placed between two strips of board, with short pins put in about close to the end; which hook under the upper board, to keep it in its place when the lever is moved up or down in putting in or taking out the cheese. A board is placed two feet from the other end, on which the lever rests in a horizontal position when the cheese is out. The weights are hung on this end, and when removed the lever is raised by hand. A stick four inches square, two and a half feet in length, is suspended from the lever two feet from the first end. It is circular at the top, and hung by means of two short boards (nailed on each side of the lever) and a pin which passes through the whole, allowing it to vibrate towards either end of the lever. Six inches on the lower end of the perpendicular stick is made round, having the same diameter as the neck of the cheese. The press or presses cost only a trifle, or any farmer can make and put them up. I have described only one press, but any number desired can be fastened at one end by the same board and rested at the other on the same supporter, having room enough between for the molds to stand in a row. The cheese is pressed in a cotton bag, fitted to it at the bottom and large enough at the top to turn off from it. The bag is placed in the mold, a tin filler made large at the top, with a four inch neck, is placed within it, the curd is pressed down with the hand, the bag is pulled up to prevent wrinkles, when the mold is full the bag is laid over and a follower two inches thick. It is then ready to be pressed. The next day it is taken out the neck, pared, and ironed with a hot flat-iron. A net is then put on, and tied up at the neck or large end of the cheese. It is then suspended in a kettle of water, not quite scalding hot, until the net will settle in and mark the cheese, when it is hung on a rack for five or six weeks.

The cheese should be kept in a cool, dry room, as butter frequently drips from those in the nets in the hottest days. If they should mould, they are brushed with a stiff brush, but never greased. When the net is taken off they are placed in a trencher, (turned out to fit the bottom of the cheese,) where they remain on shelves until boxed for market. The boxes contain ten cheeses, two in width and five in length, with very thin strips of board between them, so that no two can touch each other. They are washed in warm suds, rinsed in cold water, and dried before they are boxed.

The expense of the molds was two dollars apiece. The nets can be made of rope-makers' twine, but I prefer cotton yarn, No. 8, made five-threaded, twisted; doubled and twisted again makes good twine. They are knit like common netting, the meshes are ½ inch square, with loops at each, which are 1½ inches long. It requires some expense and labor to make the nets, but when made they are durable.

I am not informed with respect to the present market for pine apple cheese, having for several years been out of the business, consequently would not influence any one. But I would say to any who might choose to manufacture it, spare no pains to make a good article, and you have every reason to expect a good price. I entertain a high opinion of pine apple cheese, believing that when rightly made it possesses a finer and more delicious flavor than any other cheese. N. M. R.

TRY EXPERIMENTS.—If every farmer would appropriate a small portion of his farm every year to experimental farming, great benefit could not fail to result from the practice. I know a farmer, who for many years has used plaster on his corn land liberally, and, as he supposed, to great advantage. Last season he left unplastered one row through the middle of his field, and to another he applied leached ashes. The row to which the ashes was applied, was the only one which looked and yielded better than the one to which no application was made. On many soils, ashes are of much more value than plaster, and farmers should *try* every kind of fertilizer, before they adopt the use of one, to the exclusion of all others. Try experiments! H. L. S.



FORBUSH'S REAPING AND MOWING MACHINE.

COMBINED REAPERS AND MOWERS are coming into vogue, and apparently gaining popularity, in various sections of the country.—Several machines, each designed to perform the chief item of labor in both haying and harvesting, have been invented and improved within the past few years, and are extensively manufactured in this State, Ohio, Illinois, and elsewhere. Among these, the most prominent, probably, are those of FORBUSH, ATKIN'S, and MANNY. The latter, as manufactured in this State, last year, proved unsuccessful; but it has been essentially improved by Mr. WM. A. WOOD, and as now made by him, the machine is warranted "capable of cutting an acre per hour of any kind of grass, as well as ordinarily done by hand by the best mower, and to work well as a reaper." Those wishing information as to price, &c., are referred to Mr. WOOD'S advertisement in a recent number of this paper. ATKINS' Self-Raking Reaper has already been described in the RURAL, and recommended to the attention of its readers. The raking apparatus is a most ingenious and curious piece of mechanism, and though simple and effectual in operation, must be seen to be understood.—This machine is best known as a reaper only, but the proprietor asserts that forty "were used the last harvest in grass or grain both, with almost uniformly good success." It is manufactured by J. S. WRIGHT, of Chicago, whose advertisement is given in this paper.

FORBUSH'S Improved Machine, represented above as used for both Reaping and Mowing, combines, it is claimed, all the advantages possessed by separate machines for each operation. It is easily changed from a mower to a reaper—the only difference being the addition of the platform, L, M, K. An examination of this machine has enabled us to judge somewhat of its merits, and we are favorably impressed in regard to its ability to properly perform what is claimed. We hope to have an opportunity of witnessing its performance in a few weeks. The American Mowing and Reaping Machine Co., of Buffalo, are extensively engaged in manufacturing the machine, and furnish it on the terms stated in our advertising department. The following extract from the Company's Circular, comprises definite information relative to the ability and construction of this machine:

"The Company have the most satisfactory testimonials, that it will accomplish all that is claimed for it, and are satisfied, after a thorough investigation of the relative merits of the different Mowing and Reaping Machines now before the public, that the *above is the best in the world!* Every Machine sold, will be *warranted* to be made in a *workmanlike* manner, and of the *best* materials, and capable of *cutting* from *ten* to *fifteen acres* of grass or grain per day, with one span of horses and driver, and in all respects to do the work as well and as easy for the horse, as any other Machine in the country. The following particulars may be mentioned as points of *superiority:*

1. The Machine is compact, simple, durable, conveniently arranged, and easily managed.

2. The bolts are all accessible, and in sight of the driver when on his seat.

3. There is *no side draft*, and the horses can work all day on the machine, as easily as they can plow.

4. The grass is left smoothly spread over the ground.

5. The Raker's seat is so arranged that the grain may be raked off at the side, away from the track of the wheel, or in rear, as may be preferred.

6. The platform to receive the grain is so constructed, that it requires but a few moments to attach or detach it from the machine, and when on, it is perfectly substantial.

7. The platform, finger-bar and knives may be raised or lowered, and secured at any point, so as to cut the grass or grain at any height desired.

8. The clamp which holds the finger-bar, is so constructed that no bolts are required to pass through the finger-bar, and so that the same *connecting rod*, finger-bar and knives are used, for grain and grass.

9. The guard fingers are so constructed that they mutually brace and support each other, and effectually prevent the knives from choking or clogging in any kind of grass.

10. The machine is not likely to get out of repair, but if a guard or knife should break, another can be put on in the field without going to a machine-shop.

11. It can readily be *thrown out of gear* with one hand, and the *gear-key* holds the wheel in *gear* perfectly secure.

12. A small wheel is attached at the heel of the finger-bar and near the clamp. This is designed to take the weight of the finger-bar and clamp when backing or turning corners. It will also raise the finger-bar and knives above the *mown grass* when necessary to "*carry the swaths*," or pass over the field without mowing. It will be found of great service in supporting the frame when changing from a Mower to a Reaper. This improvement has been added since last season.

13. The machine is well protected by Letters Patent in the United States and Territories, England, the Canadas, and all the British Possessions—and all persons purchasing of the Company or its Agents, will be guaranteed its unmolested use."

UNDERDRAINING, &c.—The following extracts from a private letter from our esteemed friend SAML. WILLIAMS, Esq., of Waterloo, refer to two of the most interesting subjects connected with rural economy; viz., underdraining, and substitutes for hay.

"The drawing, making, saving and applying organic manures, and deep thorough culture, is the doctrine to preach to farmers; all else is leather and prunella. It would make your heart ache to see so many fine fields too wet to plow, while I have sweet corn up, pie-plant large, and have hoed my black seed onions twice. Without underdrains, I should be like the impious farmer, repining at Providence for sending rain in such bounteous profusion. I sold the butcher a calf three weeks old, for $2,50. He bought one of a farmer, five weeks old, for $1,75, not as fat or heavy as mine.—Yet it cost the farmer more to keep his cow on $10 hay, than it cost me to keep mine on stalks, oat-straw, and two quarts Indian corn and one quart oil-meal a day; the calf could not take all the milk into three quarts a day."

A SUBSCRIBER says soaking turnip seed in fish oil for 24 hours, and drying it off with ashes, is an effectual remedy against injury from the "fly." We fear this is too good to be true, but it is worthy a trial.

Communications.

VALUE OF LEACHED ASHES.

Eds. Rural:—I saw in the latter part of the last volume of the Rural, a short piece on the value of leached ashes, and having experimented with them on a small scale for a few years past, I have thought perhaps it might benefit my brother farmers, by giving my experience in the matter, and in so doing I will try to be as concise as possible. A few years ago I had a piece of sandy land, (some eight acres,) that I wanted to sow to wheat, preparatory to seeding to clover; and not having sufficient stable manure to cover the whole field, I put on some two acres of it about twenty loads of leached ashes to the acre—say five hundred bushels—and on the rest some twenty loads of barn-yard manure to the acre; plowed and sowed to wheat in September; tilled all alike. In the month of April after, I stocked heavy to June clover, then sowed plaster on the whole, and then harrowed once over on the wheat. The clover took first rate. There was but little difference in the wheat, but, if any, in favor of the ashed part, being rather the most even—the berry first rate on the whole. But there was a perceivable difference in the young clover, that on the ashed part being much the best. The next spring I plastered it again evenly over the whole field. Now the ashes began to tell; on the ashed part it was much the rankest, and began to lodge before blossoming. The difference could be seen from a distance—that on the manured part standing straight, and not so even. The season being dry, the part lodged did not heat nor mould, and being cut early, made first rate hay—the ashed part producing at least double the bulk—say from two and a half to three tons per acre. The next season we plowed the whole field, and planted to corn—manuring about one-half the field, (eight acres,) with some twenty loads of coarse barn-yard manure to the acre—the part formerly ashed, plowed, as it was, without manure. This season, (the last,) the dryest ever known in Michigan—the ashed part still holding its own fully with the manured part—the whole field produced about fifty or sixty bushels of ears to the acre, of the brightest and best corn that I ever raised, and the average of corn in this part of the State was not more than two-thirds of a crop. On this piece I left a strip a few rods wide without manure. On this strip there was a falling off of nearly one-half.

On another piece of this clover sod, some years ago, I drew about the same quantity of ashes, as before, on most of the field, (three-and-a-half acres,) leaving a strip on two sides without the top-dressing. One of these I covered thickly with coarse manure; the other I left as it was, with only the sod; plowed the whole, and planted to corn; plastered and tilled the whole alike. When we came to harvest, we found but little difference between the ashed and manured part, except the ashed was the most even; and on the part with only the clover sod, there was a falling off of about one-half—the whole piece yielding full eighty bushels of ears to the acre of good sound corn.—The next spring I sowed the same field to oats and seeded to clover—the part formerly ashed producing nearly double the other—the part formerly manured but little better than the part with only clover sod; and although a very dry season, the field yielded forty-two bushels to the acre. The clover took tolerably well, although much the best on the part ashed.—Last season we plastered the same and mowed it, and although a remarkably dry season, much of the ashed part produced from two to three tons per acre of June clover. That on the part formerly manured was but very little better than clover sod—being a falling off of about one-half.

I think that ashes are much the best for sandy land, because much more lasting. I have never tried anything that will make clover grow so rank as ashes; and if we can get a rank growth of clover, it is the very manure we want, on sandy land. My soil is very light, originally lightly timbered with oak, beech, and soft maple, with an undergrowth of poplar, sassafras, boxwood and whortleberry. I am about putting them on plentifully this season, and shall probably experiment somewhat, and, if thought best, will communicate the results to your excellent paper. Leached ashes cannot well be moved unless tolerably dry, as they are heavy drawing. I spread them from the wagon. Perhaps a less quantity would answer a good purpose, but I have plenty of them, and have put them on liberally. I would say, try them if you can get them; and if you forget the results, your land will not soon.

If this sketch will induce my brother farmers to try them, I shall be amply repaid.

Yours, &c., William Cone.

Curious "Freak of Nature."—I have a chicken just hatched that has three legs. The extra one hangs loose from the hind part of its body, and has only two toes. It is a perfect chicken in every other respect, and is doing well.—Charles Todd, *New Berlin, N. Y.*

LABOR AND LABORERS.

Notwithstanding the fact that there are thousands of idle people squandering away their time in our towns and cities, there is yet a *great call* for laborers in the rural districts. Labor in this region of the country is nearly, if not quite, fifteen per cent. higher than it was one year since. Several causes have, no doubt, operated to bring up the price of labor. One reason of the high price of labor, is the high price of flour and other provisions. Men who have families to support, cannot live without they increase the price of labor. If they have to pay $9.00 for a barrel of flour, fifty or seventy-five cents for a bushel of potatoes, and so on, certainly it is perfectly right that they should have higher wages for their work.—When potatoes could be obtained at two shillings per bushel, and perhaps at a lower figure than that, then labor was plenty, and the usual price which a man charged for a day's work was four shillings. Now, farmers are glad—really glad—to get laborers at six shillings or $1.00 per day. "Month-hands" demand large wages, and succeed in getting high prices for work. Two years ago, $11.00 per month was considered liberal pay for a common hand, while good hands demanded from $12.00 to $14.00 per month.

There is not the least doubt but that the metropolis of New York could supply the rural districts with thousands of good hands, if the idlers of that large city would but bestir themselves to the importance of changing their miserable homes for far better ones in the country. They live in the city because amusements are common; because it contains people and buildings, and because they get accustomed to city habits, &c. But the country is the place for them; it is the spot for them to improve their now miserable condition. Even in our small by-towns, we see young men idling away their time, and at the same time refusing to work in the country, where health would bless them, where cheerfulness would surround them, and where corrupt habits would attend them not. We who carry on the business of agriculture, want farm laborers to improve the condition of our farms, to build up the agricultural world, and to render the condition of the country better. There is no pretext for those who live in the city to advance, in relation to the want of labor in this country.—There is enough of it to do in almost all regions of the land; and you idlers who live in cities in miserable shells, and subsist on miserable food, can find healthful employment among farmers, if you will act the part of wise people. If you complain that you do not know how to perform agricultural labor, we can soon teach you. So, in this respect, there is no pretence for your clinging to the corrupt avenues of large cities.

The labor system wants revising. It wants stirring up. There are too many cigars smoked by our young men; too much carousing among them, and too much idleness, which seems to have become almost second nature to them. All men—all young men—are not able to labor, but the great majority of them are, and they ought to work for the prosperity of the country; for be it remembered, everything nice, everything that is grand and gay, glittering and costly, convenient and comfortable, proceeds immediately from *labor*—mark.—And how many young lawyers and young doctors there are, who might do their country some service, by forever abandoning their professions, and taking hold of the plow, and thus promote objects of importance, instead of those that are of *no* particular importance. *Doctors*, kill *not* your fellow-man, but turn your attention to agriculture. *Lawyers*, get your neighbor *not* into trouble, but go "straightway," and try your hand at the plow, the scythe, and the mechanic arts. Your services are required both at the mechanic-shop and in the field—the broad and rich field of agriculture. *Foreigners*, and you who live in large cities without employment, we want you to labor, for which we will compensate you liberally, and will feed you well,—giving you plenty of fresh air to breathe, beds that will do you no harm, and occupations that will promote your happiness, give you character, and make you what you will not be, if you cling to corrupt avocations in corrupt cities. W. Taffan.

Baldwinsville, N. Y.

MINERAL MANURES FOR WHEAT.

It strikes me that Dr. Lee is out of the line of his duty to western farmers when he tells them that "33½ bushels of wheat may be grown by the use of lime and ashes alone, without ammonia or organic manures of any kind;" that "with cheap mineral fertilizers, clover and other renovating crops may be grown so as to give a high degree of fruitfulness, without either guano or the manure of the stable." Thirty years ago some of our Pennsylvania German farmers gave as an excuse for their inattention to stable manures, that "clover and plaster were better than stable manure;" that green clover plowed into their heavy, calcareous loams, acted both mechanically and chemically on the soil. But the crops of wheat thus manured have long since begun to deteriorate in plumpness of berry, as well as in yield of bushels; so that at this time every good farmer bears his testimony in favor of barn-yard manure, as the only certain renovater of the soil, exhausted of its wheat-growing pabulum. On the old wheat lands of Pennsylvania, liming has been found to be renovating, if sparsely applied to thin soils, and more plentifully on soils that have received more organic or carbonaceous manures; thus showing that the office of the lime was to dissolve the inert vegetable matter in the soil, as poor soils bear less liming than the richer soils. Dr. Lee says, "On many poor soils lime alone has power to bring out latent potash, soda, magnesia, chlorine, phosphoric and sulphuric acids enough to supply the wants of several good crops." Very well, but after those several crops are taken off, what is to supply the place of the now exhausted pabulum for future crops? Nothing short of the manure of the stables, the privy, or Peruvian guano, in which the compounds of nitrogen are present in full force.

I can but think that the Gissen or mineral theory is much better suited to the silicious worn-out soil of Virginia, Maryland, and a part of New England and New York, than to the calcareous, alluvial soils of Western New York. There nitrogen and other organic matter went first, and then the mineral matter.—To lay a basis for the former, the latter must be first supplied to the soil; but in our alluvial west, the mineral basis still remains, the soil needing only the mechanical aid of draining and deep plowing, with the addition of that mineral matter which all manures containing nitrogen must of necessity supply, and which owing to the wasting of the volatile organized nitrogen, is but too often richer in its mineral constituents than in the volatile organic compounds. S. W.

Waterloo, N. Y., 1854.

DEEP PLOWING.

The season having again returned when farmers are busily engaged in turning the sod, or stirring the soil, I will add my testimony in addition to others, in favor of deep plowing.—Four years ago I purchased the farm on which I now reside. Being a stranger in this section, I commenced plowing my land with deep furrows—which some of my neighbors noticing, they remonstrated, saying that I was turning up ground so poor that nothing would grow. I will remark here, that the farm has been tenanted for 20 or more years, till the soil was supposed to be exhausted. My faith being strong, I continued to plow as deep as I could, and, I believe, with good results; from 32 acres of land I gathered over 1,500 bushels of corn.

In the fall of the same year I plowed a lot of some 9 acres for wheat. This was contrary to common custom, as the old fallow system was then, and is yet to some extent, in vogue. From this field I had cut a light crop of grass. When I was plowing this field, some inquired what I was plowing for. I told them for wheat. The reply was, "You will not get your seed. The last crop did not yield 5 bushels to the acre." Well, that was discouraging; but I let the teams go on,—the first team drawing the Eagle C, and the next a subsoil. I will remark here, that the field should have been plowed earlier, as this was the last of August and the first of September.—The wheat was sown without any manure, the last of September, and the yield next season was over 22 bushels per acre. The ground was seeded, but did not take well.

The next season I pastured it till after harvest, and then plowed it with a double or Michigan plow, followed by a subsoil, and sowed the 24th of September with Hutchinson and Soule's wheat; and the yield, I think, was not less than 33 bushels per acre. The only manure for the last crop, besides the poor and closely eaten grass sod, was 30 loads of leached ashes, and some 9 or 10 of muck and marl, scattered broadcast over the field just previous to sowing. The ground is now worth more than 50 per cent. more than it was 4 years ago.

It may not answer to turn up the soil to a much greater depth than usual at first, but a gradual deepening can be practiced with advantage in almost all cases. I have heard some say that they plowed deep; and when interrogated how deep, would say 6 or 8 inches. When I plowed the above field the last time, the depth was 12 inches, followed by the subsoil going some 6 or 10 inches deeper.

I. A. Clark.

Pigeon Hill Farm, Marion, Wayne Co., N. Y.

Crops in Oswego County.—Wheat with us, looks bad; grass not first rate; spring crops well, and the prospect has never been better for a good fruit crop. Early cherries and strawberries are beginning to ripen. The peach has had a hard winter, and in some districts has been pretty well thinned out, but there is yet left a good average crop. Grapes never, perhaps, set so full. Plums, apricots, and nectarines, as well as the cherry, to some extent, are being pretty severely punctured by the curculio.—A. Stone, *Hinmanville.*

Agricultural Miscellany.

THE WEATHER—WHEAT CROP IN ENGLAND.

What will wheat be worth after next harvest, we are frequently asked, and invariably reply—*It depends principally on the weather in Europe.* If the English get a warm, dry summer, the wheat crop will be unusually large, and they will need less imports: on the other hand, should they be visited with a cool, rainy summer, the wheat crop will be fearfully deficient, and the demand for foreign breadstuffs be beyond all precedent, with corresponding high prices.

The *Mark Lane Express* of May 29 says: "During the week the temperature has continued low for the time of year; indeed, the nights have been very cold—a circumstance decidedly unfavorable to vegetation. The reports from the Agricultural districts are, nevertheless, on the whole, of a satisfactory character; the wheat plant is perhaps not looking quite so promising on all descriptions of land as it did a few weeks ago, but thus far we have heard of no serious complaints."

We know of no better test of the prospects of the wheat crop in England than Mr. Lawes' experimental wheat field. This field has been sown annually to wheat for eleven successive years, and the several plots supplied with the various organic and inorganic constituents of crops. The condition of the soil becomes more and more artificial every year, and the crop more susceptible of climatic influence, till it is now a tolerably correct gauge of the prospects of the wheat crop, so far as they are affected by climate. In a private letter we have just received from Mr. Lawes, dated Rothamsted, May 27th, he says:—"I wish you had an opportunity of seeing the experimental wheat field this year; *I think it looks better than I ever saw it*, and if we have a fine and hot harvest, it bids fair to yield the largest crop grown since the commencement of the experiments. After a very dry spring, we are now deluged with rain, which will do much good, *providing it will clear up at the end of June.*"

On the whole, therefore, we may conclude that a large breadth of land has been sown in England, that at present the crop looks exceedingly well, but that the yield at harvest will depend now altogether on the weather, about which it is vain to speculate. Let it be ever so favorable, however, there can be no doubt that farmers in this country will receive amply remunerating prices. We have heard of several contracts for the growing wheat at $2 per bushel. (See articles on news page of this number.)

Wisconsin State Ag. Society.—The annual meeting of this Society took place on the 17th of May, when the following officers were elected for the ensuing year:

President—E. W. Egerton, Waukesha.
Secretary—Albert C. Ingham, Madison.
Treasurer—Samuel Marshall, Madison.

The fair will be held at Milwaukee, on the 3d, 4th, and 5th of Oct.

Cotswold Sheep—Great Fecundity.—In a report made to the Maryland Agricultural Society, it is stated that Mr. Boswell, of Clark Co., Va., who has greatly improved his flock of sheep by breeding from pure Cotswold bucks, had 11 ewes, which brought this spring 28 living lambs; 5 of the 11 brought 16, one of the 5 brought 4, and the other 4 brought 3 each.

Plowing Match.—The Monroe County Agricultural Society will hold a Plowing Match at Scottsville on Tuesday, June 20, at 10 A. M. It is expected to be the most spirited ever held in the County. The premiums are liberal, and will call out much competition. A good time is anticipated, and we hope all who possibly can will be present.

The Price of Flour.—Now that flour has advanced in this market to a figure seldom, if ever, before attained, it may not be uninteresting to our readers to know what is paid for this article elsewhere. We subjoin the following statement of prices of best flour in different markets, as gathered from our latest exchanges. It will be remembered that the quotations are the wholesale prices, to which must be added the retailer's profit, from twenty-five to seventy-five cents per barrel, to get the price paid by the consumer.

Rochester—extra Genesee,	$10,75
Buffalo—extra Ohio,	9 25
Cleveland—extra Ohio,	9 25
Toledo—Miami and Michigan,	8 50
Cincinnati—extra,	8 00
Detroit—prime,	8 50
Milwaukee,	7 50
Chicago—extra superfine,	7 75
Toronto,	8 25
Oswego—city extra,	10 75
Albany—extra Genesee,	11 50
Boston—extra Genesee,	11 88
New York—extra Genesee,	11 76

—*Rock. Union.*

Cure for Scratches.—Mix 1 oz. of chloride of lime and 1 quart of water; wash the parts well; after which apply white lead ground in oil. This has never failed to cure.

The Pork Crop.—The receipts at tide water for the month of May, of pork, bacon and lard, amount to eighteen million pounds.

TIME FOR CUTTING HAY.

The practice among farmers of permitting grass to stand in most cases until the seeds are formed, and not unfrequently until they are ripe, has become so general that it seems almost folly to call in question its correctness; but it is so manifestly at variance with reason and analogy, and with the experience of those who have thoroughly tested the merits of early and late cut hay, that it may be worth an effort to arrest the popular custom.

Science has long since incontestably demonstrated that plants in arriving at maturity have large quantities of their *starch, sugar* and *gum*—their most nutritive elements—converted into woody fibre, which contains comparatively very little nutriment.

Experience has proved that cattle will thrive on hay cut before the seeds were formed, while the same cattle when fed on larger quantities of the same kind of hay, but cut after the seeds were ripe, required the addition of grain to "keep them up."

Again: When the experiments of making sugar from cornstalks were being tried some years ago, it was found that to retain the saccharine matter in the stalks, the ear shoots had to be stripped off as soon as they made their appearance, as they became worthless. The moment the ears or seed commenced forming, the starch, gum and sugar left the stalk and became concentrated in the grain, and of course the stalks, to the sugar maker, were valueless. This observation and reason has taught man. The *instinct* of animals—an unerring guide as to what is best suited to their wants—leads them to prefer the early to the late cut hay, as every observing farmer is aware. Even when in pasture they invariably leave the ripe stalks and eat only the younger shoots, although they may have to pick it blade by blade, and are compelled to be constantly feeling to get a sufficient quantity, while the ripe grass stands thick, affording abundance in quantity.

The proper time to cut grass, I repeat, is when the heads begin to bloom. It will not make as much hay, but an acre thus cut is much more nutritious, and will go much further in keeping stock than if left for seeds to ripen. Any one who will try this experiment will never again leave it to ripen, although by so doing he may save himself some trouble in the making.—J. G. in *Farm Jour.*

To plant without manure, and sell the crop off the land, is the poorest of all farming; but to plant, either with manure or without, cultivate thoroughly, consume the crop on the land, and to secure to it the benefit of all the manure, is the beginning of good farming.—*N. Y. Eve. Post.*

Agriculture needs no eulogy. As long as men love bread, it will need no advocate. It feeds the world. Without it the sails of commerce would rot in idleness; factories stand still for lack of work to do; cities perish, and the race of man cease to be.

Inquiries and Answers.

SUBSOILING TO DESTROY CANADA THISTLES.

As I am about commencing to plow a field intended for wheat in the fall, for the purpose of killing Canada thistles, and feeling that I had not the requisite information on some points, I concluded to seek it through the columns of the Rural. My soil is a clay loam, rather retentive of moisture, and not very well underdrained. I have thought that in case the thistles were not entirely subdued, they might take deeper root. What I wish to know is, whether it would be advisable to use a subsoil plow? and, if so, as I intend to plow the field four times, at which plowing should it be used? Would you recommend the application of lime? The farm is limestone land. I thought of applying equal quantities of lime and plaster, as plaster succeeds admirably, and I have faith in lime.

I wish to know, also, where I can get a Jack, as some of us intend to try to raise mules. I hope you will not think me too inquisitive, for these are points I wish to be informed upon; and I did not know where I could apply with better prospects of success.—I. H. Coe, *Springport, N. Y., May* 30, 1854.

Subsoil plowing would, doubtless, be beneficial to the soil, but we do not think it would be likely to kill any more thistles than simple plowing, say 12 inches deep. We once subsoiled six acres of a seven acre field, leaving an acre unsubsoiled. The subsoiled portion, the first year after, threw up an immense quantity of Canada thistles, wild mustard, and other weeds, while the unsubsoiled acre was comparatively clean. The subsoiled, however, ultimately became freest from weeds, and yielded the best crops. The field was thoroughly underdrained, and had been for many years under rather slovenly cultivation. The earlier in the summer it is subsoiled the better. If your object is simply to destroy the thistles, would it not be well to turn up rather a shallow furrow the first plowing, harrowing and cultivating it to kill all the thistles, and then plow a little deeper, harrowing and working as before, and so on till the whole soil was thoroughly clean to the depth of twelve inches? We should be glad to hear the opinion of our experienced readers on this point.

It does not follow, because plaster answers on your soil, that lime would be equally beneficial. There is not much land in Western New York that needs, or at least that will pay for, an application of lime.

Will some of our readers say where a good Jack can be obtained?

Orchard and Garden.

AFTER-CULTURE OF TRANSPLANTED TREES.

The importance of proper attention to the after-culture of newly transplanted trees, has not been generally appreciated in this country, either by farmers or horticulturists. The orchard or fruit garden is planted, well or ill, according to the skill and energy of the proprietor—and then the trees are left to take care of themselves, or the treatment given is inefficient and useless from lack of thoroughness. Planters have sought rather to collect the new and rare, than to improve, and bring to its highest perfection, the well-known and proved-to-be-good varieties. They have forgotten the higher pleasure of successful culture for the whim of gratifying their pride or love of novelty.—This should not be so, nor need it. Information on the subject can easily be had, and no source of acquiring it should be neglected by the lover of fruit and shade trees.

The *Horticulturist* for May contains a valuable paper from the editor on the subject of Arboriculture—the treatment of the soil of the nursery, fruit garden, and orchard. We condense the following practical hints therefrom:

The health and vigor of trees depend almost entirely upon the condition in which the roots are placed, because the roots perform the important office of feeders. The spongy extremities of the roots are the mouths through which the food must pass; and if these are bound up in a compact mass of earth, almost impenetrable to air and moisture, it is impossible for them to find the necessary supply of food. No matter how rich the soil may be, if not in the proper mechanical condition, its fertility will be of no avail; because the chemical combinations which prepare the food of trees and plants cannot go on in the absence of air and moisture. Here lies the prime defect of cultivation generally; it is not deep and thorough enough *to reach the roots*. No mere hand-hoeing of a narrow circle around the tree will answer; the points of the roots are much further off, and the earth should be kept finely pulverized *all around them*, and some distance *beyond* them. Anything less is labor lost.

Nurserymen usually plow between the rows of trees as deeply as a one-horse plow can go with safety to the roots, and then follow with a cultivator, once a fortnight, say from May to October. The plow is used three or four times during the season. This mode of culture will protect the trees against the effects of our long and severe drouths as no other can; and nursery trees so treated will continue growing, while others merely dressed with a hoe, are completely at a stand still. A deeply pulverized soil always contains moisture, while one baked on the surface turns up as dry as from an oven. Mr. B. tells of a case in which they lost two years in the growth of young apple trees, by substituting the hand-hoe for the plow and cultivator.

Of course the plow cannot be used around all transplanted trees. We have mentioned it to show the influence of deep culture around the roots, and that some other implement must be substituted which will serve the same purpose. Young orchards should by all means be cropped, if cropped at all, with something requiring constant cultivation—potatoes, carrots, beets, turnips, &c.; grain, grass and corn crops should be avoided, for they stop the growth of young trees, but if absolutely necessary, a strip should be left along each row of trees, that the plow and cultivator may be used. In plowing near trees a slow and gentle horse should be used, with long traces, which give steadiness to the plow. The whiffletrees should be as short as possible, and have on each end a piece of cloth or India rubber to prevent injury in case it strikes a tree. In this way, with care, one can plow within a few inches of the trees. In plowing over the roots, the furrow should be regulated so as not to cut or tear them, and the plowing should always extend at least two or three feet beyond the roots.

"Where the use of the plow and cultivator is impracticable," we quote now without abridgment, "a *forked hoe* with long and stout prongs, should be used repeatedly during the season. This implement is much better than a spade, as it does not cut the roots; and it is better than the common hoe because it enters the ground deeply, and gives it a thorough stirring up. Such an implement as this is extensively used in France. * *

To plant a tree on a lawn properly and successfully, a wide hole should be cut for it *twice or three times as wide as the roots*—and the whole of this circle should be kept clean and deeply pulverized for several years, until the tree has sent out numerous and powerful roots in all directions. No matter when or how trees are planted, this after-culture is absolutely necessary; and we will say to those who have planted recently, that unless they bestow such labor on their trees, better for them now to pull them up and burn them, and thus save all further expense.

Mulching—which means covering the ground with half decayed manure, decayed leaves, or some such material—is a commendable practice in the management of young trees, and of dwarf fruit trees, and all others whose roots are near the surface and confined to a small space. It not only keeps down a growth of weeds, but guards the roots against frequent changes and the ill effects of a drying atmosphere. This, however, will not render cultivation unnecessary; for with all the mulching the ground will settle down and become compact, unless of an extremely sandy or porous nature."—R.

INJURY TO DWARF PEARS.—INQUIRY.

Eds. Rural:—There were sold, during the winter and spring of 1851, in this, and the adjoining county of Dutchess, not far from 80,000 dwarf pear trees or pear trees budded on quince stocks, of the Angers variety. During the spring just passed, more than half of those trees have died. The quince stocks have entirely failed, the roots are black and dead; many blossomed and made an early, feeble growth, but sooner or later, hundreds have withered and died. There seems to be no difference between those that have borne fruit, and those that bare not; neither soil nor situation makes any difference, but all alike seem to share in the general failure of the roots. Can you, or any of your numerous readers give any information on this important subject, and much oblige many anxious inquirers?

S. Crandell.

Chatham Four Corners, Col. Co., N. Y., 1854.

Bugs on Vines.—A mixture of two quarts hen dung, two quarts fresh cow manure, and two gallons of water, sprinkled occasionally on young vines, will effectually prevent the depredations of bugs. Great care should be taken not to apply *too much* of the mixture, as it will destroy the plants. This is a *sure* remedy, and has been successfully used among my acquaintances, for several years. S.

Advantages of Weeding.—1. Seven acres of light gravelly land were fallowed and sown broadcast: one acre was measured, and not a weed was pulled out of it; the other six were carefully weeded. The unweeded acre produced 18 bushels, the six weeded acres averaged 22½ bushels per acre—a gain of 25 per cent. 2. A six-acre field was sown with barley in fine tilth, and well manured. This weeding, owing to a great abundance of charlock, cost 12s per acre. The produce of an unweeded acre was 13 bushels; of the weeded, 28 bushels—difference in favor of weeding, 15 bushels per acre, besides the land being so much cleaner for the succeeding crop. Of six acres sown with oats, one acre, plowed but once and unmanured, produced only 17 bushels per acre; the rest, plowed three times, manured, and weeded, produced 37 bushels per acre. Of this increase, at least 10 bushels may be attributed to the weeding, and 10 to the manure.—*Journal of the Bath and West of England Agricultural Society.*

A Seedling Apple.—R. B. Warren, Esq., of Alabama, Gen. Co., N. Y., very kindly sent us a box of handsome Russet apples, about the size of our Golden Russet, (described in some of the books "English Golden Russet,") but more of a grey color, like the Pomme Gris.—It is very regularly formed and fair, but altho' of good quality does not equal the Golden Russet in richness. It keeps well, and from what Mr. Warren says of its productiveness, it is undoubtedly worthy of cultivation. Mr. W. says:—"The tree bears a large crop every year; (this year seven barrels.) The fruit is good sized, fair and smooth. The samples sent, are, perhaps, rather above the average size. They keep well till June. The tree is about twenty years old, and there can be no doubt of its being a seedling."—*Horticulturist.*

Splendid Plant.—There is now in full bloom, in the Liverpool Botanic garden, a beautiful specimen of the *Wistaria sinensis*.—This splendid plant, which is considered the finest specimen in Britain, covers a space of wall amounting to nearly nine hundred square feet. At the present time there are about six thousand *racemes* or bunches of flowers on it, each bunch bearing on an average about fifty-five flowers, so that it bears on the whole about 330,000 individual flowers. In addition to the pleasure given to the eye, this plant yields a most grateful perfume.

Onions.—It is perhaps unknown, to many of our readers, that the onion is one of the most nutritious of roots, containing when dried, from twenty-five to thirty per cent. of gluten. It is a great staple of life in Spain and Portugal. Onions are not a relish merely, to the Spaniard, for they help materially to sustain his strength, and add beyond what their bulk would suggest, to the amount of nourishment which his simple meal supplies.

If you have any species of the aphis in your nursery, please make a trial of the following decoction:—Get from a druggist ½ pound of quassia, boil it fifteen minutes in six quarts of water; pour off the decoction into a dish-pan with handles. When cool get an assistant to hold the pan while you carefully bend down and immerse the branches—giving them a little motion to wet all the insects.—*Gar. Tel.*

The eater of the common green lettuce, as a salad, takes a portion of lactucarium, a narcotic substance similar in properties to opium, which it contains; and any one will discover that his head is affected after indulging freely in a lettuce salad. Eaten at night, it causes sleep; eaten during the day, it soothes, calms, and allays the tendency to nervous irritability.

PROTECT YOUR FRUIT TREES.

No fault is more common with farmers than to neglect young fruit trees during the early part of their growth, and indeed we have seen pears, plums, and other trees, after being carefully put out, to be apparently forgotten by their owner neglecting the early pruning, cleansing of the surfaces, careful removal of insects, &c.; and, indeed, left unprotected from cattle in fall and winter, so that during these seasons, when cattle are fond of browsing, the young trees are partly denuded of bark, young limbs, &c., so as to be rendered comparatively worthless for after use. When fruit trees are once in place, they will pay well for exact and proper treatment; and by proper pruning, cleansing of bark by the soda wash we have so often recommended, and full tillage, they will prove more profitable than the current crops of the farm, requiring less labor in proportion to the value of their products. The mode of treatment for every kind of trees has been given in our back volumes.—*Working Farmer.*

The Curculio.—A correspondent of the New York Tribune says that a friend, after having tried many ineffectual remedies for the curculio, mixed sulphur and lard with a little Scotch snuff, and rubbed it freely on the body and branches of the tree. The curculio had already commenced their work at the time, but not relishing the smell of the snuff, in a few days they all left; and he had such a crop of plums that he was obliged to prop the branches up to keep them from breaking off. This remedy is worth trying.

Important.—A gentleman gives notice that he has been entirely successful in securing fine crops of plums, for three years in succession, by the application of dry ashes, thrown over his trees in the morning, after the blossom leaves, and until the fruit is somewhat advanced. The application here, last year, was also successful.—*Keene Sentinel.*

Girdled Trees.—Take out a block of wood extending into the bark above and below the girdle, and take from the body or limb of another tree a block corresponding in size and shape, with the bark on, and adjust it in the place, and bind it there, on the principle of engrafting. This plan, it is said, has proved completely successful.

Wash for Trees.—Heat one pound, of sal soda, to redness, in an iron pot, and dissolve it in a gallon of water. This wash will take off all the moss and dead bark, and kill all the insects on all fruit trees or grape vines, and make them as smooth as though polished, and make old trees bear anew. Never whitewash a tree.

Domestic Economy.

Mint Sauce.—Many of our country friends do not know what a luxury they deprive themselves of, when they eat lamb either boiled or baked, without *mint sauce*. Set a few roots of spearmint in one corner of the garden, and they will soon furnish an abundant supply. Strip off the leaves and chop them fine, add an equal amount of sugar, and cover the whole with vinegar. A small tea-cupful of the mixture will be sufficient for a large family. Try this and see if it is not far preferable to greasy gravies.—*Ohio Cult.*

Keeping Eggs.—A friend who has made several voyages to the coast of Africa and other tropical regions, says that he has kept eggs in the best condition, by placing two or three dozen in a cullender, and pouring over them as many quarts of boiling water, then pack away in straw, or bran, or saw-dust. Newly laid eggs must be used for this purpose, and they will be found as good for boiling after a year, as if perfectly fresh, when treated as above.—*American Agriculturist.*

Apple or Gooseberry Souffle.—Scald and sweeten the fruit, beat it through a sieve, and put it into a tart-dish. When cold, pour a rich custard over it, about two inches deep; whip the whites of the eggs, of which the custard was made, to a snow, and lay it in small rough places on the custard; sift fine sugar over, and put it into a slack oven for a short time. It will make an exceedingly pretty dish.

To Clean Mirrors.—Wipe them lightly with a clean bit of sponge or fine linen that has been wet in the spirits of wine, or in soft water; then dust the glass with fine whiting powder; rub this off with a soft cloth, then rub with another clean cloth, and finish it with a silk handkerchief. Dust the frames with cotton wool.

To Sweeten Rancid Butter.—It is said that washing rancid butter in milk, and afterwards in water, will restore it to former sweetness. The experiment is easily tried, and the "consummation devoutly to be wished," for surely nothing is more repulsive than rancid butter.

Mock Cream for Coffee.—Mix half a table-spoonful of flour with a pint of new milk; let it simmer for five minutes, then beat up the yolk of an egg, stir it into the milk while boiling, and run it through a lawn sieve.

Crullers.—One cup of sugar, one cup of sweet milk, two eggs, one table-spoonful of butter, one of cream tartar, one tea-spoonful of soda, roll and cut very thin, then fry them.

To take Ink out of Mahogany.—Mix in a tea-spoonful of cold water, a few drops of oil of vitriol; touch the spot with a feather dipped in the liquid.

To Dry Cherries and Plums.—Stone and halve them, then pack in jars, strewing sugar between the layers.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,
For the week ending June 6, 1854.

Brown S. Wood, of Burlville, R. I., for improvement in knitting machines.

Robert Waddell, of England, for improvement in balancing slide valves of steam engines. Patented in England April 27, 1853.

A. H. Rantch, of Bethlehem, Pa., for improvement in machines for washing bottles.

Chas. F. Brown, of Warren, R. I., for improvement in instruments for taking deep sea sounding.

Jos. de Palm, of New York, for improvement in brick pottery kilns. Patented in England, July 13, 1852; in France, Aug. 13, 1852; in Holland and Belgium, Sept. 15, 1852.

Henry R. Campbell, of Lebanon, N. H., for improvement in the combination of a railroad truck and wheels.

Samuel McCormick, of Dublin, Ireland, for improvement in pressing the thread upon screw blanks. Patented in England, March 22, 1853.

Donald Taylor, of East Boston, for bevel kneel former.

Henry Allen, of Norwich, Conn., for improved machine for dressing polygonal timber.

Wm. Ballard, of New York, for improvement in bent timbers for ship frames.

Whitman Price, of Goldsborough, N. C., for improvement in cultivators.

Jared Pratt, of Taunton, Mass., for improvement in making seamless metal tubes.

Wm. W. Hill, of Greenport, N. Y., for arrangement of dampers in rotary stoves.

Walter Westrup, of Wapping, England, for improvement in grain mills. Patented in England, January 22, 1850.

Mathias P. Coons, of Brooklyn, N. Y., for improved rivet clamp for wire fences.

W. A. Flanders, of Sharon, Vt., for moth killer.

Ross Dugan, of New York, for improved machine for cleaning and watering streets.

Edward and James M. Clark, of Lancaster, Pa., for improvement in flouring mills.

Smith Beers, of Naugatuck, Conn., for improved method of turning hubs, &c.

Timothy F. Tash, of Worcester, for improved device for operating cutter heads of planing machines.

Alfred Braly, of New York, for improvement in vault covers.

Noah W. Speers, of Cincinnati, for improved hydrant cap.

James A. Whipple, of Boston, for improved mechanism for operating pumps.

Samuel H. Dudley, of Milton, Conn., for improvement in road scrapers.

Edward P. Day, of New York, for improvement in machines to print subscribers' names, &c., on newspapers.

Francis M. English, of Hopkinsville, Ky., for improvement in whiffletrees.

Robert M. Wade, of Wadesville, Va., for improved lubricator.

Alexander B. Latta, of Cincinnati, for improvement in steam generators.

Charles F. Martine, of Boston, for improvement in sofa bedsteads.

Hymen L. Lipman, of Philadelphia, for improved eyelet machine.

Elijah Phelps, of Hendersonville, Ill., for improvement in excavators.

Wm. B. Johnson, of Staunton, Va., for improvement in seed planters.

Patrick Clark, of Rahway, for improved water level indicator for steam boilers.

Thos. and Saml. Champion, of Washington, D. C., for improvement in feathering paddle-wheels.

Waitman Davis, of (near) Morgantown, Va., for improvement in seed planters.

John Shetfield, of Pulneyville, N. Y., for improvement in apparatus for filing mill saws.

Robert H. Collyer, of New York, for improvement in gold amalgamators.

Isaac R. Shank, of Buffalo, Va., for improved lath machine.

David Russell, of Brewersburgh, Ind., for improved method of operating saw-mill blocks.

Harrison C. Clark, of Worcester, Mass., for improved lathe.

Thos. Crossley, of Boston, for improvement in weaving cuttle fabrics.

William Cann, of Black Rock, N. Y., for cleaning bolts of flouring mills.

Edward Harrison, of New Haven, Conn., for improvement in grinding mills.

Jordan L. Mott, of New York, for improvement in securing car-wheels upon axles.

Edwin J. Green, of Cedarville, for improvement in joint bodied buggies.

Levi Dederick, of Albany, for improvement in hay presses.

James J. Johnson, of Alleghany, and James V. Cunningham, of Pittsburgh, for improvement in moulding hollow ware.

John C. Reed, of Mount Vernon, Ohio, assignor to C. P. Buckingham and Henry P. Upton, of same place, for improvement in grinding mills.

Harvey Ely, of Rochester, assignor to Samuel B. Ely, of same place, for improvement in drying flour.

Thos. Wallace and Henry Bachreister, (the latter now deceased,) of Philadelphia, for improved blowing fan.

Dennis Donovan, for himself, and as administrator of Witchell G. Hallman, deceased, now, and late of Philadelphia, assignor to H. J. White, of Philadelphia, for improvement in cooking range.

Improvement in Fire-Alarms.—Mr. Henry Cobham, of Pennsylvania, has invented a very ingenious instrument for alarming a household or neighborhood, in case of fire. The instrument is hung upon the wall of an apartment. A small piece of wax is placed between the wheels. In case of fire, the temperature of the room being raised a few degrees, the wax melts, and the wheels strike an alarm-bell.

These instruments can be made at a very small cost, and will produce an alarm in proportion to the size of the gong.—*People's Journal.*

Corn-Stalk Cutter and Harvester.—Messrs. Cole and Hemrighous, of Fairfield County, Ohio, have invented an improvement for cutting and harvesting corn-stalks, which possesses the advantages of simplicity and convenience. The machine resembles a common, but low-wheeled cart. The cutting knives are secured to and revolve upon an upright shaft, so placed in front that as fast as the stalks are cut down they fall over into the cart body.—*People's Jour.*

CONSUMPTION OF SMOKE.

At the usual meeting of the Society of Arts, last week, Dr. Neil Arnot read a paper on a new smoke-consuming and economical fire-place. He showed the great evils connected with common coal fires; how London smoke increases the cost of washing by a million and a half sterling per annum, destroys clothes, furniture, books and paintings, kills plants and trees, and is inimical to health. In an ordinary fire, five-sixths of the heat goes up the chimney with the smoke. To save a third part of the coal burned in London alone, would save nearly a million sterling a year. Dr. Arnot gave this description of the new fire-grate:—The charge of coal for the whole day is placed in a box immediately beneath the grate, and is borne upwards as wanted by a piston in the box, raised simply by the poker used as a lever, and as readily as the wick of an argand lamp is raised; and the fire is under command, as to its intensity, almost as completely as the flames of a lamp. The fire is lighted with singular ease and speed. The wood is laid on the upper surface of the fresh coal filling the coal-box, and a thickness of three or four inches of cinder or coked coal, left from the fire of the preceding day, is placed over it. The wood being lighted, instantly kindles the cinders above, and at the same time the pitchy vapor from the fresh coal below rises through the wood-flame and cinders, and becomes heated sufficiently to inflame itself, and so to augment the blaze. When the cinder has once fairly ignited, all the bitumen rising through it afterwards becomes gas, and the fire remains quite smokeless for the remainder of the day. Great advantages would result; there would be no more smoky chimneys, no more flues on fire, no more chimney-sweeping, and there would be capital ventilation.

ORNAMENTING GLASS.

A novel system of ornamentation in glass, porcelain, and metal, has lately been patented in England, by Mr. W. Johnson, on behalf of M. Gellee, of Paris. It is by a species of incrustation, or inlaid work, that the invention is worked out, pieces of glass of different colors being laid one upon the other, and united into one mass by heat; such composite masses are then softened in an enameling furnace, and a device—as a rose, for instance—is then impressed upon the upper surface of the glass by a die. Supposing a layer of purple glass is, in this case, laid upon a blue layer, the die will impress the purple glass with the body of the blue layer, at the same time cutting out the glass to the intended shape of the brooch or other ornament to be made. The design so produced is in *intaglio*, and the process is continued upon it by grinding flat, and removing the superfluous glass, or that which has not been impressed by the relief surface of the die. The piece of glass is then polished and finished, when it presents a perfectly smooth face, formed by a blue ground, with a purple flower in it. Instead of this process, a similar effect may be produced by impressing the figure on a piece of glass of one color, and then uniting a second color by heat. By another modification, the figure is punched out of one color, and inserted into a corresponding hole in another, any number of colors being thus incrusted at pleasure.

IMPORTANT DISCOVERIES.

It may not be generally known, that by the process now in common use for removing the hair and tanning hides, a period of about six months is consumed, and the leather is liable to be burnt and rendered brittle by the lime used in its preparation.

An article has been discovered by Messrs. Ward & Root, of Boston, and thoroughly tested by those interested in the tanning business, by which the hair is removed and the hide left in such a state that it may be tanned in eight days; and, what is of more importance than this saving of time, the leather is left soft and is capable of more service than when treated in the common way. This article is coming rapidly into favor, and the new process must soon supersede all now practiced for the tanning of leather.

The same firm have also discovered a way of scouring and fulling woolen goods, by which the use of soap for this purpose is entirely done away with, and a saving effected of over one-half. This latter process we have heard very highly spoken of by manufacturers who have tried it, and on their authority we do not hesitate to recommend it as being exactly the thing it is claimed to be.—*Banner of Industry.*

WHITEWASH.

Remember that whitewash is one of the finest things in the world to promote cleanliness and health. Old buildings, the coverings of which may not be worth the expense of a coat of paint, and which are so unsightly that you are justly ashamed of them in their present condition, may be made to appear almost like new work by the application of a few cents of whitewash. Fences around the house should be washed or painted, also the interior of all out-buildings, barns, sheds, hen-houses, granaries, &c., and the walls of the cellar, as well as the overhead ceilings of the rooms in the house. A liberal use of this sanitary material is of great consequence; lime being a powerful disinfector, and highly efficacious in promoting health at all seasons of the year. Powdered lime sprinkled over the bottom of the cellar after the roots are removed in the spring, and repeated occasionally through the season till cold weather, will prevent the unpleasant odor ordinarily engendered by warmth, and keep the atmosphere pure and sweet.—*N. E. Far.*

Improved Plow.—Mr. L. G. Evans, of Alabama, has made an improvement in plows, relating, chiefly, to the mould-board, which is made adjustable. By turning a couple of convenient nuts, the mould-board is thrown out or in at pleasure, altering the width of furrow and weight of draft as desired.—*People's Jour.*

Educational.

THE REASON WHY.

The reason why a wide diffusion of intelligence and education is especially necessary in a country like ours, is the fact that the responsibility of the government, and all that relates to the making and the administration of the laws, is in the hands of the people. In an Autocracy, where the power is concentrated in a single person, and his mandates are executed by agents responsible only to him, it is not necessary, so far as the body politic is concerned, that the people should be removed intellectually more than a step above the brute creation that surrounds them; indeed, a greater degree of intelligence among the mass of subjects would endanger the stability of the political fabric, and result in a revolution. Ignorance and blind obedience are yoke fellows and inseparable companions; and where the former prevails, the latter will be found at last. In an Aristocracy, it is necessary that a class be educated, and fenced around with an armor of superior wisdom, while it is for their especial interest, and the perpetuity of their peculiar privileges, that the common people—the hewers of wood and the drawers of water—should know just enough to hew and draw, and no more. Nothing tends more inevitably to break down special privileges, and open up to all men the common rights of humanity, than education of the masses. The son of a grocer or a mechanic, who is sent to school with the son of a Peer, and finds himself equal to the latter, both mentally and physically, enquires why the same road to distinction in the wide world is not equally open to him. He sees the other inheriting broad fields, and in the possession of rent-rolls fettered by entail, and handed down from generation to generation; a seat, by right of birth, in the upper house of legislation, from which he himself is shut out by the enactments of positive and unjust laws. The majority of his countrymen are in the same situation with himself, and if they are equally as well educated, they are also equally discontented. Hence, they form themselves into a league for the overthrow of these unjust and unequal privileges, and the result is, that they ultimately triumph. Sometimes, as instanced in the French revolution they triumph in crime and blood. One man, or one hundred, cannot, for a long series of years, maintain positions above a thousand other men equally competent with themselves; and if the door is not opened to the latter, they will batter it down by force. They form themselves into a corps of sappers and miners, and dig out from its lowest foundations the strong-built walls of Aristocracy. Such has been the process going on in most countries of the old world, slow at times, and apparently ineffectual, it is true, but still advancing towards its consummation.

The House of Commons in Great Britain, even as late as the time of Queen Elizabeth, was scarcely of any weight in the kingdom; they "humbly petitioned her Majesty" so and so, and gratefully received as favors the crumbs of legislation that came from the table of the Queen and the House of Lords. Now the Commons is the giant arm in England, wielding alike the mace of office, the sword of justice, the keys of the treasury, and the engines of war. They make and unmake the ministry; and the veto even of majesty itself has not been interposed to invalidate their acts for a period of a hundred and fifty years; and the reason only is, that the people, becoming educated, understand, and dare maintain, their rights. England has been, and is still, slowly but surely, approaching a Democratic form of government. Louis XIV. of France, once said, "I am the State"; and Louis the XVI. not many years later, was brought to the block. Revolutions and counter revolutions have succeeded, and despotism has, from time to time, partially triumphed. A lack of general intelligence, and a diffusive system of education among the people, is the reason why.

Our own country comes nearest of any in existence to a free and untrammeled state, where every citizen is equally at liberty to act and to rise; and the reason why is, the high state of intellectual and moral culture among the people. The patent of nobility recognized, is that of superior intellect, stamped only by the Creator. The people are the Sovereign, and the officer the servant. No privilege or emolument is given to one man by right of birth, which is denied another. A general diffusion of knowledge—*the leveling up, not down*, of the whole people—is the key to the triumph of Democracy in its widest sense; and those who fear despotism, either in church or state, must make double efforts to promote the cause of general education. The alternative is ignorance and despotism, or intelligence and freedom.

The number of self-supporting day schools in England is 30,524; number of scholars, 721,396. The aided public schools are 15,518; number of scholars, 1,422,982.

EDUCATIONAL EXHIBITION.

The Society for the Encouragement of Arts, Manufactures and Commerce, in London, have determined to hold an Exhibition of Educational Apparatus on a large and complete scale, this month, and have taken steps to make known to the governments of foreign countries the object the Society has in view, in order that the Exhibition may represent to the people of England the state of education in France, Prussia, Holland, Sweden, Denmark, Belgium, Switzerland, the United States of America, and the British Colonies.

It is highly important that this country should be fully represented in this exhibition, as there is but little doubt that the result will show *our* school apparatus in some respects better adapted and more serviceable than that employed in any nation on the globe.

Circulars giving all the necessary information to enable the friends of education in this county to exhibit articles have been received, from which we learn that goods can be shipped from New York or Boston as late as the 10th of June, and although the printed circular states that exhibitors must deliver their objects at their own charge and risk, we are assured on competent authority that the Society will make a liberal provision for the expenses of transportation.

The following is a classified list of objects which may be admitted:

Section I. Buildings.
Section II. Fittings and Furniture.
Section III. Apparatus and Materials.
Section IV. Books, Maps, Prints and Diagrams.
Section V. Results.
Section VI. Objects or Models and Drawings of Projects for supplying Desiderata.

All articles connected with the subject of Education, and all contrivances employed to impart instruction at the present day, may be sent forward. The exhibition is to be upon the broadest and most comprehensive scale.

Persons who desire to exhibit articles should make arrangements without delay. Mr. Chas. F. Stansbury, who acted as American Agent to the World's Fair in London, and who now resides there, has patriotically and liberally offered his services as agent for any person or school that may desire to send articles, *without any charge*. He will doubtless cheerfully impart any information on the subject of the Exhibition. His address is No. 17 Carnhill, London, and we doubt not his past experience will enable him to act with the greatest advantage at the present exhibition.—*N. Y. Tribune.*

EDUCATION IN MICHIGAN.

Michigan must ever claim the honor of being the first State in the Union, offering the student from all portions of the United States complete courses of Collegiate instruction, free of charge.

The annual income from her University fund is now about $25,000 per annum, and is increasing.

Ample buildings have been erected at Ann Arbor, for the Medical and Literary Colleges, a town remarkable for its health and cheapness of living.

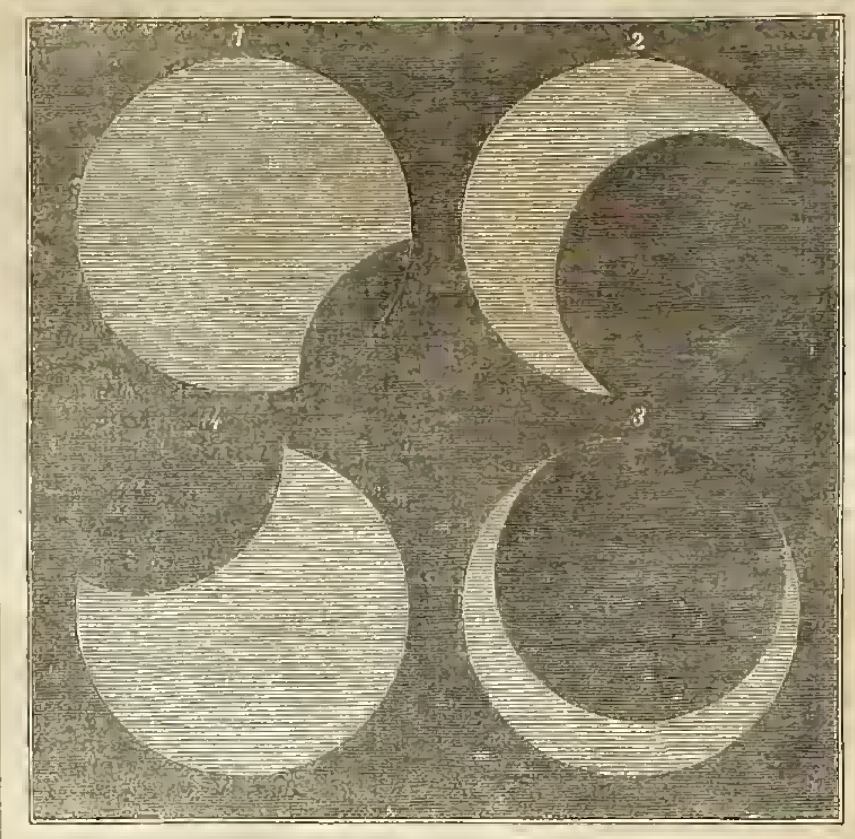
The University Library, Cabinet, Museum, Apparatus and Laboratory, are creditable to a State Institution, and one of the best Astronomical Observatories in the world is nearly completed, the directorship of which has been accepted by the distinguished Astronomer, Brunow of Berlin, the assistant of Encke.—The corps of Professors, (at present, ten in the Literary and six in the Medical Colleges, have thus far been culled from the different States, with reference to their ability and fitness. In the College of Arts and Sciences, there are two full parallel courses of studies, viz: Literary and Scientific. The first including such branches as are taught in other Colleges; the other, or Scientific course, omits the dead languages, and substitutes the Natural Sciences, Civil Engineering, &c., the better to fit young men for the practical duties of life, (to enter which but moderate pre-requisites are insisted on.) An appropriate degree is conferred on those who take a full course in either, but a student may take a partial course, selecting such studies as he may wish, and remain as long or short a time as he may desire. An agricultural course has been established, and is now in full operation.

The Collegiate year, in both Colleges, commences on the 1st of October, the term of the Medical College continuing six months.—*Mich. Argus.*

The Direction of the Youthful Mind.—How greatly do parents and preceptors err in mistaking for mischief or wanton idleness, all the little manœuvres of young persons, which are frequently practical inquiries to confirm or refute doubts passing in their minds. When the aunt of James Watt reproved the boy for his idleness, and desired him to take a book, or to employ himself to some purpose usefully, and not to be taking off the lid of the kettle and putting it on again, and holding now a cup and now a silver spoon over the steam, how little was she aware that he was investigating a problem which was to lead to the greatest of human inventions!

Learning vs. Discipline.—What is the use of battering a man's brains full of Greek and Latin pot-hooks which he forgets before he doffs his last round jacket or puts on his first long-tailed blue, if ye don't teach them the old Spartan virtue of obedience, hard living, early rising, and them sort of classics? Where's the use of instructing him in hexameters or pentameters, if you would leave him in ignorance of the value of a penny piece? What height of stupidity it is to be filling a boy's brains with the wisdom of the ancients, and then turn him out like an *omadhaun*, to pick up his victuals among the moderns!—*Blackwood's Magazine.*

Our adversaries think they refute us when they reiterate their own opinions without paying attention to ours.



VIEWS OF THE RECENT ECLIPSE.

[Engraved for Moore's Rural New-Yorker, from Daguerreotypes taken by John Kelsey.]

Useful Olio.

THE RECENT ECLIPSE.

The above cut represents the precise appearance of the late solar eclipse, at four successive periods of its progress, as seen at Rochester; figure 1 being near the time of its commencement, and figure 4 near that of its termination. Figure 2 represents its approach to, and figure 3 its period of greatest obscuration. The picture should be held so that the observer will be looking westward, or in the direction of the sun at 5 o'clock P. M., in order to give the eclipse its true position and direction. It was a remarkable phenomenon, and one of rare occurrence; and it was viewed in this locality under the most favorable circumstances. Not a cloud was visible in the sky, and the deep blue vault of the heavens had been cleared of all obscuring vapors a few days previously, by a storm. The eclipse touched the sun on its north-western limb, and gradually slid over the disk until about five-sixths of the surface was totally obscured, but at no period was there any annular appearance in this locality. The ring of light was observable on a belt of the earth's surface reaching from Washington Territory on the West, to the Atlantic, near Portland, on the East; but its Southern limit passed North of us through Canada. The outlines were beautifully and boldly defined, and unattended by any haze or other appearance of a lunar atmosphere, and it is generally believed by astronomers that none exists.

It is undoubtedly understood by all the readers of the Rural that a solar eclipse is caused by the moon in its passage around the earth coming between it and the sun, and thereby intercepting the light. It is consequently obvious that such a phenomenon can happen only when the three bodies are in one and the same straight line. But why, it may be asked, does not an eclipse of the sun occur at every revolution of the moon? Such would be the case, if the plane of the moon's orbit corresponded with that of the earth; but the former is inclined to the latter at an angle of five and a half degrees, and therefore one-half of the moon's orbit rises above, and the other half falls below, the orbit of the earth. There are two opposite points of intersection of the two orbits, where they cross each other, called the *nodes;* and the moon must be changing at or near one of these nodes, in order to interpose itself between the earth and sun. The two orbits and the nodes can be easily illustrated by nailing together, at opposite sides, two hoops, and then swinging them apart at an angle of five and a half degrees, when the points at which they cross each other at the nails, will represent the nodes, or the points at or near which the moon must be to produce either a Solar or a Lunar eclipse.

The sun being a body of larger dimensions than the moon, the shadow of the latter will be in the form of a cone, with its base resting upon the moon's surface, and its apex projected into the sky. At some part of the moon's orbit, which is elliptical with the earth in one of the foci, the shadow terminates before reaching the earth; in which case the eclipse, if central, will be annular, i. e., a ring of light will be visible around the moon as it passes across the sun's disk. Such was the appearance of the late phenomenon in those localities where the central shadow passed, while to us who stood outside of the central track, the uneclipsed portion of the sun assumed the appearance of a magnificent crescent, as shown in the foregoing illustration.

CREEPING THINGS.

Let me put a spider into any lady's hand. She starts back aghast. She shrieks, "the nasty ugly thing!" Madam, the spider is perhaps shocked at your Brussels laces, and, although you may be the most exquisite painter living, the spider has a right to laugh at your coarse daubs as she runs over them. Just show her your crochet work when you shriek at her. "Have you spent half your days upon these clumsy anti-macassars and these ottoman covers? My dear lady, is that your web? If I were big enough, I might with reason drop you and cry out at you. Let me spend a day with you and bring my work. I have four little bags of thread—such little bags! In every bag there are more than 1,000 holes—such tiny, tiny holes! Out of each hole a thread runs, and all these threads—more than 4,000 threads—I spin together as they run, and when they are all spun they may make but one thread of the web I weave. I have a member of my family who is herself no bigger than a grain of sand. Imagine what a slender web she makes, and of that, too, each thread is made of 4,000 or 5,000 threads that have passed out of her four bags through 4,000 or 5,000 little holes. Would you drop her, too, crying out about your delicacy? A pretty thing, indeed, for you to plume yourself on your delicacy, and scream at us."

Having made such a speech, we may suppose that the indignant creature fastens a rope around one of the rough points of the lady's hand and lets herself down lightly to the floor. Coming down stairs is noisy, clumsy work, compared with such a way of locomotion.—The things we scorn are miracles of beauty. They are more delicate than any ormolu clock or any lady's watch, made, for pleasure's sake, no bigger than a shilling.

Lyonet counted 4,041 muscles in a single caterpillar, and these are all a small part only of its works. Hook found 14,000 mirrors in the eye of a bluebottle, and there are 13,300 separate bits that go to provide nothing but the net of breathing in a carp.—*Dickens' Household Words.*

A FEARFUL HISTORY.

What if the history of a distiller could be written out—so much rum for medicine, of real value; so much as a tonic, of real value; so much for the arts, of real value. That would be one drop, I suppose, taken out and shaken from the distillery. Then, so much sold to the Indians, to excite them to scalp each other; so much sent to the Africans, to be changed into slaves to rot in Cuba and Brazil; so much sent to the heathens in Asia, and to the islands of the ocean; and so much used at home. Then, if the tale of every drop could be written out—so much pain; so much redness of eyes; so much diminution of the productive power in man; so many houses burnt, so many ships foundered, and railway trains dashed to pieces; so many lives lost; so many widows made doubly widows because their husbands still live; so many orphans, their fathers still living, long dying on earth: what a tale it would be! Imagine that all the persons who had suffered from torments engendered on that plague-spot, came together and sat on ridge-pole and roof, and filled up the hall of that distillery, and occupied the streets and lanes all about it, and told their tale of drunkenness, robbery, unchastity and murder, written on their faces and foreheads. What a story it would be! The fact is stranger than the fiction.—*Parker.*

Names of the Days of the Week.—The remains of the religion of the ancient people of Great Britain are seen in the names of the days of the week. These people were Scandinavians, who carried into Britain with them their arms, their deities and their religious rites. The Anglo Saxon superstition came from their progenitors, the Danes and Norwegians, and northern mythology was once the established religion of Great Britain. The names of the days of the week were called after the deities of this northern worship. Sunday is the day of the Sun; Monday of the Moon; Tuesday, of Teucer, the god of hunting and archery; Wednesday, the day of Woden, the god of war; Thursday, the day of Thor, the god of thunder; Friday, the day of Frigs, the god of love and marriage; Saturday, the day of Satar, the god of fruits.

Sunday Reading.

THEODORA.

In the silent hour of night,
When the moon was shining bright,
And the stars in silv'ry light,—

On the mountain, lake and rill,
Shone they most serenely still,
Chaining thus the heart and will.

It was thus when she did leave;
Mourning hearts did then bereave;
Thinking they should ne'er receive

That loved form to their embrace,
Never look upon that face,
Till with saints they take their place.

In the morning did she say,
"Will you bow by me and pray?
For I'm going home to-day."

She was clad in robes of white,
On that cold and beauteous night,
But her heart did feel no blight,

For her sorrows all were o'er,
She had only gone before,
To that bright, celestial shore.

When we looked upon her brow,
Which was cold and placid now,
Then we knew we too must bow,—

To the mandate, stern decree,
Which went forth to make us free
From pain, sin, and misery.

Normal School, Albany, May, 1854. E. N. E.

PRACTICAL APPLICATION.

A curious incident occurred, some twelve or fourteen years since, illustrative of the peculiar manner of Mr. Binney, when preaching in a chapel near London—delivering a charge to the People, on the Ordination of their Minister, he made some apparently irrelevant remarks upon the Duty of Christian Courtesy in the Temple of God, commenting upon the frequent inattention in allowing persons to stand in a place of worship, when there was room near at hand in the pews. And he would cite, he said, an instance from his own experience. He was preaching, he said, in a chapel not over crowded, and in one of the aisles of the chapel stood a young woman, apparently not too strong or robust, leaning upon a pew in which were only two young men—only two young men—and would you believe it, said the preacher, there they sat, and never opened the pew door for that young woman—there was no occasion for them to vacate their seat, although that might not have been too much in a crowded chapel, had they been gentlemen, and had she been a servant girl—no; there they sat. How strange the coincidence, continued the preacher, "it was just such a chapel as this—the aisle was just like yonder aisle—aye, it was just this day of the week too, just this day of the month, yes, and this very year—and in this very place—it is this very night—there is the place—there the aisle—there the pew."

It is not long since, at the anniversary of Chestnut College, upon the moving of one of the ministers beneath him, he said, "There now! I forget it! the creaking of that man's boots has put what I had to say quite out of my mind."—*Lamps of the Temple.*

RELIGION AND POLITICS.

The celebrated Robert Hall, in his admirable article entitled "Christianity consistent with a love of Freedom," uttered the following opinions, which are especially pertinent to the present state of affairs among us.

"Though Christianity does not assume any immediate direction in the affairs of government, it inculcates those duties and recommends that spirit which will ever prompt us to cherish the principles of freedom. It teaches us to check every selfish passion, to consider ourselves as parts of a great community, and to abound in all the fruits of an active benevolence. The particular operation of this principle will be regulated by circumstances as they arise, but our obligation to cultivate it is clear. * * If we are bound to protect a neighbor or even an enemy from violence, to give him raiment when he is naked, or food when he is hungry, much more ought we (ministers) to do our part toward the preservation of a free government, the only basis on which the enjoyment of these blessings can securely rest. He who breaks the fetters of slavery and delivers a nation from thraldom, forms in my opinion, the noblest comment on the great law of love, while he distributes the greatest blessing which man can receive from man; but next to that is the merit of him who, in times like the present, watches over the edifice of public liberty, repairs its foundations and strengthens its cement, when he beholds it hastening to decay."—*Christian Intelligencer.*

Elegant Extract.—The grandeur of man's nature turns to insignificance all outward distinctions. His powers of intellect, of conscience, of love, of knowing God, of perceiving the beautiful, of acting on his own mind, on outward nature, and on his fellow creatures—these are glorious prerogatives. Through the vulgar error of undervaluing what is common, we are apt, indeed, to pass these by as of but little worth. But as in the outward creation, so in the soul, the common is the most precious.

Science and art may invent splendid modes of illuminating the apartments of the opulent; but these are all poor and worthless compared with the common light which the sun sends into our windows, which he pours freely, impartially, over hill and valley, which kindles daily the eastern and western sky; and so the common lights of reason, and conscience, and love, are of more worth and dignity than the rare endowments which give celebrity to a few.—*Channing.*

Give unto the Lord the glory due unto his name; worship the Lord in the beauty of holiness.—*Bible.*

Miscellaneous.

[Written for the Rural New-Yorker.]

MORNING AND EVENING.

How pleasant 'tis at early dawn,
When all is pure and fair,
To wander o'er some shady lawn
And breathe the balmy air.
All nature then with joyous lay,
Rejoices at th' approach of day.

'Tis then the sun with soften'd ray,
Its golden light reveals;
And from the plants and flow'ry shrubs
The pearly dew-drop steals.
Oh! greet the morn with songs of love
Pure as the azure sky above.

The flowers that drooped o'er mossy beds,
Down by the sparkling brook,
Now raise in joy their tiny heads,
With beauty in each look.
The flaming orb rolls on its way,
And morn is verging into day.

The sun is sinking in the west,
Its splendor fades away;
The moon appearing in the east,
Bespeaks the close of day.
'Tis twilight; yes, that mystic hour
Has settled o'er the summer bower.

The stars in beauty now appear,
Sweet jewels of the night;
The moon, "fair empress," too, is there,
Dispending silver light.
The songsters now have quit the bower,
And naught disturbs the quiet hour.

The brook that flowed so gaily by,
Is silvered o'er with light;
The flowers that blossomed on its banks,
Have closed their petals bright.
All nature's hushed in sweet repose,
And eventide's breeze now gently blows.

This is the time for pursed thoughts;
Then let those thoughts arise,
And fill the mind with jewels bright
As stars, that gem the skies.
But twilight fades; its silver light
Is wailing deeper shades of night.

Reed's Corners, N. Y. N. B.

DIFFERENCE OF OPINION.

"Look at that loafer with a straw hat, and pantaloons tucked into his boots; he must be a rare specimen of the *genus homicum*, worth preserving in a cabinet of Zoology;" observed an individual standing on the side-walk of a country village, and pointing to a man approaching on foot. The latter was apparently weather-beaten, and tanned by out-door exposure; not over scrupulously dressed, and with a pair of mud soiled boots reaching above his knees, into which his pantaloons were thrust. He walked along with a kind of rolling gait, as if inclined to favor the muscles of his legs as much as possible by aid of those of his body, like one who had much service for them to do, and wished to keep them in good condition.

"You call that man a loafer, do you?" responded the other. "Of course I do! Isn't he dressed like a loafer; does he not walk like a loafer; and does not his appearance in every particular betoken the loafer?"

"No! you might possibly say his dress betokened poverty; and yet it does not look like that either; and as for his appearance, it indicates anything but the class mentioned. He is passing us even now, and we see the flash of an eye that speaks a giant mind. His tread and bearing cannot be tortured on near inspection into anything pertaining to that species of degraded humanity."

And who, dear reader, do you imagine was the individual of whom such contradictory opinions were entertained? It is unnecessary to decide the point in any other way than by giving a glance at his history, and then leaving each one to draw his own conclusions. He was the son of a poor woman, and she was a widow. He worked in a mill for eight years of his early life, through the busy season of grain grinding in the fall and spring; and in the winter and mid-summer went to a district school for a portion of those years. Towards the last, however, he walked two miles to an Academy in the nearest village, where he acquired an excellent knowledge of drawing and the mathematics. His funds at this time running low, and the water in the streams running low also, so as to prevent his returning just then to his trade, he hired himself out to the chief of a party of engineers as peg-driver, in running a railroad line. His intelligence and aptness soon obtained him promotion to the post of rodman, that is to say, the bearer of the target at which the leveler directs his sight. The chief was absent with the transit, and the leveler in close pursuit, when at a moment of great hurry, the latter was taken suddenly ill. What was to be done? the line was to be run speedily, and the work put under contract, for the railway admitted of no delay.

"I think," said our rodman to the chief, modestly, "I can handle the level, at least sufficiently well to answer until another man can be obtained."

"You!" responded the chief; do you know anything of mathematics?"

"Yes, something."

"Have you ever studied Algebra?"

"Yes; I am familiar with that, and also Geometry and Trigonometry. I have studied Surveying and Mensuration likewise, and on leaving school was engaged on Davies' Analytical Geometry and Conic Sections."

"I am surprised!" exclaimed the chief; "why have you not told me of this before? take hold of the level, and if you find any difficulty in the practical management of the instrument, call on me."

As might be expected, where the practice was wanting, although the theory was understood, the new leveler did call for instructions now and then; but he was apt and ingenious, and in a few days even surpassed his predecessor.

"He can keep up with the transit," remarked one of the axe-men of the party, "and that is what his predecessor could not do."

He was yet a young man, at the time the remarks at the commencement of this paper were made of him, but he had risen to the post of resident engineer, and was receiving a salary of fifteen hundred dollars a year: while at the same time the pert young fellow in broadcloth, with lily fingers, and spindle shanks encased in tight pants of a volcano pattern, who made those remarks, was a dry goods clerk on a salary of sixteen dollars a month; but he was a love of a man (so it was said,) and an especial favorite of certain silly, polka-dancing young ladies. He, of course, was not a loafer; although while off duty behind the counter, he was seen frequently lounging in saloons or at street corners, peeping under ladies' bonnets, and making remarks upon passers-by.

GOING DOWN.

Who is there that has not noticed in his metropolitan experience the man who is going down? From day to day you trace him in his mournful descent of the declivity of life. He falls by inches, and his clothes are the barometer of his pocket. You do not know him.—His name, profession, origin and misfortunes, are all profound mysteries to you. You have simply a street acquaintance with him—that is to say, you have watched him going down.

You first see him some fine June day, marching up Broadway in a resplendent toilette. His hair is twirled into oily black ringlets; a Californian chain hangs from his fob, and terminating in heavy seals, swings pendulously against his knee. His hat has a curly brim. His moustache is small, black and thin. His waistcoat, of the celebrated volcano pattern, containing a landscape of Vesuvius in full eruption, harmonizes well with his green coat with gilt buttons. His cane, his patent leather boots, his embroidered shirt with a diamond pin, (rendered unnecessary by gold studs) thrust through the bosom, all bespeak a gentleman earning, if not an honest, at least a sufficient livelihood. You are attracted insensibly by the air of *insouciance* on his countenance. He looks so glossy, so smooth, so easy, that it would seem as if Nature had polished him up, and rounded his angles off expressly that he might slip the more easily through life. You begin to wonder who he is. He is not a Californian, that is evident by his jaunty dress and city walk. He is not a man of society, because he has no companions, and seems to know no one. Occasionally you see him standing on the steps of Florence's, talking to men of a similar stamp to himself; but they are not his friends—they have merely encountered perhaps in the way of trade. At last you come to the conclusion that he is a gambler. Yes! there is a glassiness about the eye that betokens late hours. The volcano waistcoat and gold chain, too, all gamblerish. You settle in your mind that he is a horrid Moloch devouring young men's means and passing his nights before a green-cloth-covered table, dealing out misfortune to a fevered company. You have not much respect for such a man, and pass on.

You notice in a little while a slight change in this individual's appearance. The chain has gone—the curly brim of the hat has become rather limp, and it shines no longer with its wonted splendor. The jaunty air, however, still continues, and what the hat wants in newness is supplied by an extra cock. The diamond pin still flashes to the sunlight, out of a shirt bosom that gives indications of a week's wear at the very least. Something certainly has gone wrong with the man. Probably a run of ill-luck has deprived him of his ill-gotten gains. But you have settled that he is a gambler, and pass on unpityingly.

The next change you observe about him is a buttoning up of the coat, and a hole in his patent leather boots. Coetemporary with these epochal marks, there comes a sadness and dejection over his countenance. He still walks Broadway, still swings his cane; but the old life is gone. He no longer gazes at the pretty women with that dashing air for which he was once distinguished. The dye is half worn off of his moustaches, and the ringlets no longer shine with oil. The diamond pin has vanished, and a huge, shirt-hiding scarf supplies its place. There is a wolfish, eager look about his eyes too, that would almost lead you to imagine that he was hungry. You open a little corner of your heart for him at this period, and begin to have some pity.

Thenceforward his fall progresses rapidly.—He gets a shabby old cloak to cover the deficiencies of his raiment. His boots are melancholy spectacles of ruined elegance. Beneath his old shrunken trousers you see their morocco tops shine, but the feet are broken and ragged, and the heel is off of one. He grows thin, and shaves no longer. The hat begins to collapse, and is no longer cocked, as if the poor owner knew it was no use to battle any further against appearances. He gives up promenading Broadway, and you see him now standing disconsolately at the corners of obscure streets. Poor fellow he is going very fast.

You now catch rare glimpses of him. He skulks in his walk, and only appears occasionally. You begin to wonder where he has gone to, whether he has retired like the rats to die in solitude, or whether he has gone on a whaling expedition. One cold winter's day you meet a mournful file of withered, chilly, red-nosed men, carrying great placards, on which are glaring announcements that on some evening in the ensuing week, Signor Hokuspocussini, the celebrated Wizard of the North Pole, will positively give his last entertainment. As the weather-beaten procession files slowly past, and you wonder if the icy countenances of those unhappy men will ever get warm again, our familiar face, glooming from under the gold and crimson tufts, arrests your eye. A second glance convinces you of its identity.—Chains, boots, pins, hats, all gone. Moustache shaven off. Ringlets out of curl. There is your Broadway friend, in a suit of thin, ragged frieze, with chilblained hands and blue cold lips, actually carrying a placard!

The descent is accomplished—and the poor fellow whom you have watched for such a length of time going down, has reached the bottom.—*N. Y. Tribune.*

MARRIAGE IN SYRIA.

The men marry at sixteen and eighteen years of age, the girls at twelve and fourteen. A girl who has arrived at the age of eighteen without marrying, is considered an old maid. The parents make the matches, the young folks have nothing to do in the matter, it being none of their business. If the mother sees a girl with whom she is pleased, she dispatches her husband to the girl's father to make proposals for their son. If not rejected, and the match is satisfactory, an agreement of marriage is entered into by the fathers. The engagement lasts for three months, during which time the young man and young woman are entirely ignorant of each other, the one never having met or even heard the name of the other. On betrothing, the young man sends jewels, &c., and it is on the value of those gifts that the parents of the girl regulate their gifts to the daughter. If the man wishes to break the engagement, he can do so, but loses the presents. If the parties have ever, by chance, seen each other before, they must not do so after they are betrothed. It requires three days to consummate the marriage ceremonies, commencing on Friday and ending early on Monday morning.

The interval is a festive occasion, when every body shouts and chatters confusedly. The men have their musicians, and the young women their songstresses and dancing girls, to enliven them. Wines, presents, and oriental sweetmeats are supplied by the bride and bridegroom, who become stewards for the time.—Both men and women smoke during the festivities. On the eve of the marriage, the bridegroom sends fifteen of his relatives to accompany the bride to church. On arriving at her father's house, she is demanded, and the company go down and smoke while she is being prepared. The bride, in going to church is accompanied by as many women as the bridegroom sent men, and rose water is sprinkled on the party from the windows of the houses as they proceed to church. When the ceremony is performed, the married couple do not return together. The bride is taken to the bridegroom's house. When the latter approaches the house at 12 o'clock at night, his friends cry out, "behold, the bridegroom cometh," and hence the Scriptoral expression.

The Tomb of Lafayette.—A recent letter from Paris contains the following extract:—

"We went in the direction of the Faubourg St. Antoine, and as it was not very far from the Rue Picpus, and I wanted to see the grave of Lafayette, and S—— having never seen it, we drove thither. It is not far from the Barrier du Throne. It is a very small, obscure spot, beyond a beautiful garden belonging to a body of *religieuses*. It contains the tomb of some of the oldest and most celebrated of the French nobility—the Montmorencies, &c. All the family of Lafayette repose here. He is side by side with his wife, and at their head is the stone slab of G. W. Lafayette. They are all mere stone slabs. Lafayette's is the last, close by the wall, and rests on stones and pebbles. Not a single blade of grass grows near it. I felt sorry to see it look so neglected. I asked our guide if it was visited by many people. He said, 'No; sometimes the Americans visit it.' I thought it was very strange."

Flowers.—How the universal heart of man blesses flowers! They are all wreathed round the cradle, the marriage altar and the tomb.—The Persian in the far East delights in their perfume, and writes his love in nosegays; while the Indian child of the far west claps his hands with glee as he gathers the abundant blossoms—the illuminated scripture of the prairies.—The Cupid of the ancient Hindoos tipped his arrows with flowers, and orange buds are the bridal crown with us, a nation of yesterday.—Flowers garlanded the Grecian altar, they hung in votive wreaths before the Christian shrine. All these are appropriate uses. They should twine round the tomb, for their perpetually renewed beauty is a symbol of their resurrection. They should rest on the altar, for their fragrance and their beauty ascend in perpetual worship before the Most High.

A Pungent Retort.—Said once a purse proud rich man, just getting into his carriage, with his wife and daughters flaunting in velvet and furs, to a poor laborer, who was shoveling coal into his vault:

"Joe, if you had not drunk rum, you might now have been riding in my carriage, for nothing else could have prevented a man of your education and occupation from making money."

"True, enough," was the reply, "and if you had not sold rum and tempted me and others to drink and become drunkards, you might now have been my driver, for rumselling was the only business by which you ever made a dollar in your life!"

The Great Tree of California, a section of which, 92 feet in circumference, now exhibiting in the Crystal Palace, has been estimated, by counting the circles of growth, to be upward of two thousand years old. It was 325 feet high.

Ladies' Department.

CONDUCTED BY A——E.

A LOVING HEART.

BY W. S. GAITNEY.

Sweeter than the sweetest flower,
Brighter than the brightest gem,
Richer far than Flora's bower,
Art or nature's diadem—
Fairer, sweeter,
Purer, meeter,
Is a kind and loving heart!

Wealth may prove a toy caressing;
Beauty's charms a world of light;
But affection is a blessing
From a soul serene and bright;
Kindest, purest,
Best and surest,
Is a faithful, loving heart!

Lady's Book.

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE SIXTH.

Brussels, March, 1854.

Dear Katey:—We have exchanged our quiet residence at Tirlemont for the gay capital; our French grammars and dictionaries are thrown aside, and our time is wholly devoted to amusements and sight-seeing. Brussels is frequently called Paris in miniature, and it is certainly a gay and brilliant city. The shops are magnificent, with their enormous plate-glass windows, and their displays of elegant and costly merchandise of every description. Broadway can show nothing superior to the princely establishments here, and I doubt if it can equal them. The toilettes of the ladies who promenade the streets, or saunter through the delightful Park which lies embosomed by palaces in the centre of the city, are exceedingly rich. One scarcely sees anything but velvet and satin, and the most expensive laces are worn with a profusion I never saw equaled before. New York belles dress more gaily, perhaps more tastefully, but no where have I seen ladies so richly attired as in Brussels.

In one of our promenades, we met several members of the royal family of Belgium, the Duke of Brabant, heir to the throne, with his young wife, an Austrian Arch-Duchess, and the Count of Flanders, younger son of Leopold. The Duke and the Count are two tall, slender young men, with an expression of countenance strongly suggestive of an embarrassing consciousness of being the objects of public attention, and as far removed as possible from anything like royal dignity. The Duchess is a rosy, chubby German girl, less *distingue* in appearance and in dress than the majority of the ladies who promenade the Park. She wore a silk, with enormous plaids, a brooche shawl, and white hat and veil. Those who met the royal party saluted them, the gentlemen by taking off their hats, the ladies by a half-courtesy. All the salutations were returned in the same manner in which they were given, a chimney-sweep receiving as gracious a recognition as the greatest gentleman of the court. The poor Duke did not have his hat on his head two seconds in succession during his whole promenade. This seemed to me to be paying rather dearly for the honors of royalty, and I fancied the gentleman himself looked as if he was of my opinion.

It is the Carnival, and masks are constantly circulating about the streets. These belong altogether to the lower classes, and are attired in the most grotesque and hideous manner.—One or more masked balls occur every evening, and attract crowds of the pleasure-loving; but the better class of people, even in the Catholic church, disapprove of the license and revelry of Carnival.

On Saturday last we went out to Waterloo. It is a pleasant excursion for a day. By taking a carriage from Brussels in the morning, we got back in time for "*table d'hote*" at five o'clock. When we approached the field of battle, we took up a guide who had been himself an eye-witness of the conflict, and from him we got a very good idea of the movements of the several armies on that memorable day. It is astonishing, Katey, what a different thing history seems to you when you read it tranquilly by your own fireside, and when you recall the stirring events which it narrates with your feet pressing the very earth where mighty hosts have met in deadly strife. The battle of Waterloo is something with which we are made familiar from our school-days; but our impression of it acquires a vividness and intensity unknown before, when we can say to ourselves, "Here stood Wellington—there, behind that little eminence, lay concealed the Life Guards, the last reserve of the British army, through all that sanguinary struggle, till the decisive moment when the welcome word of command, 'Up! boys, and at them!' rang through their ranks, and they burst like a tornado on the foe. Yonder, on that rise of ground, stood Napoleon through the long hours of that dreadful day, scanning with his glass the field of battle, and looking anxiously for the appearance of the delinquent Grouchy." Three times, as he said afterwards, at St. Helena, did he see the victory wrested from his hands, and here set the star of his glory forever.

The King of Holland has erected an immense mound of earth on the spot where his son, the Prince of Orange, fell. It is surmounted by a lion which stands looking towards France in a rather belligerent attitude, to the great annoyance of loyal Frenchmen, whose national pride this position touches in a tender point. There is also a monument to Gen. Gordon, near the centre of the field, and another erected by the Hanoverians to their companions in arms who fell here. The Prussians have placed a fine monument in that portion of the field where they made their appearance, and decided the fortune of the day.

We have also made an excursion to Antwerp, which was exceedingly interesting. The Cathedral there is a splendid specimen of Gothic architecture. The spire is 466 feet high, tapering up gradually into the clouds, till its delicate tracery looks like lace-work. We ascended it, 616 steps, and a weary way it was, I can assure you, but the view from the top repays one for the fatigue. In this spire is a chime of bells, the largest of which weighs 16,000 pounds. The machinery by which they are worked, is precisely similar to a music box. In the Cathedral are two celebrated pictures by Rubens, "The Descent from the Cross," and "The Elevation of the Cross." They have recently been submitted to the process of restoration, and are now quite fresh and brilliant. By the way, Katey, have you any idea in what this process of restoration consists? It is not a little curious, and I think you will be interested in an account of it. You must know these old paintings are all upon wood, the planks having originally had an inch or so of thickness, but in process of time this wooden back has become worm-eaten and decayed. The restoration consists, therefore, in a transfer of the paintings to new planks. First, the picture to be transferred is covered with a coat, perhaps half an inch thick, of a preparation composed mostly of mastic. The person who has invented the process, keeps secret the ingredients and proportions of this varnish.—Then the wood at the back of the picture is cut away, rapidly at first, and more carefully as they approach the painting. After all the wood has been removed, the new planks, carefully joined, and prepared with a coat of linseed oil, are applied to the under surface of the painting which has been exposed by the process just described. Sufficient time is allowed for the painting to become firmly attached to the new back, and then the varnish which was placed upon the surface is dissolved by means of a chemical preparation, the composition of which also remains a secret, and the picture is left safe and sound on its new foundation, ready to endure the assaults of another century or two. The government charges itself with these restorations, at an immense expense—10,000 francs, I have been told, for a single picture, after having assured itself, by repeated experiments, that the process was a safe one.

At St. Jacques, another church of Antwerp, which is exceedingly rich in its decorations, we saw the tomb of Rubens in a little chapel behind the high altar. Over the altar in this chapel is a painting by Rubens, where, under the title of a "Holy Family," he has introduced his own portrait, that of his father, his son, and his two wives. He has represented himself as St. George in armor, his two wives as Mary Magdalene and Martha, his father as Time, and his son as an angel. The picture has never been restored, but has hung undisturbed in this chapel more than two hundred years, and is still in excellent preservation. Rubens was born at Cologne, but his life was spent at Antwerp, and here his best works are to be found scattered about in the churches, and in the Museum, where is the most valuable collection of paintings we have yet seen. Van Dyck was also a native of Antwerp, and Quentin Matsys, who, from a blacksmith, became a painter, to win the lady of his love. The great charm of Rubens lies in the brilliancy and richness of his coloring. The outlines are not always correct; there is an exuberance of muscle, and his angels, in particular, are such puffed up, chubby little fellows, that you doubt whether they could maintain their equilibrium upon *terra firma*, much less float among the clouds where the artist has placed them.

But here I am, actually criticising Rubens. I am shocked at my own audacity, and humbly drop into silence. Your affectionate

Minnie.

Come When the Birds Sing.—The late Professor Caldwell, of Dickinson College, a short time before his death said to his wife:—"You will not, I am sure, lie down upon your bed and weep when I am gone. And when you visit the spot where I lie, do not choose a sad and mournful time; do not go in the shades of evening, or in the dark of night. These are no times to visit the grave of one who hopes and trusts in a risen Redeemer! Come, dear wife, in the morning, in the bright sunshine, and when the birds are singing!"

MOORE'S RURAL NEW-YORKER

ROCHESTER, JUNE 17, 1854.

Breadstuffs—Present and Prospective Prices.

Since the opening of the markets succeeding the last harvest, the prices of breadstuffs, particularly wheat, have gradually experienced an enhancement up to the present time. True, there have been periods of recession, when it seemed that prices had reached the culminating point, and commenced going down; but the decline was soon arrested, and the high figure previously ruling, was again speedily reached and passed.

Unfortunately for many of our farmers, the enhancement above twelve shillings has accrued to the benefit of second and third holders, although a large number of the first named obtained higher figures for the produce of their wheat fields; and there are not a few who still hold on to their wheat, setting their mark at two dollars and a half. The highest fair offer for pure Genesee has not reached that point by ten cents a bushel, and the news by the last three foreign steamers shows a decided decline in breadstuffs abroad. In the mean time another, and it is to be hoped, by the blessings of a kind Providence, a bountiful harvest is rapidly approaching, when the hiatus which now undoubtedly exists in the wheat and flour market, will be amply filled. There is no probability that the price of grain or flour will go down at any time during the ensuing year to the low prices ruling in years past, neither is it probable that at any time it will go up to twenty shillings for wheat, or twelve dollars for flour. The vast and varied products of our country, and the successive harvests of other grains and fruits, will affect the wheat market, and supply with wholesome food any deficiency that may arise at home in consequence of an increased demand for American wheat abroad; and any holder of the grain, who retains it in his bin with the expectation of obtaining any better price than that now ruling in his own particular market, it is believed, hugs to his bosom a delusive hope.

Even allowing that a chance exists of wheat going up, at any time, above the prices offered for four weeks past, is it wisdom on the part of the holder to await that chance? It is worth something to insure against fire, the depredations of vermin and thieves; the chances of injury in a thousand ways, to which all perishable property is subjected. The interest of the money is worth something, and the extra chances of grain being lower instead of higher, is a forcible argument against holding it longer.

In plain terms, then, the best advice we can give to our friends, the farmers, who have grain still on hand, is to sell now. Prices have not materially declined, if at all, in our markets as yet; but if the harvest comes in as it promises, it will be quite likely to do so; and the man who has held his grain over a whole year, will then have ample cause to regret his avarice and folly. Prices are high enough as they exist today; and so noble a bird as can be now taken in the hand, is worth more than two that may, by a mere possibility, be in the bush hereafter.

To the consumer of breadstuffs, we would say: buy just enough from time to time to carry you through the few weeks yet remaining until harvest, and no more. The chances are in your favor for lower prices after that; and the tribute you are now paying to the speculator, will, in all probability, be at least partially abated.

The Wheat Crop.—The editor of the *Standard*, Salem County, Ohio, June 7, says:—"If the wheat should not be injured by the rust, there is every indication of one of the largest crops ever raised in this county."

A Virginia correspondent of the N. Y. *Tribune*, writes that paper that the joint worm has proved so destructive in some counties, that farmers are quite discouraged trying to grow wheat. In Fauquier County many fields will not yield a bushel to the acre. They say that the joint-worm is worse than the potato-rot in Ireland, for if the people were dependent upon that one crop, they would starve. It is only the guanoed fields that are worth harvesting.

Another, writing from Michigan, says:—"Our State will turn out a big field of wheat this season, and other things in proportion."

A letter dated Burlington, Iowa, June 2d, remarks:—"We never had a fairer show for farmers since Iowa became a State. Corn bids fair to exceed any previous year."

Good Deed.—On Tuesday, May 23d, the ladies of the village of Baraboo (Wis.) held a meeting, for the purpose of abating a monstrous public nuisance, viz: a set of tippling shops and saloons that were a disgrace to civilized community. Accordingly, it was determined to destroy the liquor by their own hands; and, forming a procession, they marched down the streets, entered the liquor shops, and seizing whisky and beer barrels, they summarily emptied the contents into the street. At one place they found the doors barricaded, and the inmates armed with guns to defend the place. A riot very nearly occurred, as the men at this juncture took sides for and against the women; but the sheriff appeared, read the riot act, and succeeded in quelling the disturbance, after it was promised that the grievances of the sober part of the community should be redressed.

The Wheat Crop—Prices, &c.

During the past week we have taken considerable pains to ascertain the facts relative to the appearance and prospects of the Wheat Crop in Western New York, and the information obtained induces us to believe the yield will be less than has been anticipated. Making due allowance for the exaggerations of "croakers," we are of opinion that the crop, as a whole, will prove decidedly inferior to that of last year. While it looks fair in some localities, in many others it is poor and "spotted," and it is believed the yield will be much below the average. The late drouth was quite injurious, though the recent rains have been favorable, and the crop will partially recover.

Whether this supposed deficiency will affect future prices, is problematical. Western New York cannot, as in former years, control the market,—and hence the prices of wheat and flour will depend greatly upon the yield in Ohio and other wheat-growing States, and the harvest in Europe. Though reports from the West, and Europe, are generally favorable, there is yet too much uncertainty, and too many contingencies (depending upon state of the weather, insects, &c.,) to safely estimate the crop, or form conclusions as to prospective prices. Our opinion is that wheat will, after harvest, command from $1,50 to $2 per bushel for several months.

Congressional.

Congress, during the week ending June 10th, did absolutely nothing except draw their pay. The Senate was not in session, owing to an adjournment for the purpose of having their chamber renovated for a summer session; and the House up to Wednesday, had no quorum. On Friday, after reading the journal, Mr. Faulkner, of Va., announced to the House the death of Hon. John F. Snodgrass, Representative from the 12th District of Virginia. Some eulogistic remarks were made by Mr. Faulkner and other members, and the House, as is customary, adjourned. The small amount of time the House was actually in session, was consumed by talkers on the subject of the Pacific Railroad—a project dead for this session, at least; and also in regard to Cuban annexation, not yet dead.

The Senate passed a resolution previous to its adjournment, that if the House concur, an adjournment take place until August. This will give the members an opportunity of going home to see their wives, and what is equally important, drawing from the treasury eight dollars for each twenty miles of the distance traveled, as extra mileage. Truly, this is a great country!

Fatal Accident.—Last week Thursday, a little son of Garret Denow, of Farmington, Ontario county, was crushed to death beneath a heavy drag, which had been propped upon its side, and fell upon the lad when no one was near to witness the accident. These death-traps, and others of a like character, are quite common around farms and farm-yards accessible to children; and not unfrequently they result in like lamentable consequences. Many children have been killed by cart bodies dismounted from the wheels, and canted up against fences and the sides of buildings. Let farmers take warning from such accidents, lest similar ones occur in their own families.

Canadian Reciprocity.—It is generally believed, although the facts have not officially transpired, that a commercial treaty has been negotiated at Washington, which, if confirmed by Congress and the British and Colonial Government, will be highly advantageous to all parties. Among its terms are free trade in raw materials between the United States and the Provinces, free navigation of the St. Lawrence, and free use to Americans of the Province coast fisheries. The latter has been a vexed question for several years, and at one period of great excitement, gave Mr. Webster, just before his death, occasion to say to his neighbors, "Our fishermen must be protected, hook and line, fish and sinker!"

The New Hampshire Legislature.—The New Hampshire Legislature met and organized at Concord June 7th. Democratic officers in both branches were chosen throughout—in the House by a very close vote, the Whigs and Freesoilers coalescing against the Administration Democrats. The vote stood on the Speaker, 155 Democrats, 153 opposition. Last year the Administration had over 90 majority in the House—the change now being occasioned by the Nebraska bill.

The Legislature adjourned over a few days after receiving the Governor's message. Two U. S. Senators are to be chosen, both of which will probably be Administration men.

Indian Wars.—The Indians in Western Texas are committing depredations extensively on the frontiers, and threatening a general war. Wild Cat, the Seminole chief, heads the Indians, and several squads of government troops, as well as emigrants and settlers, have been cut off, and large numbers of cattle and horses driven away.

The Indians have been heard to say that they will kill everything, and desolate the country to the Rio Grande, and a good deal of excitement and alarm exists in consequence.

☞ The Argus estimates the total receipts for canal tolls during the fourth week of the month of May, at $130,000, which makes the aggregate for the month, $502,487.11, against $403,558.18 same time last year.

Our Albany Correspondence.

Albany, June 12th, 1854.

The State Department of Public Instruction have finally had rooms assigned to them in the basement of the State Hall. The Superintendent, Victor M. Rice, Esq., has got himself fully initiated, and will commence his visitations in different parts of the State very soon. The Department will lose the services of Samuel S. Randall, Esq., as Deputy, on account of his appointment to the Superintendency of Schools in New York city. Mr. J. J. Chamberlin will be his successor, and another clerk will be appointed in Mr. C.'s place. The clerk hire is limited to $3,000, of which $1,500 goes to the Deputy, $1,000 to the second clerk, and $500 to the third. After the organization is fully perfected, and the neglected business put in shape, active measures will be taken to advance the cause of education in general.

The Whig leaders in Albany have had a falling out. The General Whig Committee recently elected, was nearly equally divided, and failing to agree on an organization, they appointed two sets of officers, and unless some galvanizing process is devised, a nice time may be expected.—It is unnecessary to mention that it is like much other political manufacturing, a personal matter, and unworthy of men. If it should result in breaking the spell attached to a *Whig General Committee*, and showing the people that each man should think and act for himself, and not fellow blindly the beck of self-constituted committees, whose *real* influence morally, intellectually or socially, is not worth the brown paper required to write their names on, it would be a paying operation. King Caucus, and the Hon. Mr. Pipe-layer, and the respectful Office Seeker have ruled the roost about long enough. Let them be dethroned, and the virtue, intelligence, and industry of the nation, sway the scepter in the triumph of right.

The great Musical Congress to come off in New York on the 15th inst., causes quite a stir even here. Many will attend from this place, and among them your correspondent, from whom your readers may expect an account of the proceedings. "Owr."

Women's State Temperance Convention.

The second annual meeting of the Women's New York State Temperance Society, assembled at Utica, Wednesday, June 7th. The attendance was quite large, comprising persons from this and adjoining States.

The Convention was called to order by Mrs. Vaughan, President of the Society, who read the Opening Address. Mrs. Fish, of Ontario Co., read the Annual Report of the Executive Committee, in which Gov. Seymour is described as a political Judas.

The Treasurer showed that the amount in the Treasury at the date of the last report was $246,37. Amount received during the year, $1,840.21. Total, $2,086,58. Expenditures during the year, $1,990.70. Balance in the Treasury, $86,92.

During the absence of the Business Committee, Miss Currie D. Filkins, of Rochester, briefly addressed the Convention.

In the afternoon, letters sympathizing with the object of the Convention, were read from Mrs. Nichols, of Vermont, and Mr. Gerrit Smith, of New York.

Mrs. Bloomer introduced a series of resolutions, denouncing Gov. Seymour's Veto as a wanton insult to the people, declaring the necessity for more vigorous action on the part of temperance people, and that this field is a particularly proper one for women.

Resolutions denouncing the use of tobacco as conducing to drunkenness, were also offered.

Mrs. Mary C. Vaughan, of New York, was elected President, sustained by thirteen Vice Presidents.

For Recording Secretary—Mrs. H. Attila Albro, of Rochester.

Corresponding Secretary—Mrs. Angelina Fish, of Victor.

Treasurer—Mrs. E. C. Marsh, of Rochester.

An Executive Committee of seven members was elected, after which the Convention adjourned till Thursday.

Canal Board.—At the meeting of the Board on the 6th inst., the State Engineer submitted a report in writing, concluding with the following resolution, which report and resolution were laid on the table:

Resolved, That the Enlarged Canal between Lockport and Rochester shall be constructed in conformity to the following described dimensions, to wit,—The bottom of the Canal at Lockport to be located eighteen inches below the top of the mitre sill of the lowest lock at Lockport, and descending two feet on a uniform declivity to the bottom of the Rochester Aqueduct, the prism to be so constructed as to admit of 7½ feet depth of water above the top of said mitre sill at Lockport, and 7 4-12 feet above the bottom of the Rochester Aqueduct, with a bottom width throughout of 52½ feet, and a surface width at Lockport of 75 feet, and at the west end of the Rochester Aqueduct 80 83-100 feet, giving a surface declivity in the whole distance of 3 8-12 feet. The prism from Lockport to Rochester to diminish uniformly in size, except in localities where a saving in expense will justify a wider and deeper channel.

Of the volunteer guard of the slave in the procession, the Boston Atlas thus speaks:—"A body of some one hundred and twenty-five individuals, (we cannot call them men,) who had offered themselves to the Marshall for duty, were drawn up in the form of a hollow square, in the centre of which was the poor fugitive, the U. S. Marshal and his officers. They were armed with pistols and drawn cutlasses. This body-guard was composed of the dregs of society; nearly all were blacklegs and thieves, most of whom have been, or ought to be, inmates of our prisons.

The Hotel business in New York has been overdone, and it don't pay near as well as it did one or two years ago. This is principally owing to the rivalry from the multitude of second class hotels, or large boarding-houses, which have sprung up in the back streets, under the unnatural stimulus imparted by the Crystal Palace excitement of last year.

News Paragraphs.

☞ The Mt. Morris Union says:—Some time since we noticed the feat performed by Mr. G. Voorhies, of West Sparta, in carrying the mail, weighing forty pounds, on foot to Kysonville, a distance of seven miles, in one hour. We now learn that he is about to walk from Kysonville to Auburn, a distance of 76 miles, in one day, on a wager of $500—the feat to come off this month as soon as the preliminaries are settled.

☞ The Lords Commissioners of the British Admiralty have issued instructions that sailors, natives of Finland, taken prisoners of war by her Majesty's naval force, from on board Russian vessels, may be permitted to enter the British merchant service; they are, however, not to be allowed to join any vessel bound north of the British channel, or eastward of Gibraltar, in the Mediterranean.

☞ Seven persons in the employ of Mr. T. Gilliam, in Missouri, recently died of cholera within two or three days. They had been paid on Saturday for some extra work, and on Sunday indulged very freely in beer, ale, cider and cakes, and at night made a hearty supper on fresh fish. During the night and on Monday eleven were taken sick, of whom seven died.

☞ The four Irishmen who were indicted for murder at the Kane County (Ill.) Circuit Court, for the killing of Albert Story, an engineer at La Salle, last winter, had their second trial at Geneva last week. They were all convicted of murder and sentenced to be hung. There was great excitement during the trial, but the result seemed to give general satisfaction.

☞ The oldest man married in Massachusetts the past year, was 76 years. Two brides were 80 years each. The youngest girl who blushed and said *yes* to the question whether or not she would "have, honor and obey a husband," has seen the roses of only 14 summers bloom, while the youngest boy whose marriage is recorded in the table was 18.

☞ Information has been received by the Government, from Mr. J. Vallamit, of the discovery of immense deposits of guano on the Gallapagos Islands, off the coast of Ecuador. These islands are situated about half way between San Francisco and Cape Horn, and it is thought might be easily acquired by purchase.

☞ A house near Vicksburg, Miss., was struck by lightning on the 9th ult., and pretty much demolished. A loaded gun was fired off and broken to pieces, a keg of powder had two hoops knocked off it, but did not explode. Six persons were sleeping in the house, none of whom were injured by the stroke.

☞ The Mayville Sentinel learns that Grasshoppers are thus early making their appearance in many parts of the county. In some parts of the county last year they destroyed the crops of our farmers, and their early appearance, in large numbers, betokens the same calamity for the present season.

☞ The office of the Louisville Courier was destroyed by fire June the 5th. Loss about $7,000; covered by insurance. The presses, books and job office were saved. It was the work of an incendiary, and resulted in some way, probably, from the Courier's opposition to Man. Ward.

☞ It is said that the English government has made arrangements for withdrawing the regular troops from Upper and Lower Canada, with the exception of one regiment and a company of artillery for the garrison of Quebec, and the Canadian Rifle Corps for the occupation at Kingston.

☞ Mr. Van Huskirk, of North Adams, has been arrested on a requisition from the Governor of New York, on a charge of poisoning cattle at Hoosac; one of his brothers, with an accomplice, was arrested at Bennington, Vt., a few days since, for being concerned in the same deed.

☞ The soldiers of the War of 1812 are informed that arrangements have been made with the New York Central Railroad Company, by which all members of the Convention to be held in Syracuse on the 20th inst., will be passed over the road on their return home free of charge.

☞ During the six months ending January 31st, 1854, eleven emigrant ships were lost at sea, eight of them being bound to the United States or British America, and three of them to Australia. The total loss of life by these disasters was *eight hundred and forty-five*.

☞ The Hudson River Railroad Company made a trial last week, of running some of its engines with coke made from Cumberland coal, which proved very successful. The use of coke will effect a saving of two-thirds of the present expenses of working the engines.

☞ A letter from Leipsic states that the fair at that place is this year very badly attended, and little business is done. In other years there have always been a large number of purchasers from Turkey, Russia and Poland, but this year there are scarcely any.

☞ The government of Harvard College are said to be completely manifested by a recent bequest of $15,000, left by Miss Caroline Plummer, lately deceased, for the endowment of a new professorship on the "Philosophy of the Heart."

☞ Commissioner Wilcox, of Ohio, as is stated by the Cincinnati Enquirer, refused to act one day last week, when applied to by a gentleman from Kentucky, to issue papers to reclaim a slave, but shut up his office and fled from the place.

☞ Two emissaries of Kossuth were hung on the 29th ult., at a place called St. George, in Transylvania. Two of their companions were reprieved, but will have to endure an imprisonment for eighteen years in irons, and with hard labor.

☞ The Springfield Republican says, a gentleman in an adjoining town informs us there are two parties in that town on the Nebraska question. They are composed of the Postmaster on one side, and everybody else on the other.

☞ The result of the examination of the parties arrested in the fugitive slave riot at Boston, before the Police Court, is that Bishop, Stowel, Jackson and Morrison have been fully committed for the murder of Batchelder.

☞ Miss Melinda M. Ball, formerly a teacher in one of the public schools in Troy, has been discharged by the Board of Education, on the ground that she was a believer in the "spiritual rappings," and attended the "circles."

☞ The election of Directors for the Great Western Railroad was held at Hamilton on the 5th inst. Considerable excitement was prevalent, and Sir Allan McNab and two or three more of the old Board were ousted.

☞ Conrad, the candidate for Mayor of the Whigs, Natives and Know-nothings, and the whole Whig ticket, is elected in Philadelphia.

News Brevities.

—— Lord Elgin has left Washington for Montreal.

—— The King of Portugal is about to visit England.

—— Paris is being rapidly emptied of the *beau monde*.

—— Forty-five new planets have been discovered since 1608.

—— New Haven has chosen her charter officers, Whigs in the main.

—— The cholera exists to an alarming extent in various parts of Jamaica, W. I.

—— The British army consists at present of one hundred and forty-two thousand men.

—— The expense of the rendition of the fugitive Burns, is estimated at from $30,000 to $50,000.

—— A California paper says that the price of camphene is "eternal vigilance" and $3.50 per gallon.

—— Over three millions of dollars have been expended for the relief of the poor in Ireland the past year.

—— The cash receipts of the Erie Railroad for May will be about $350,000, the largest ever known in any month.

—— The Board of Education, of Syracuse, are discussing the question of reading the Bible in the Public Schools of that city.

—— A Cadet has just entered West Point from Tennessee, 6 feet 8 inches in height. He will do to lead the Grenadiers.

—— A Convention of the editors of the State of Maryland, was held at the Agricultural Rooms in Baltimore, on Friday week.

—— Mad dogs are plenty in Albany, and the Common Council have taken action against the canine race, with a view to their destruction.

—— The commencement at Bowdoin College this year, occurs on the first Wednesday in August, instead of September as heretofore.

—— There has been an exciting contest for Mayor at Washington. The anti-administration candidate, elected last year, is again successful.

—— The time for the acceptance of bids for the million State loan, in aid of the Canal Enlargement, has been postponed until the 22d inst.

—— Many of the heavy business men in New York are now closing their stores and manufactories in the city at 3 o'clock P. M. on Saturday.

—— A State Convention is to be held at Columbus, Ohio, on the 13th of July, of all opposed to the late aggressions of the slave power.

—— The amount of oil used by the Hudson River Railroad, for greasing axle-trees, &c., is so great that it takes $15,000 a year to pay for it.

—— The Cleveland Herald learns there are indications of more trouble at Erie in relation to the Railroads. There is again talk of tearing up the track.

—— The stockholders of the Utica and Binghamton Railroad, have voted to build the road on the canal route to Sherburne, and thence to Binghamton.

—— J. V. Himes, one of the chief leaders of the Second Adventists in 1843, has no confidence in the calculation that the end of the world is to come in 1854.

—— A woman with five small children undertook to ford a creek in Alanta, Ill., but her wagon was carried down stream, upset, and three of her children drowned.

—— The Detroit Advertiser states from a reliable source that five hundred pounds of silver were taken from the Minnesota mine on Lake Superior, a short time since.

—— The ship-keepers in Paris do not like the idea of closing their *boutiques* on Sunday, although the Archbishop is doing his best to bring them into the measure.

—— The Chicago Journal of Saturday week announces the arrival of twenty-five editors in that city, who were on their way to Rock Island and the Minnesota Territory.

—— The American Institute of Homœpathy met at the City Hall, Albany, on Wednesday of last week. A large number of physicians of that school were in attendance.

—— Since May the competition for passengers on the sailing of the California steamers has been so great, that lately through steerage tickets were sold for $25 and $30.

—— The first election under the new Charter, was held at Kingston, N. Y., on the 5th of June, and the ticket supported by the "Know-Nothings" elected by a large majority.

—— We can form some notion of where specie is tending, from the fact that already 225,000 sovereigns have been sent to the British army in Turkey, and $25,000 in silver.

—— A farmer named Cantin, near Quebec, was lately killed by a bear. The animal had attacked his cows, and his gun failing to dispatch him, the bear dispatched Cantin.

—— The Seminary at Charlottesville, Schoharie county, was destroyed by fire on Wednesday week, the result of no accident. It was under the patronage of the Methodist Conference.

—— The Republic says the Board of Trade of Buffalo have petitioned the Canal Board for a weigh-lock near that city, to enable them to take light weights when boats are discharged there.

—— The young Empress of Austria is very handsome, very accomplished, and quite a poetess. Her father was a clever man, but her uncle is the celebrated personage who was the protector of Lola Montez.

—— The Palmer Worm, a deadly foe to fruit trees, is making its re-appearance in Western Massachusetts, and fruit growers are obliged to destroy all infected trees, to prevent worms from reaching others.

—— In Newark, Ohio, a tavern keeper was bound over in the sum of $300 to answer at the Probate Court, on the complaint of a wife for selling liquor to her husband. This is the first case under the new law.

—— An expedient to procure Irish Catholics to vote at the municipal election in Philadelphia, was to print the name of the candidate for Mayor upon an American flag, with the liberty cap displaced by a Romish mitre.

—— During Holy week in Florence, Italy, boys were seen in the Jewish quarters making grating discords on a wooden instrument resembling an American horse fiddle, in token of resentment of the Messiah by their progenitors.

—— An Elephant escaped from a menagerie, between Providence and Fall River, on Monday, and attacked everything that came in his way. He killed three horses, destroyed wagons, and injured several persons before he was secured.

Literary Notices.

DATE LEAVES, OR HISTORICAL GAMES.—MRS. C. A. BREWSTER, Principal of Clover Street Seminary, and author of Bliss' Ancient History, Heroines of the Crusades, &c., has conferred benefit upon both the rising and risen generation by originating a series of Games which combine instruction and amusement. The Date Leaves consist of a set of sixty cards, comprising prominent historical facts and incidents, by which some fifteen or twenty interesting games may be played, each adding to the historical knowledge of the participants. "Each bears a date of the centuries from the Christian era back to the creation—a reference to the author where information in regard to it may be found, and a motto indicative of the moral of the story."

From the examination we have given these "Leaves," we are of opinion that Mrs. B. has furnished a valuable and entertaining substitute for games of less interest and questionable morality. The cards are published by WANZER, BEARDSLEY & Co., of this city, and such is their popularity, that several thousand packs of them have been ordered within a few days.

THE RAPPERS: or the Mysteries, Fallacies, and Absurdities of Spirit-Rapping, Table Tipping, and Entrancement.—Fully Searched after Truth. New York: H. LONG & BR. 1854.

Such is the title of a volume now lying upon a table which has never yet been "turned" by other than mortal power—and none of the accompaniments of the RURAL sanctum believe that such a well-carried and indispensable article of furniture could easily be moved by disembodied spirits. Of the merits of the work, we are not prepared to express an opinion—having scarcely read further than the title page. Those who have a fancy for this sort of reading will find the volume at DEWEY'S.

THE HISTORY OF GREECE, from the Earliest Times to the Roman Conquest. With Supplementary chapters on the history of Literature and Art.

THE above is the title of a re-print by the HARPERS, of a standard history of Ancient Greece by WILLIAM SMITH, L. L. D., editor of the "Dictionary of Roman Antiquities," &c., &c. It is the work of a master mind, one perfectly acquainted with the subject on which he treats, and the book is a classical work of great value. E. DARROW & BROTHER have it for sale.

Foreign Intelligence.

Arrival of the Arctic.

THE Arctic arrived at New York, June 7th. She brought dates to Sunday, the 28th ult., being eight days later than the advices by the Asia, and one day later than those by the Niagara at Halifax.

It is stated that the French army in Turkey will be augmented to 150,000 men. A protocol has been signed by the four powers asserting their determination to maintain the integrity of Turkey.

The Russians were endeavoring to cut off communication between Varna and Silistria—The combined fleets were still cruising before Sebastopol. The English division was to embark from Constantinople for Varna, while the French force was to march on the Balkans.

Arrival of the Pacific.

THE Collins U. S. mail steamship Pacific, with Liverpool dates to the 31st ult., arrived at New York June 11.

The Turks are still in possession of Silistria, from which place the Russians had been repulsed with severe loss.

The Journal de St. Petersburg says that on the 19th, ten frigates commanded the batteries at Witssbrug, and on the 20th approached Ekenas, but were repulsed. On the 17th, a squadron of two-deckers arrived off Taigo Head. A portion of the fleet bombarded Gustafshaven on the 22d.

Odessa, at last advices, was closely blockaded. No neutral vessels were allowed to pass through Odessa to the Black Sea, except laden with coal and naval stores.

The Turkish fleets were off Varna on the 11th of May, on their way to the Circassian coast.—On the 13th of May the Russians lost 1500 men in an attack on the new fort of Abdul Medjid.

The allied fleets were blockading Sebastopol.

The English mail at Marseilles brings the Russian treaty with the Affghans. Russia promises never, till the end of the world, to interfere in the interior concerns of the country; in return for which promise, the Khan of Khiva accords to Russia the right to build fortified harricades in the district of Bourgani. The stations named will be permanently occupied by Russian troops.

Dates from China to April 10th, state that on March 29th the Imperialists made an unsuccessful attempt to retake Shanghai.

The insurgents were steadily marching towards Pekin.

LIVERPOOL MARKETS.—Flour is quoted 2s. lower on the week. Wheat 1d. lower. Corn 1s@1s1d. lower. Market closed dull. Mellony quotes the stock of beef reduced. Pork dull. Bacon in large demand, but imports are excessive, and prevent any advance in value.

Arrival of the Arabia.

WE stop the press to announce the arrival of another Steamer, the Arabia, with still later dates from Europe. The dull aspect of the grain market has somewhat cleared away, and breadstuffs are reported again on the advance, and recovering from the previous depression. The belligerents are active, and, although no decisive or startling actions have taken place, the storm-cloud of war is gathering thicker and darker over the sky. Austria and Prussia seem, at length, to be moving in earnest, and in favor of the Western powers, so that Russia is likely to be left to struggle almost single-handed in the great European contest.

The Arabia arrived at New York, June 13th.

THE WAR.—Omer Pacha, after a conference with the allied generals, marched 90,000 men for Silistria. Austria has positively demanded the evacuation of the principalities.

The political intelligence generally is devoid of startling interest. Money continues tight, but there is no appearance of an advance in the rates. Weather is fine and prospect for harvest excellent.

It is reported on good authority at Vienna, that Austria has summoned Russia to evacuate the Turkish Provinces. When this is done, Congress may be ready to settle the conditions of peace.

On the frontier of Montenegro, 15,000 Turkish troops are encamped, and a considerable camp is also to be established in Albania. That mountainous country is completely blockaded towards the Provinces.

By the last accounts from the Black Sea, the fleet was still off Sevastopol. For several days there had been a heavy fog, and they had to keep up constant noises to prevent their running foul of each other. The cable which is put across the entrance of Sevastopol, is described as containing a number of chain cables twisted together, and secured on each side by strong masonry, and is held tight by capstans. From its being formed of separate chains, it would be sufficiently strong to keep out a steamer, or any vessel going at full speed.

LIVERPOOL MARKETS.—Flour has advanced 6d. Wheat is also advancing. Corn firm at previous rates. Tallow dull. Bacon advanced 1@2s, lard has advanced to 47s. Pork quiet.

California News.

Arrival of the George Law and Star of the West.

THE steamship George Law left Aspinwall at 9 o'clock on the morning of May 21, and arrived at Quarantine at 5 o'clock P. M., June 8.

She brought the California mails of May 16, $973,472 in treasure on freight, and 334 passengers.

The steamship Star of the West also arrived, in 7 days and 20 hours from San Juan del Norte, with passengers and California dates to May 16. She brings 513 passengers, $1,286,097 on freight, and $500,000 in the hands of passengers.

The Star of the West left San Juan on the evening of the 31st ult.

The city officers of San Juan have resigned, leaving the town without government, but no disturbances took place. There have been no outrages committed upon the Transit Company's property since the leaving of the Northern Light.

The Governor states in a message to the Legislature, that the public lands appropriated to educational purposes in California amount to more than seven and a half millions of acres.

The Filibuster Walker, and the remnant of his followers, had reached San Francisco to answer the charge of violating the neutrality laws.

The product of gold continues liberal. New and rich discoveries are frequent.

The farming prospects of the country attract more attention. The accounts look as though the State would soon grow its own food.

Commercial.

BUSINESS AND FINANCE.

Two California steamers, the Geo. Law and the Star of the West, have arrived during the week with $2,217,000 on freight, and a large amount also in the hands of passengers. The Liverpool steamer from Boston on the 11th took out $490,000 in gold; the Black Warrior for Havana on the 9th, had $14,000 specie, on freight, and the Collins steamer Baltic on Saturday took out $628,000, one-half of which was made up out of the last California arrival.

The public debt of the United States is now about $49,000,000 and slowly decreasing by the redemption of the outstanding stock. There are now locked up in the Treasury at our $30,000,000

The *Tribune* says that "the aggregate amount of foreign imports since Jan. 1, amounts to $79,493,973, against $81,653,083 same time last year. The Exports for the week amounted to $1,573,681, against $1,089,649 same time last year.

The amount received for tolls on all the New York State Canals during

The first week in June, was	$105,000 00
Same period in 1853,	31,010 26
Increase in 1854	$73,989 74

The aggregate amount received for tolls from the commencement of navigation to

The 7th of June, inclusive, was	$603,681 00
To same period in 1853,	614,671 01
For 33 days this year, less than for 49 days last	$65,010 01
Average per day in 1854	$18,010 00
Average per day in 1853,	13,760 76

Stocks have generally declined during the week. N. Y. Central now sells at 102¾. Mich. Central 100, &c., &c.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE, Rochester, June 15, 1854.

WHEAT and Flour show a weakened face this morning and seem to indicate that the high prices heretofore ruling in this branch of the produce market have reached a culminating point. Flour is quoted at $10,62½, which is a shilling lower on the barrel than the previous report. Wheat yet sells at nineteen shillings, although prices are tending downward.

Butter is a little firmer and brings 12½ to 14 cts. Eggs one shilling.

Hay plenty and going down, fifteen dollars being the highest paid to-day.

The Wool market opens low this spring. A few lots of the new clip have been brought in and sold for from 25 to 35 cents; wool dealers having been thus driven to badly sold last year that they are in no haste to run up prices above what the demands of the consumers will warrant. Farmers must not expect high prices for their wool this spring.

Rochester Wholesale Prices.

Marriages.

In Brighton, Tuesday morning, June 6, by Rev. G. W. Howard, J. T. BARNUM, of Walworth, and Miss JULIA A., only daughter of JOHN CULVER, Esq., of the former place.

Advertisements.

THE DATE LEAVES;

A HISTORICAL GAME OF FORFEITS, by C. A. BLOSS, Principal of Clover Street Seminary, Rochester, N. Y.; Author of Bliss' Ancient History; Heroines of the Crusades, &c.

Over Four Thousand Packs Sold in the First Ten Days.

The Date Leaves form a system of Social Games, intended for Parlor Amusements, Educational Inventions, or regular School Instruction.

It is believed that they possess all the *social qualities* of Gaming Cards, without that tendency to dissipation which makes card-playing so dangerous to young people. They place the company in pleasant sets, face to face; they inspire mirth, and furnish subjects for conversation; and these subjects are such as excite inquiry and promote research, and give systematic arrangement to the items of information which else uselessly lie in the memory.

No person can become acquainted with these Cards without gaining more historical information than he could by a year's reading, according to any method now before the public, and the *readiest* way to become acquainted with the Cards, is to *play* the games according to the directions which accom pany the Cards. Price 50 cents. Published by WANZER, BEARDSLEY & CO., Rochester, 232-4t ALDEN, BEARDSLEY & CO., Auburn.

NEW VOLUMES,

THE WATER-CURE JOURNAL, AND HERALD OF REFORMS.—Devoted to Physiology, Hydropathy, and the Laws of Life and Health. Illustrated with numerous engravings. Quarto. Published Monthly, at $1 a Year, in advance.

We know of no American periodical which presents a greater abundance of valuable information on all subjects relating to human progress and welfare.—*N. Y. Tribune.*

This is, unquestionably, the most popular Health Journal in the world.—*N. Y. Eve. Post.*

THE AMERICAN PHRENOLOGICAL JOURNAL.—A Repository of Science, Literature, and General Intelligence; devoted to Phrenology, Physiology, Education, Mechanism, Agriculture, and to all those Progressive measures which are calculated to Reform, Elevate, and Improve Mankind. Illustrated with numerous Engravings. Quarto, suitable for binding. 288 pp. Published monthly, at One Dollar a Year.

It may be termed the standard authority in all matters pertaining to Phrenology, while the beautiful typography of the Journal, and the superior character of the numerous illustrations, are not exceeded in any work with which we are acquainted.—*American Courier, Phila.*

Fowlers and Wells have all works on Physiology, Hydropathy, Phrenology, and the Natural Sciences generally. Booksellers supplied on the most liberal terms. Agents wanted in every State, County and Town. These works are universally popular, and thousands might be sold where they have never yet been introduced.

Letters and other communications should, in all cases, be post-paid, and directed to the publishers, as follows: FOWLERS and WELLS, 308 Broadway, New York. 2t

PURE SHORT-HORN CATTLE.

SIXTY HEAD—Female Calves, Heifers and Cows—descendants of Mr. George Vail's "Duke of Wellington," "Mercer," "Lord Burrington," "Fortuna," and "Beauclere." Also, "Prince of Wales," "Lord Marquis," "Sir Walter," "Monk," etc. All first class animals.

Address T. P. REMINGTON, 232-5t* No. 21 South Front-st. Philadelphia.

FARMERS' AGENCY.

BEING a Practical Farmer, and having considerable experience in the selection and use of Farm Implements, and living in the vicinity of extensive Seed and Implement Stores and Agricultural Implement Manufactories, and extensive Nurseries of the choicest fruit and ornamental trees and knowing the difficulties that farmers have to contend with in the selection of these in the busiest seasons of the year, I will select, purchase and carefully forward anything in the above line for a small compensation. Satisfactory reference given in all cases where required, and the money promptly returned in all cases where the wishes of the order cannot be complied with. 232-3m-tf

Address I. A. CLARK, Marion, Wayne Co., N. Y.

UNIVERSITY OF ROCHESTER

N. B.—Satisfactory reference given, and orders by mail promptly and confidentially treated. 232-1t*

M'CORMICK'S REAPING AND MOWING MACHINE.

IN THE GENESEE VALLEY, on the Great Farm of James S. Wadsworth, Esq., of Geneseo, and John R. Murray, Esq. of Mount Morris.

C. H. MCCORMICK, Esq.:—

Mr. Murray and myself purchased, last season, your combined REAPING AND MOWING MACHINES, either having tried one of Mr. Manny's, which proved an entire failure. I worked yours through the season; it operated to my entire satisfaction, and I think it superior to any other Machine in use in the country, both as a Reaper and as a mower. It has the advantage of a reel to bring in the grass & grain to the Sickle, enabling you to do work as well when the horses are moving at a brisk pace, as when driven fast, and requires less horse power than Hussey's, Burrall's, Ketchum's, and other machines that cut with knives and without reels, which have to be driven so fast to run the grain and get it upon the platform, as to greatly fatigue and worry the horses. The sickle cuts much easier than knives, and requires less attention and grinding to keep in order. I cut some 40 or 50 acres of grass with your machine, and it did its work quite as well as Ketchum's Mower. I found the reel a great advantage in mowing, and regard the machine in this respect superior to Ketchum's. In reaping it has the advantage over other machines, of a ride delivery of the Grain, placing it off of the way of the machine and horses upon the return, which enables you to cut when the grain is small to bind, and to cool-nur the work of the machine when you have no binders to keep up with it, and secure your harvest with but little trip.—I most cheerfully recommend the machine to farmers as one that can be relied upon to do their mowing and reaping right, having the advantage of economy in expense and storage, and doing its work as well as if in separate machines. F. YEOMANS.

Mt. Morris, May 25, 1854.

I concur entirely with Mr. Yeomans in the above statement. JOHN R. MURRAY.

Mr. Wadsworth, who is now in Europe, purchased last season one of the above described machines and was so well pleased with it both as a reaper and as a mower, that he proposed to Mr. Wm. McCormick, who was here to put up and start the machine, that he would write and cause to be published a notice of it in the Rural New-Yorker, and Genesee Farmer, recommending it to the Farmers of the country; but in the multiplicity of his engagements previous to getting off to Europe, doubtless forgot to do so. I am no agent for him and worked the machine on his large farm at Geneseo, and concur fully with Messrs. Murray and Yeomans in their opinion of the superiority of the machine. E. F. CURTISS.

Geneseo, N. Y., May 25, 1854.

Some defects in the machine of last year have been thoroughly remedied, and the machine for this year has been altered & improved, and will be warranted superior to anything of the kind, both as a reaper and mower. It will be found strong and durable—has a wrought iron beam which can be readily changed so as to cut any height of stubble, from one and a half to thirteen inches, by simply removing three bolts. This principle will be found wanting in other machines, though valuable upon rough ground and for cutting barley and lodged oats, and will enable you to clip the tops of seed clover and timothy, thus let it down, mow and save the hay. With the aid of the small wheel at the end of the beam the mower will cut 5½ to 8 feet in width easier than other machines 4½ feet. The mower has been used within a few days in New Jersey in clover with Ketchum's, and found fully equal to it, and the preference given to it. At a trial in Delaware it beat Allen's; Ketchum and Hussey declining to bring their machines to the test in consequence of the grass being wet.

Price of Reaper and Mower, with extra sickle, &c., $150. Reaper with wrought iron beam and extras, $135—Mower $130—subject to freight from Buffalo. Reaper of old pattern, $105 and $110. The machines will be forwarded to any part of New York or Canada, if ordered soon of THOS. J. PATERSON, General Agent, Rochester, N. Y. Office No. 6 Bank's Building.

C. H. MCCORMICK, Rochester, June 12, 1854. Per PATERSON.

FARM FOR SALE.

THE Subscriber having lately purchased a farm in the West, now offers his farm for sale, situated in Cato, Cayuga Co., N. Y., 1 mile from a plank road, 3 miles from a railroad, and 35½ miles from the flourishing village of Weedsport, (a first-rate market.) Said farm is second to none in the county, for richness of soil, is well watered, under a good state of cultivation, good fences and out-buildings, and a choice selection of fruit. The farm will be sold at a bargain, for one-half down, and the other half in four or five payments annually. If desired, about 45 acres, and will be sold with the crops on the ground if desired, and possession given at a short notice. If the purchaser wishes, he can have 20 acres formerly connected with said farm.

For particulars apply to or address subscriber on the premises. 232-1t GEO. S. WHITMAN, Cato, N. Y.

LETTERS PATENT FOR DESIGNS, &c.

PERSONS wishing to obtain U. S. Letters Patent for Designs, are respectfully informed that all the necessary drawings and papers are executed by the undersigned, at the *People's Patent Office*, 36 Nassau st., New York, with dispatch, on very moderate terms.

Under the laws of the United States, Patents are granted for ornamental works and decorations of every kind, such as the ornamental designs upon stoves, walls, ceilings, wood and metal carvings, busts, statues, compositions of all kinds in clay and bas or relievo, new forms of jewelry, watch cases, new designs for stamping on woolen, silk, cotton, or other fabric, or for any new impression, label, or ornament, to be placed on any article of manufacture, or any new and original shape or form of any article of manufacture. Such Patents secure to the Patentee the exclusive right to make and vend the same, for a period of seven years, the government fee being $15, gold.

The law for Designs requires the same process in soliciting, as for a mechanical invention, viz.: a model or specimen of the article, duplicate drawings, specifications, claims, &c. All the papers and drawings are executed by the undersigned. For further information, which can be had free of charge, apply to or address

ALFRED E. BEACH, Solicitor of American and Foreign Patents, People's Patent Office, 36 Nassau st., New York. 231-4t

BOOKS BY MAIL FREE OF POSTAGE.

UPON the receipt of the price of any work by mail, the work will be forwarded free of postage, to any address.

BOOK AGENTS WANTED!

To sell New Publications, Maps, &c., &c., to whom a liberal remuneration will be allowed. A small cash capital of $25 to $50 will be required, and the agent will be indemnified against loss on the stock. Address H. M. DEWEY, 231-3t Bookseller, Rochester, N. Y.

CHAIN HORSE-POWERS, THRESHERS, &C.

ENDLESS CHAIN HORSE POWERS, Threshers and Riddles, (lately improved,) made and sold by the subscribers, at Central Bridge, Schoharie Co., N. Y. Warranted to suit. Price, for two horse machines, $155.

Our 2 horse machines thrashed the wheat allotted it for trial, at the trial of Agricultural Implements, at Geneva, in July, 1852, in less time (and gave a better percentage of clean grain,) than any other machine on the ground, considering the amount of power applied.

230-3mow. G. WESTINGHOUSE & CO.

GLEN HAVEN,

THIS Water-Cure takes the first rank of establishments of this kind in the United States. During the past winter there have been from sixty-five to seventy persons in it taking Hydropathic treatment, and at the date of this advertisement there are not less than eighty who come from sixteen different States, and Canada.

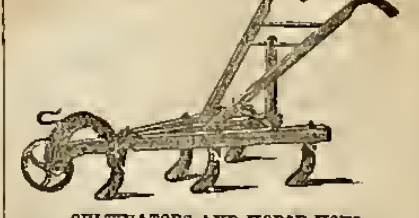
The Institution is not nearly full, and the proprietors take pleasure in stating that for beauty of location, salubrity of climate, purity of air, softness, purity and abundance of water, Glen Haven is without a rival.

The Physicians; Doctors J. C. & Mrs. L. E. Jackson, and Dr. Harriet N. Austin, are known wherever the Water Cure Journal is read.

Our route is from the east or west on the Central Railroad to the Junction; thence by omnibus to Skaneateles, and up the lake on the steamboat, or by James Tyler's livery. For further particulars apply for Circular. Address, Post-paid, J. C. JACKSON, M. D. 230-4t. Scott, Cortland Co., N. Y.

Valuable Farm for Sale, IN LOCKPORT, N. Y., on account of the proprietor's health. About 200 acres, with ample buildings, orchard, &c. Lying just outside the corporation line it offers an excellent investment, as the rapid growth of Lockport (present population 10,000,) constantly enhances its value. Will be sold together, or in parts, on easy terms. Inquire of E. B. GALUSHA, or O. C. & E. C. WRIGHT, Lockport. 230-4t*

Ketchum's Mowing Machine.—GEO. W. EMERY, 47 Liberty St., Albany, is Agent for the sale of this Machine for Albany and vicinity. Also Seymour & Morgan's New York Reaper. 230-4t



CULTIVATORS AND HORSE HOES.

WARNER'S double pointed polished steel Corn Cultivators, a large assortment, wholesale and retail.

Also, Horse Hoes, a superior article for cultivating corn, potatoes, &c., at the Old Agricultural Warehouse, Mumford St., near Gas Works. P. D. WRIGHT. Rochester, May 29, 1854. 230-3t

TENTS FOR AGRICULTURAL EXHIBITIONS, &c.

TACKLES AND STACK COVERS FOR FARMERS!

THE subscriber, who for many years has furnished *Tents* for the N. York, Pennsylvania, Wisconsin and other State Fairs, has on hand a great number of TENTS, suitable for Corn or State Agricultural Fairs, which he will SELL at a moderate price, or RENT, as may be desired.

Also, a large number of CAMP MEETING TENTS, of Duck, sufficiently light to resist water in the severest storms. All Tents intended for more than one family, will be furnished with canvas partitions, or partitions, and thin outside curtains are so arranged, that they may be raised so as to entirely exclude the night air. Also, HANDY TACKLE, for Farmers, a most useful article. For killing hogs, weighing hay, drawing logs and many other purposes, they are invaluable. Those having used them consider them almost indispensable. No. 1, fitted up with 40 feet of good rope, $3,75; No. 2, fitted up with 40 feet of good rope, $2,75.

Also, STACK COVERS, an excellent article for preserving Grain, &c., from rain. No farmer can afford to do without these covers, as often more than four times their cost is saved in one season.

☞ All orders, letters of inquiry, &c., (post-paid,) will receive prompt attention.

Address E. C. WILLIAMS, 220-4t No. 12 Buffalo st., Rochester, N. Y.

"HALTON" (11,552.)

My *first premium* Short-horn Bull, HALTON, will serve a few cows this season, at $10 each. Thorough bred Short-horn cows, $20 each; to be paid in advance. Cows not proving in calf, may be returned at any time within four months.

I shall have a few Short-horns for sale this summer, (male and female,) from premium animals. S. F. CHAPMAN. Mount Pleasant Farm, Clockville, Madison Co., N. Y. May, 1851. 220-4t-mow*

THE PEOPLE'S PATENT OFFICE.

THIS well known establishment is still carried on under the personal superintendence of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the oaths necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examination.

Private consultations held daily with Inventors from 9 A. M. to 5 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply in or address, post-paid, ALFRED E. BEACH, Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 36 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Address as above.

OSAGE ORANGE SEED.

—We will supply new crop Osage Orange Seed, at *Seventy-five* cents per quart, ready par ap, and with each package full directions for cultivation. Address orders to H. C WHITE & CO., Buffalo Agl Warehouse and Seed Store, Buffalo, N. Y. 223-tf

LAND PLASTER

At Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

217-4m. JIREH ROWLEY.

Poetical.

[For Moore's Rural New-Yorker.]

THE DEAD.

BY J. C. MILLER.

The earth is one great charnel house;
At every step we tread on graves—
Where battle plows with share of steel,
The blood-perfected harvest waves!

New life and bloom from old decay,
New form from olden chaos springs,
And all the glory of the past
The present bears on living wings.

The mellow pomp of Autumn woods,
The flaming red and pale gold,
Speak to the poet's gifted eye
Of fallen forests teeming mould.

E'en so are they who walk above
Sustained by those who sleep below,
For such the will of Him, who bade
The tide of being ebb and flow.

From life to death, from death to life,
From bloom to blight, from blight to bloom,
So throbs the tireless pulse of Fate,
And earth affords no quiet tomb.

Who sleep upon the mountain's top?
Who rest within the quiet vale?
Who lie in ocean's quarry caves
Far, far beneath the glancing sail?

None, none; for as the viewless winds
And flowing waters wander free,
The ashes of the dead are strewn—
The modest flower, the mighty tree,

All forms of animated life
Which walk the earth, or wing the air—
Go, view them all, and view them well,
The dead, the ancient dead, *are there!*

Rural Sketch Book.

MISS TODD, M. D.,

OR A DISEASE OF THE HEART.

FROM THE PORTFOLIO OF A YOUNG LAWYER.

The days of my clerkship were ended; my examination was over, I was admitted; wrote myself "Nehemiah Hubbs, Attorney," put up my new bright little sign, and in my native village began my professional career. No, I did not either; I am mistaken; I *intended* to pursue the honorable practice of the noble profession to which I had dedicated my talents and learning, in the place of my birth, but never was a truer word penned than the time, honored proverb, "A prophet has no honor in his own country." I believe if I had remained in the village of Green Briar till my head was white, they would have thought of me as nothing but a boy, and would have feared to trust me. Even after my sign was put up, nobody called me *Mr. Hubbs;* I was still "*Ne*" with old and young, and "*Ne*" I would have remained to this day, had I remained in Green Briar.

Only one case claimed my attention during the three months of my patient continuance in Green Briar, after being admitted to the bar, and that was the case of an unjustly impounded pig; "feloniously abstracted, your honor, from the small but secure spot in which my client had trustingly deposited him, and maliciously driven to the public enclosure called a pound, for the vile purpose, doubtless, of compelling my client in his poverty and destitution, to pay the enormous fee which has been demanded of him, in order to extricate the animal from his unpleasant position and restore him to the bosom of his family!

By this I meant the client's family, the pig having none of his own; it was a figure of speech undoubtedly, the family not inhabiting an Irish cabin, but still it rounded off the period, and sounded well to me, as I repeated over and over again my maiden speech, pacing up and down the floor of my little office. In this, my first case, I was successful so far as to rescue the impounded animal and save my client from the payment of an unjust demand; but it brought no silver to my pocket, neither, to my surprise, did it seem to bring honor to my name. The eloquence of my speech did not form the theme, as I fondly hoped it would, of paragraphs in the village papers, or of discussion at the corners of the streets, neither did it bring to my office the rush of clients for which each day I vainly made ready. It was plain that I should never rise to distinction in Green Briar, and so I came to the sudden determination to remove from that pleasant spot, and settle in some great city where nobody knew or had ever heard of me; where, above all, there was not a soul to call me "*Ne.*"

There I was more successful, and soon had the opportunity of forming a very advantageous partnership; business increased; money began to come in slow at first, but after a time more plentifully, and all things seemed prosperous in my outward circumstances. But alas! as we are so often told poetically, there is no sweet without its bitter, no rose without its thorn; and trouble came to me in the shape of disease, insidious, and slow in its approaches at first, long feared and suspected, but at length betraying itself so plainly, that I would blind myself no longer to the truth.

Yes! I was without doubt a victim of disease of the heart; not metaphorically, dear reader, for never had that organ beat with a quicker pulsation at the approach of mortal woman; so far as the gentler sex was concerned, I was a perfect stoic; but that there was *organic* disease about my heart, I could not doubt, and if ever the symptoms disclosed themselves unmistakably, they did so in my case. There was a fluttering, palpitation, irregular action, and at length pain; I could not work; life had lost its zest; the fear of sudden death was ever with me; I could enjoy nothing; if I had anything to leave, or anybody to leave it to, I should have made my will, for I was quite sure now that I should drop some day lifeless in the street, or that the morning would soon come, when the power to rise from my bed would have left me.

I remained at my boarding house, and found no comfort in anything but my cigar, and my dread disease grew worse and worse. As yet I had consulted no physician, partly, I think, from the apprehension of having my fears confirmed; but as I sat by my window one day, smoking as vigorously as ever, gazing abstractedly across the street, my attention was arrested by a modest little sign upon an opposite blind—"C. L. Todd, M. D." While thinking whether or not it would be best to make a trial of a physician's skill, a sudden tinge and flutter deceived me; yes, I would send for Dr. Todd, and know the worst at once!

Summoning the only male servant belonging to the establishment, I told him to step and ask Dr. Todd to come and see me as soon as possible.

The boy grinned.

"What are you laughing at?" I asked, "is not Dr. Todd a good physician?"

"Oh, yes sir," he answered, "I believe she is a very good physician, but she ha'nt never treated nobody here."

"*She!*" said I to myself, "the boy surely has Welch blood in his veins; they always *she* everything."

The boy soon returned, saying, "the Doctor wasn't home, sir, but I left your name on the slate."

In the course of the afternoon, as I lay upon the sofa, with my hand pressed upon my head, to still its irregular pulsations, there was a soft tap at my door. "Come in," I called out, and to my surprise, in came the neatest, brightest, most cheerful looking little woman it had ever been my lot to meet.

"You sent for me, I believe, sir?" she said, in a quick, brisk, pleasant way.

"I? No, madam; you are laboring under a mistake."

"Ah! I beg pardon," said the little woman, "I found on my slate the name of Mr. Hubbs, number fourteen, Mrs. Grey's boarding house, with a request that I would call and see him."

"Your slate, madame?" I exclaimed, my astonishment increasing every moment, "you surely are not a——"

"Physician! yes sir;" she interrupted quickly. "I'm a physician; Dr. Todd."

"Ex-traordinary!" was all I could say, for though I had heard at a distance of the existence of such beings, this was the first introduction to a female practitioner of the esculapian art. It was rather awkward, but since she had come, I determined to make the best of it, and acquaint the lady Doctor with my case.

She felt my pulse, asked numerous questions as to my symptoms, and then in her quick, bright way, exclaimed—

"Nervous! nervous! that's all, depend upon it! Excuse me, sir, but by the air of your room, I suppose you are much given to smoking."

I plead guilty.

"And how many cigars do you usually smoke in a day?"

I could not tell: I never counted; as soon as I threw away one, I took another, usually.

"Hum! a cigar in your mouth pretty much all the time, eh! Chew, too?"

Again a reluctant confession was wrung from me.

"I presume you sit up late, smoking all the time!"

"Yes, ma'am, smoking and reading."

"That's it! No disease of the heart at all, sir; nothing but tobacco; depend upon it;—nothing but tobacco; it'll make you fancy anything; it'll drive you crazy if you don't take care. Now will you promise to follow my advice closely, or not? If not, I will take my leave immediately."

I promised, submissive as a lamb.

"In the first place, then, throw away all your cigars and tobacco, and promise to buy no more."

With a sigh given to my sole consolations, I said I would do as she directed.

Many more directions she gave me as to diet, exercise, early hours, &c. Perhaps she saw too that cheerful companionship was one thing I needed, and so she remained awhile, talking with great glee and spirit, about matters and things in general; and promising to call and see me the next morning, she left.

I had not felt so well in a great while; indeed I had not given my heart a thought since the little woman entered the room.

The next morning I found myself watching impatiently for the arrival of my little doctor. She came, bright and cheerful as the day before. What a perfect little sunbeam she was! I could not help growing better under her care, and the influence of her cheering presence, and yet I managed to contrive some ache or pain every day, as an excuse for the continuance of her visits.

At length I found that my heart, which had long been quiet and apparently free from disease, began to flutter and palpitate again, but I observed it was only when I heard the little woman's tap at my door, or felt her soft fingers on my wrist. In short, as she had driven the disease out of my heart, that little woman herself had walked into it. I could no longer blind myself to the fact; and when she one day told me that I was now off the sick list, and out of her hands, I determined that she should not so easily get out of mine.

So I told her that as she had now given ease to my heart in one respect, she must not leave till she had done so in another, or I should be worse off than I was before. The little woman looked perplexed.

Then I stated my case, and explained my symptoms a second time, showing her the distressed state of my heart, and she alone could cure it. The former disease she had removed by an occasional visit; the latter could only be cured by her promising to come and take up her abode with me as *resident physician*. She understood me now, and by the way she pressed her hand on her own little fluttering heart, one would have thought the disease was contagious; and I verily think it was. So now we determined to cure each other, and next we are both to apply to a clergyman, who is to form between us a life-partnership, as lawyer and physician.

But one thing troubles me, of which I had not thought till now; that it is necessary to have our cards engraved. Married people are usually "Mr. and Mrs. so and so," or "Mr. such a one and lady," but will any one *please* to be so kind as to tell me how I and my little wife are to be designated. Will it be "Mr. and Dr. Hubbs," or "Mr. and Mrs. Hubbs, M. D.," or, as the ladies are going ahead so fast in these days of Women's Rights, will I sink into still lesser insignificance, and shall we be "Dr. Todd and *gentleman*," or must I drop the name of Hubbs altogether, and become a Todd, too? *Somebody* please tell me how to have those cards engraved!

THE QUAKER AND HIS APPRENTICE;

OR, THE BEAUTY OF DOING GOOD TO THOSE WHO DESPITEFULLY USE YOU.

It is now twenty years since we hung up on a peg in the old New Hampshire Statesman office, at Concord, N. H., a little brown jacket and blue cap, and commenced "learning the cases." We remember that cap and jacket well. It was the best cap we had then ever owned, and we remember that its visor had a green lining, which we fancied might be a great benefit to the eyes,—and we remember how our mother sat up for several nights, after the other members of the family were abed, to get that little brown suit ready by the day appointed for her boy to leave home and enter upon his seven years' apprenticeship. We were a little fellow then, (we are not very large now,) but we were so short then, that we had to endure the laughing of the big boys at our necessity of mounting a chair to get up at our work. But we have not set down to write about that cap or jacket, or the experience of those seven years, or to tell of the score of young men we met in that Printing Office—all now scattered; the major part already, have "passed that bourne whence no traveler returns." Peace to their ashes! But we want to tell of a couple of men, in those days, living in Concord, engaged in the book-binding business. Charles H—— was a man in idle life, a Quaker, and generally a very sensible and very clever man. But he was a man of intense and uncontrollable temper. When excited he wagged a saucy tongue—and sometimes dealt in blows. His best friends were not unfrequently the subjects of his violent abuse.—Oliver L. S—— was the other book-binder.—He was a young man, of not many words, but of attentive and industrious habits. For several years he had been an apprentice to the irascible Quaker—frequently subjected to his unreasonable rage, with scarcely a pretext for a cause, and was at last driven from his shop, his master emphasizing his imprecations by the flourishes of an iron press-bar.

Some sixteen or seventeen years since, the Quaker moved west. A few years later, the other binder removed to the city of Portland, where he has since been extensively and successfully engaged in book and newspaper publishing.

Day before yesterday we were in Portland, and in the counting-room of his newspaper establishment met with our old acquaintance again. The conversation of course turned upon olden times, and the gentleman gave us a bit of the history of his old master since his leaving Concord. He first pitched his tent at Utica, N. Y., where in a trade he fell into the hands of a rogue, and lost all his little property. With his interesting family, for he had a good wife and a fine troop of little ones, he pushed farther west. But misfortune kept in company, and he was reduced to extreme want.—Nine years ago, his old apprentice, at Portland, heard rumor of his circumstances, and that in his extremity he had been obliged to sell his shoes from his feet to purchase bread for his children. At once like a man with a heart beneath his jacket, he forgot all about their parting, and sent his old master *one hundred and fifty dollars*. It was the act of a Christian, (alas, that our world witnesses so few of the kind) and it was done in time, and it saved the man and his family. With an hundred dollars of the money the man made a purchase of a tract of rich prairie, twenty-five miles from Chicago. Not a board could be obtained nearer than Chicago—and they had not the means of buying, were lumber ever so plenty. The house consisted of a cooking stove sheltered by *three boards*. But they had the land, and kept their hearts, and bountiful crops followed their industry, and in a few years the $150, with many blessings, found its way back to Portland.

Last year the Portland man was traveling in the west, and finding himself within a hundred and fifty miles of the home he had enabled his old master to possess, he turned off from his journey to make the family a visit.—He says he found them on the most charming spot of earth he has yet seen. In the midst of one of the richest of the prairies, near a line of railway; with pleasant buildings, the sweep of wind broken by a growing forest of young locusts, that during the nine years had succeeded in developing trunks whose diameters were now six and eight inches. The buildings were a little distance from the highway, and the few acres intervening he found filled with all manner of fruit trees, pleasant shrubbery and beautiful flowers. Our friend tells us that as he rode up through these beautiful grounds towards the house, he discovered his old master sitting in his door. Dismounting, the two clasped hands, but the visitor, thinking that he was not recognized, said, "You do not know me." "Yes, I do. It is Oliver!" and the old man's gushing tears choked all further utterance. The wife heard the name, "Oliver," and she came out and the children, and not a word could any of them speak, but there upon the threshhold of the happy home, they all stood, shedding copious, gushing tears of joy and gratitude. What a happy meeting! And what a rich reward for that forgetting of past wrongs, and that act of kindness, which nine years before had laid the foundations of his happy and prosperous home! And what a happy world this might be, if we only had more good men in it!—*Eastern Journal.*

Youth's Corner.

ILLUSTRATED REBUS, NO. 26.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 24 letters.
My 16, 8, 12, 4, 5 should be on every farm.
My 9, 8, 12 every man should possess.
My 2, 5, 13, 4 is the name of a lake.
My 11, 17, 6, 9, 12 returns every 24 hours.
My 15, 4, 7, 5, 22, 2 is a Christian name.
My 4, 6, 22 is generally to be found in a barn.
My 8, 10, 21, 12 is a female relative.
My 1, 2, 22, 5, 21 are to be found in great abundance at the South.
My 12, 4, 8 is drank at almost every table.
My 9, 23, 20, 18, 17, 1, 15 sportsmen sometimes busy themselves about.
My 1, 4, 22, 8, 12, 17, 3, 2 is opposite of the affirmative.
My 14, 7, 5, 12, 19 is one of the points of compass.

My whole is an old maxim. N. D. D.
Eaton, N. Y., 1851.

Wit and Humor.

NONE OF YOUR BUSINESS.—An old maid, in a down eastern village, called, in her inquisitive way, upon a young and very pretty lady, a great favorite in the town, who (as she had "wormed out" of somebody with whom she had been tattling) was about to get married to a worthy young gentleman living in the same place. She began her questioning adroitly.

"I hear somebody's goin' to be married.—Who do you guess 'tis, now?"

"I don't know, I am sure."

"Could'nt you *guess*, now; don't you think of *somebody* that's going to be married?"

"I guess not."

"Well, now, Susan, s'posin' anybody was to ask me if *you* warn't engaged, and was going to be married 'fore long, what should I say to 'em?"

"Tell 'em," said Susan, "that you don't *know anything at all about it*, and that it is *none of your business.*'

The "business" of "pumping" was over for that day—in that quarter at least.

PHONOGRAPHIC.—Our S—— (dim) ought to go abroad and set up '*riting school.*' One day, Jim sent the teamster to O——, with an order for loading for his team, and directed him to return home the same day. The teamster was back in half the time allotted for the journey, and bolting into Jim's store, pushed the order in his face, and bawled out:

"What's *this?*"

S——: (Taking the order, and trying to read.) "What's *this?* Why, that's your *order.*" (Holding it toward the teamster.)

"Well, what on airth do'st *say?*"

S——: (Reads and spells, and studies, but 'tis 'no go.') 'Henry, (the clerk in the store,) what was't I sent for?'

Henry; 'why, you sent for salt.'

'Yes; there it is, as plain as day:' (spells,) 'C-o-l-t—salt.'

A LOVER once wrote to a lady who had rejected him, saying that he intended to "retire to some secluded spot and breathe away his life in sighs." To which the lady replied by inquiring whether they were to be *medium* or *large size?* The man has not since been heard from.

DR. FRANKLIN says that "time is money."—This may account for the fact that persons, when in most need of money, *ask for time.*

FOREDSH'S MOWING AND REAPING MACHINE.
Patented July 20, 1852.

THE AMERICAN MOWING AND REAPING MACHINE Co. have purchased the Patent Right for the above Machine for the United States, England and Canada, and are now manufactoring a large number to supply the demands of the coming season. The advantages which this machine possesses over all others are obvious, and will readily be acknowledged by all disinterested persons. Being a *combined machine*, and working equally well in grain or grass, it enables the farmer of moderate means to procure a valuable *Reaper and Mower* in one, which will do the work of both, and at less than half the usual cost. As a Mower it has no superior; it was thoroughly *tested* the past season in every variety of grass, and in many different sections of the country, and in every case where it was properly made, it gave perfect satisfaction. It will cut and spread from 10 to 15 acres of any kind of grass per day. As a Reaper it has never been excelled, and has no rival that can in all respects successfully compete with it. The patent for this machine covers many points of excellence which have heretofore been unknown, and which (of course) can be used in no other. In the construction and arrangement of these machines great pains have been taken to ensure the necessary strength, simplicity and durability. They are easily kept in order, and it requires but a few moments to change the machine from a Mower to a Reaper, and in either form it is equally strong and substantial. It is not liable to get out of order, and if any accident should happen it could be readily repaired by any ordinary mechanic. In the construction of the machines no expense has been spared to render them both perfect and durable. The Mower weighs but 731 lbs.—the Mower and Reaper combined 900 lbs. To any person desirous of purchasing, or of understanding the machine more fully, illustrated circulars will be sent with full descriptions, references, &c., &c.

Price of the Mower, ... $110 00
" " " and Reaper, ... 130 00

Terms—Cash in Buffalo. Delivered on boats or cars, free of charge.

Address orders or communications to the Company, or CHAS. W. SMITH, *Sec'y*, Buffalo, N. Y.

KETCHUM'S IMPROVED MOWING MACHINE,
WITH ENTIRE CHANGE OF GEAR, THE ONLY SUCCESSFUL MOWER NOW KNOWN.

Ketchum's *Improved* Machine, which we are building for the harvest of '54, was thoroughly tested last season, and the advantages gained by our change of Gear are in all respects as we designed, viz: *durability, convenience and ease of action.* The shafts now have bearings at both ends, which prevents all cramping and cutting away of boxing. A counter balance is attached to the crank shaft, which gives it a steady and uniform motion. Each Machine can be thrown out of gear; there is great convenience in getting at each and every nut, all of them being *on upper side of the frame;* oil cups are attached to all the bearings, which, by the use of a wad of cotton, will hold oil for a long time, as well as protect the bearings from dust, grit, &c.; the finger bar is lined with iron its whole width, which protects it from wear.

These and various other additions for strength, durability, &c., makes them the most simple and perfect agricultural implement in use. They weigh about 750 lbs. each, and can easily be carried in a one-horse wagon.

It requires not over ten minutes to get one ready for operation, there being but two bolts, (besides the pole bolts,) to be secured to have one ready for use. They will cut *all kinds of grass*, and operate well on uneven or rolling lands, or where there are dead furrows. This Machine took the highest award, with special approbation, at the World's Fair; it also received, during last season, one silver and four gold medals, and various other flattering and substantial testimonials of approval. We have spared neither pains nor money to make this machine deserving of public favor, and hope to be able the coming season to supply the great and increasing demand.

We take this occasion to caution farmers against buying *untried* Mowers; if they do (as was the case with many last year) they will incur loss, vexation and disappointment.

If any parts are wanted to repair any machine we have sold, or may hereafter sell, they will be furnished and only manufacturers' cost for the same be charged.

☞ In all cases where extras are wanted, be sure to give us *the number of your Machine.*

(WARRANTY:) That said machines are capable of cutting and spreading, with one span of horses and driver, from ten to fifteen acres per day of *any kind of grass*, and do it as well as is done with a scythe by the best of mowers.

The price of the Mower, with two sets of knives and extras, is $110 cash, in Buffalo, delivered on board of boat or cars free of charge.

Office and Shop, corner of Chicago street and Hamburgh Canal, near the Eastern R. R. Depot, Buffalo, N. Y.
HOWARD & Co., Manufacturers and Proprietors.

The Mower is also manufactured by RHODES, NOURSE, MASON & Co., at Worcester, Mass., for the New England States.

By SEYMOUR, MORGAN & Co., Brockport, N. Y., for Illinois, Iowa and Michigan.

By WARDER & BROKAW, Springfield, O., for Ohio and Kentucky. 220-4t.

J. RAPALJE & Co. are also sole Agents for the sale of Ketchum's Mowing Machine in Rochester, and for the vicinity. 220-1jy m31-3t

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

EMERY'S HORSE POWERS, Threshing Machines and Separators, Circular and Crescent Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use.—Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—GRASS, FIELD AND GARDEN SEEDS, of the best Imported and Shaker growth.

IMPORTED HORSE "CONSTERNATION."

THIS well known thorough-bred horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of YOUATT.

TERMS—$10 the season, $15 to insure, *payable in advance in all cases.* Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No mare will be served that is either ring-boned, spavined, or blind. J. B. BURNET.
Syracuse, N. Y., May 1, 1854. 220-8tw-3tm

MOORE'S RURAL NEW-YORKER,
IS PUBLISHED EVERY SATURDAY,
BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

Moore's Rural New-Yorker:
A QUARTO WEEKLY
Agricultural, Literary, and Family Newspaper
CONDUCTED BY D. D. T. MOORE,
ASSISTED BY
JOSEPH HARRIS, in the Practical Department: EDWARD WEBSTER, in the Literary and News Dep'ts.
Corresponding Editors:
J. H. Bixby,—H. C. White,—T. E. Wetmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the Important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete Agricultural, Literary and Family Newspaper.

☞ For Terms, &c., see last page. ☜

Rural New-Yorker.

Progress and Improvement.

HAYING AND HARVESTING.

Haying and Harvesting are the two grand events in the Summer Campaign of farmers in all grazing and grain growing regions. They are the principal items of labor for the ensuing six weeks or two months, among the great majority of our subscribers, East and West, North and South. In some sections where the Rural circulates, both these important and laborious operations are at hand—though our readers in New England, New York, the Western States, and Canada, have yet time for ample preparation, especially for wheat harvesting. Hence a few remarks on the subject will be seasonable, and perhaps embody suggestions worthy of attention.

It is of the first importance to be fully prepared, *in season*, for both haying and harvesting. Usually the greatest inconvenience experienced by farmers consists in the lack of sufficient and *efficient* help. An extra number of laborers is necessary, and unless their services are engaged early, loss is often sustained by not securing the grass and grain in proper season. And those who wait until the last moment, are necessarily obliged to accept such laborers as are obtainable, however inexperienced, and not unfrequently pay exorbitant wages. Farmers who require special assistance should see that it is secured without delay, and those who attend to the matter now can engage the most capable hands.

But hundreds if not thousands of our readers cannot accomplish their haying and harvesting in proper season, without the aid of machinery. Mowing and reaping machines must, to a great extent, take the place—or supply the want—of laborers. Those who require the aid of machinery should lose no time in securing it early, so that there shall be no failure when wanted. There is nothing like being fully "up to time" in beginning to cut grass and grain, and every farmer should make ample and timely preparations to secure his more important and profitable crops at the most favorable period.—Those who have the necessary machines and implements, should see that they are in proper order,—and those who need new ones should lose no time in securing the best obtainable.—We say *the best*, because a poor implement or machine—a one-horse affair, liable to "fail to connect" when most wanted—is generally a losing investment. Farmers who count their acres of grass and grain by twenties, fifties and hundreds, can not only afford to own and use the most improved labor-saving machinery, but will find it nearly indispensable. In many instances, two, three or more farmers can advantageously unite in the purchase and use of mowers, reapers, horse-rakes, threshers, &c.

As to the precise time of cutting grass and grain, there are various opinions, though it is now generally conceded that both should be cut before fully ripe. Meadow hay intended for winter feeding should never be allowed to stand until nearly matured. Many of our best farmers cut their grass when in blossom, or soon after that time. By cutting during the period of inflorescence, and curing properly—using from one to two pecks of salt per ton, according to the use to which the hay is to be applied—excellent winter food for stock will be secured.

The advantage of cutting wheat early—from one to two weeks before fully ripe—has been argued and demonstrated in previous volumes of the Rural, and is now so generally conceded that we need not recapitulate testimony in this connection. The results of carefully conducted experiments, conclusively proving the great advantage of cutting while the berry is soft, have been published and re-published throughout the land,—and yet hundreds of farmers annually allow their wheat to stand till nearly "dead ripe," and then raise a tempest because help is so scarce, and their crops about to be half wasted or ruined! Of course none of our subscribers belong to this class—though it is possible that some of our *occasional* readers may,—for people who neglect to subscribe for the Rural would be very likely to procrastinate in other important matters!

—In conclusion, every farmer will be the gainer by arming and equipping for the campaign at the earliest practicable moment. See that you have the proper tools, in good order, and the right men to handle them. Let this be done beforehand, and it will save a vast deal of vexation, to say nothing of pecuniary gain—which latter ought to have some weight, even in these prosperous times for farmers.

CULTIVATION OF TURNIPS, RUTA BAGAS, &c.

The cultivation of Turnips has been advocated by nearly all agricultural writers in this country; but it cannot be denied that at the present moment Turnips are held in as light estimation by practical farmers, as they were half a century ago. We have been told of their immense value in an English system of rotation, and many able theoretical arguments have been adduced to show that the acreage yield of the cereal crops on a farm is in proportion to the quantity of roots produced; and this, to a certain extent, is undoubtedly true. We have, ourselves, earnestly advocated an increased cultivation of Turnips; knowing that if they could be grown, and fed to stock, the fertility of the farm would be greatly increased But the fact that many of our best and most intelligent practical agriculturists, (American, Scotch, and English,) after repeated trials, have given them up, causes us somewhat to doubt whether Turnips or Ruta Bagas will ever be extensively cultivated in this country. Good crops of Ruta Bagas and Turnips have been raised, however, and there are those who assert that our climate is as well suited to their growth as that of the British Isles. The advantages to be derived from a good supply of roots are so great and numerous, that we should not give up their cultivation without abundant proof that they cannot profitably be grown.

The first requisites in growing Turnips are, good clean land, and as our English correspondent termed it, *"flour-like tilth of the soil."* They should be sown in rows, say 2½ feet apart, and be thinned out in the rows from 12 to 14 inches. This is very important. Could a good superphosphate be obtained at a fair price, say $30 per ton, we are persuaded, that *drilled with the seed*, it could be used with great profit for these crops; sown broadcast, we should prefer Peruvian guano, especially for Ruta Bogas. In England, Ruta Bagas are sown in April and May, common Turnips in May, June and July; here, the former should be sown the latter part of June, and the latter in July, or even in August or September. It is best to put on plenty of seed, say two pounds per acre, in order to prevent, as much as possible, injury from the fly. The *Skirving's* Ruta Baga, though they contain more water than any other variety, are, from their rapid growth, perhaps the best that can be sown.

Mangel Wurzels are better adapted to this climate than Ruta Bagas or Turnips, while they are much more nutritious, produce more to the acre, and are not injured by insects; *but they require very rich land.* They should be sown earlier than Ruta Bagas. Soaking the seed for 48 hours in tepid water is very beneficial, and when sown late, should not be neglected. We repeat, clean culture, fine tilth and repeated hoeing, constitute the three great elements of success in root culture.

GRASS HEADLANDS.

In a late number of the Rural, H. D. L. S., of Pompey, advocates grass headlands of at least a rod broad. You solicit the views of correspondents on this point. Some advantages would doubtless be realized from the "course described," but too slight, I think, to counterbalance the drawbacks. Adopt this course, and a field containing ten acres, with equal sides, would have 156 rods of border—a fraction less than one acre, or one-tenth of the whole field. If your field is a parallelogram, the proportion of border will be greater. A square gives the least possible amount of border. Ten acres, in a farm of one hundred, appropriated to headlands! Too much, is it not?

Line fences are necessarily stationary. In farms of tolerably even surface, I do not think stationary division fences desirable. A tier of fields fronting on a road or lane, can undergo occasional changes to advantage. For this purpose, where rail timber is abundant, I prefer for inside fences, rails to posts and boards. As often as from five to eight years, these division fences should be taken up, and reset in a new place, so as to make the headlands between two fields the centre of a newly-formed field. The old headlands can then be broken up, made clean and cropped. These changes will obviate the danger of "grain growing too rank to fill well, or lodge or rust, on account of the richness of the border." Borders will naturally become the richest part of the field.—They are not exhausted by cropping. Cattle and sheep seek them as a shade from the sun, or a shelter from storm and wind. Of course their ordure enriches these places of resort. The burdock, the thistle, the elder, and kindred nuisances, luxuriate in such localities too often with impunity. All these furnish reasons in favor of the course I suggest. Other reasons will readily present themselves to the mind of the practical farmer, of which, having appropriated my full share of space, I cannot now speak.

P. Keat.

Webster, N. Y., May, 1854.

BUCKWHEAT TO KILL QUACK GRASS.

Eds. Rural:—I have read with considerable attention, your correspondents' articles on the subject of exterminating quack, and think they are very good; but think that we have a way here in old Herkimer, that is better than underdraining, or summer fallowing. Underdraining of itself, will not kill the quack; but summer fallowing will, if it is well attended to. The way we take to exterminate it, is simply to "choke it out," by sowing a grain that has a rapid growth, and which covers the ground so completely as to give the quack no chance for "breathing." This grain is Buckwheat.

The mode of procedure is, to plow the ground in the fall, and again in the spring; then harrow the ground two or three times, at intervals of two weeks, or oftener if the quack grows very fast; (be sure to keep the quack down, so that the blades get no more than three or four inches long.) Sow between the twelfth of June and the first of July. Use half a bushel of seed more per acre than is usually sown. If the ground is not strong enough to bring a heavy growth of straw, use manure freely,—as the object is to promote a heavy growth of straw, that will effectually smother any plant that is under it.

The advantage this method has over that of summer fallowing is, that summer fallowing only kills what quack is brought on top of the ground by the plow and harrow: the rest is left free to sprout and grow again, and as long as it has a chance to sprout, it will retain life. Buckwheat kills it by stopping its lungs (leaves,) and the next year, the ground when turned over will have the appearance of a half-decayed straw-stack, thereby giving it an excellent coat of manure.

J. A. W.

Mohawk, June, 1854.

Good Milking Breeds are distinguished by a soft and supple skin, and by tissues rather relaxed than rigid; are not hardy, or fit to bear fatigue, (sweating easily, and falling rapidly off when put to work;) are difficult to keep, seldom fat, and have often little flesh on the buttocks.

MR. MAPES,—ONCE MORE.

In the Rural of May 6th, we gave a short review of our controversy with Mr. Mapes respecting "Mapes' Improved Superphosphate of Lime," and an account of a recent visit to his factory undertaken in self-justification, Mr. Mapes having most solemnly charged us with gross and wilful misrepresentation. We clearly showed that Mr. Mapes had taken the affidavits of his men to a statement drawn up by himself, and which, though true, perhaps, at the time it was sworn to by the men, was utterly false as applied by Mr. Mapes for the purpose of throwing doubt on our statement as to the mode of manufacture practiced at the time of our first visit to the factory, he having altered his process of manufacture in the interval. To the serious charge we were thus compelled to make, Mr. Mapes replies in the June number of his *Working Farmer*, as follows:

"J. Harris.—We are more than surprised at finding the columns of the *Rural New-Yorker* again disgraced by a continued rhapsody of misstatements from this desperate adventurer.

He now asserts that in disguise he has visited the factory where the improved superphosphate of lime is made, and discovered that the affidavit of twenty men, published by us in our March number, and which clearly established that he, Harris, was an unmitigated, wholesale manufacturer of falsehood, was sworn to by the parties without understanding it, &c. He next proceeds to detail a new set of fictions, as untrue as those answered by the first affidavit.—Had these assertions not appeared in a paper previously respectable, we should not notice them, nor are we willing further to annoy our readers by using the columns of our paper in replying; we shall, therefore, at an early date, publish a supplement, in which Mr. Harris will find a new affidavit from the same parties, which may possibly give him occasion for a new disguise. In the same supplement we shall notice the vile attack by Dr. Lee, and a few others who seem to have thought that personal attacks on the Editor might do away with the increasing influence of the *Working Farmer*."

The defence are offered, he tells his readers, was, that the twenty men had sworn to the affidavit without understanding it. Now, we believe that most of the men—many of them Germans that cannot speak a word of English—did not understand the affidavit, inasmuch as, while it made them swear that they believed Harris never visited the factory, they told us that they knew he did, in company with Mr. Warn; they also said that they thought Harris had declared that the superphosphate was made from unground bones—"shank bones"—while our assertion was, that it was made from *unground* animal charcoal. But this was not our reply; it was that Mapes had altered his process of manufacture between the period of our visit and the time of swearing the men. Of this serious charge, it will be seen, he takes no notice. But he threatens us with a supplement, and a new affidavit, &c.—This is a favorite dodge with the Professor. In his December number, in reply to articles from a number of papers, instead of attempting the refutation of the charges brought against him, he says:—"We shall shortly publish, in pamphlet form, the certificates of those who have used it, [the improved superphosphate,] as to its practical effects, which will *forever* put at rest the illiberal doubts and mis-statements trumpeted before the readers of the *Country Gentleman*, *Albany Cultivator*, *Genesee Farmer*, and the few other papers who have copied them."

We have waited six months for this pamphlet, but have not yet seen or heard anything of it. Would it not be well to give it in connection with the forthcoming supplement? We do sincerely hope that it will be published at an "early date," as we are very curious to see how an affidavit can be drawn up that shall in any way successfully meet the charges brought against Mr. Mapes' veracity. It is easy to *call* us "a desperate adventurer," an "unmitigated wholesale manufacturer of falsehood," &c., but this does not annoy us. It is what we expect from any unprincipled manufacturer, against whose commodity we have felt it a duty to caution the public.

Mr. Mapes has unusual advantages for driving his business. He goes to the New York Farmers' Club, puffs his manure, and gets it inserted in the *Tribune*, the *Banner of Industry*, and other papers. He is also Editor of the *Working Farmer*, *Practical Farmer*, and *Journal of Agriculture*. He has, therefore, rare chances to puff his improved manure, seeds, plants, plows, &c. The community, thanks to the Agricultural Press, are now beginning to understand some of his tricks, and he is obliged to be a little more cautious; but even now he makes good use of his opportunities. Let us take the *Working Farmer* for the present month, and in the first article on Dwarf Pears, he says:—"When treated with the improved superphosphate of lime, they may be cheaply and profitably raised." Not otherwise, of course. In the second article on Grape-vines, he says:—"They should receive a weak solution of improved superphosphate of lime." In the third article, he says:—"A still better article for this second manuring, or top dressing, [for corn or potatoes,] is the improved superphosphate of lime." Again:—"It will be found more economical than guano, and more lasting in its effects." In the next article, on the "Care of Implements in Summer," he says nothing of the improved superphosphate. We are somewhat surprised at this. Why did he not recommend the "improved" as an invaluable antiseptic paint?—The next article is about a wonderful kind of Rhubarb which Mr. Mapes has had for three years. Will the Professor tell us what he sells the roots for? The next article says:—"The improved superphosphate of lime, and many other manures, are not volatile, but slowly soluble, and thus may be applied without additions," &c. Then follow extracts from foreign papers, &c., most of which smack of superphosphate. Farther on, he says:—"We have just received from the northern part of Germany, a *large invoice* of four new kinds of grapes, which we shall be ready to furnish to growers in the autumn at *moderate prices*."—Farther on he copies an article on the value of bones, and adds:—"The above from the *Horticulturist*, has been fully sustained by the effects produced on grape-vines from the use of the improved superphosphate of lime." Thus, out of twelve editorial articles in the June number of his paper, we get six puffs for the improved superphosphate, and one or two for other wares he has for sale. Indeed, he appears to publish the paper simply for this purpose. At all events, he is exceedingly careful that nothing shall get into it that at all disparages the use of the "improved," while everything that is at all favorable is instantly copied. Thus, in the Rural of January 14, we published some experiments with superphosphate of lime on tobacco, from R. Linsley, Esq., of New York. In the March number of the *Working Farmer*, Mr. Mapes refers to it, and says:

"In another article, Mr. Harris speaks highly of the effects of superphosphate of lime on tobacco, and refers to his having recommended its use for such purpose, in his paper in the State Report. If he will inquire of the party who used it so successfully, he will find it was the improved superphosphate of lime, and not, as he supposes, the superphosphate of lime used in that case. We know all about it, and unless he is careful, he may again recommend our article by mistake."

The following letter from Mr. Linsley will show that, though Mr. Mapes did "know all about it," he nevertheless misrepresented the matter, and embraced the opportunity to give his improved superphosphate another puff:

New York, March 30, 1854.

J. Harris, Esq.: Dear Sir—I noticed in the last *Working Farmer*, the allusion to the experiment made on tobacco with superphosphate of lime, intimating that it was made with the "improved superphosphate of lime" manufactured by Professor Mapes, and that he "knows all about it." I will only say that Mr. McCready, Mapes' agent and publisher of the *Working Farmer*, called on me, and inquired if it was made with Mapes' improved superphosphate of lime that I purchased of him. *I told him distinctly that it was not;* but gave him no further information; and he could have known nothing more about it than what was conveyed in the article in the Rural. This conversation was

immediately after the article appeared in the RURAL, *and in time to have the Working Farmer entirely correct.* The experiment on tobacco was made with Coe's superphosphate, made at Middletown, Conn., and according to my experiments, is very much better than MAPES' "improved." I have tried both on nearly all crops, except tobacco, side by side. Yours, very truly,

R. LINSLEY.

MAPES' assertion that the experiment was made with his manure, and that he knew "all about it," taken in connection with Mr. LINSLEY's letter, will afford some insight into the Professor's love of truth. As will be seen, we have had this letter on hand several months, waiting to see if MAPES would correct his misstatements; but he has not done so. We have abundance of such matter on hand. We are continually receiving letters complaining of the Professor's misdoings. One gentleman, in whose veracity we place implicit confidence, writes, that "at the auction of E. J. TWINS & Co., Seedsmen, Chambers street, New York, MAPES attended, and bought up very large quantities of the seeds, and also a large lot which came from COMSTOCK, FERRE & Co., Weathersfield, Conn. Immediately afterward, he opened a seed-store in Fulton street, and advertised very valuable seeds for sale, raised by Professor J. J. MAPES, Editor of the *Working Farmer*, &c.—selling them at high prices, as a very superior article."

Perhaps Mr. MAPES may condescend to tell us something about this transaction in the promised "supplement."

And we would propound another question to be answered at the same time. Mr. MAPES declares that he puts to every 100 lbs. "fire-dried bones," 36 lbs. Peruvian guano and 20 lbs. sulphate of ammonia. During our late visit to his factory, we saw many tons of charcoal mixed with sulphuric acid, and several tons of this acid and charcoal mixture, mixed with the guano, ground and put into bags, with Mr. MAPES' certificate. The proportion of guano used was 12 level half-bushels, to 13 heaped harrow-fulls of the charcoal and acid. The harrow held three bushels. From a number of weighings, we know that the acid and charcoal mixture weighs 78½ lbs. per bushel, while guano weighs 52 lbs. per bushel. This would give about 10 lbs. of guano in each 100 lbs. "improved superphosphate of lime." But what of the sulphate of ammonia? We watched very carefully, but *we saw none put* in, and could discover none on the premises. Taking the improved to contain 10 per cent. guano, it would contain 1-6 per cent. of ammonia, corresponding closely with what Mr. JOHNSON found in the sample he analyzed. J. H.

A NEW FENCE.

A CORRESPONDENT of the *Michigan Farmer* gives a mode of building a board fence that obviates the necessity of setting the posts in the ground. Where timber of suitable durability for setting is scarce, this plan may be economical; as any kind of timber will answer for the posts, which may be much smaller in size than when intended to be put in the ground. With some, the objection might be made against the fence occupying more ground than the common board fence, as this is worked like a common rail fence. Yet there is this advantage, the fence can be made more substantial against winds and other accidents.—But to the plan, of whose utility our readers can judge for themselves.

Take narrow boards, say five inches wide, and an inch and a half thick,—we suppose inch boards would suffice, but the thicker make the stronger fence,—and twelve feet long; use six boards to each length, leaving the proper spaces between the boards, so that the fence shall be at least four feet in height if set on the ground. Posts of hard wood durable above ground, are preferable—two of which are used to one length. Three by four scantling will suffice for size; cut the posts long enough to project two inches below and three inches above the bottom and top boards of the fence. To make the fence maintain its position, it must be worked more or less, say four and a half feet when two lengths of twelve feet will reach twenty-two feet.

To prevent the fence swaying lengthwise of the panel, it is better to mortice the middle post, and pass the boards through it with a wedge driven tight over each board—the mortice being wide enough for the purpose. Or a gain may be sawed in the edge of the post for each board when they are to be spiked on.—For the end posts, cut a gain in the outer corners, in such a shape that when the board is nailed to its place, the uncut four inch side will be parallel to the line of the next length, to which it should be nailed. In this manner, one set of boards will be on each side of the corner posts. The ends of these boards may be reduced in thickness, when double ten-penny nails may be taken and annealed; these may be driven from the flat side of the board through the post and both boards, and clinched, thus serving the purpose of both nailing the boards and doubly strengthening the fence. The posts should be raised from the ground on flat stones or blocks, where they will be just as durable as any part of the fence. But a small amount of material is required, and the openness of the fence will, in a stony country, obviate much of the tendency of drifts in a winter season. T. E. W.

UNRIPE SEED.

M. DUCHARTRE, Professor of Botany in the Royal Agricultural College, Versailles, has made a series of experiments with a view of testing the power of seeds to germinate and grow, when gathered before their period of full maturation. The Farmers' Companion translates some portion of the Professor's article on the subject. The experiments were carefully conducted and with several varieties of wheat, rye and barley. The conclusions arrived at from the experiments were that the seeds of our cereals would germinate and grow a long time—from 20 to 25 days—before their maturity; while the embryo is yet very imperfect and the albumen still almost in its milk. Barley, however, seemed to be limited to 15 days, and appeared to be more difficult in germinating. Others, the seeds of which did not reach their maturity, germinated more easily than those perfectly ripe. Plants grown from the unripe seed dried, were all remarkable for their vigor and luxuriance. If the offspring of the seeds sown unripe and *green*, were at first visibly weak, they rapidly gained strength, and then their growth was very beautiful. There was no difference perceptible between the plants grown from seeds in different stages of approach to maturity or ripened; or if any, it was in favor of the plants from the *most unripe seed*." To those of our readers who have the time and inclination to make similar experiments, carefully in a small way, it would be interesting, while it would aid in throwing light upon the vitality of seeds, that might be of practical benefit to agriculturists. T. E. W.

QUACK GRASS, ALIAS CHESS GRASS.

ENS. RURAL:—If your space and patience are not already exhausted, and seeing that my former article preceded our friend JOHNSON's, (whether or not his was written with reference to it I cannot say,) I should be glad to offer a few words more.

I know a kind of grass which I have heard denominated quack grass, which grows only in low ground, but I cannot suppose this to be the grass in question, for it is not a long-rooted grass, neither is it difficult of extermination. The grass which has caused me trouble, I have preferred to call *chess grass*, because there is some resemblance between it and chess, and also because *quack* is a general name, equally applicable to other noxious grasses.

Now, as to the underdraining idea, I have this to say:—I had a field of five acres, a little more than half of which was considerably overrun with this grass, but by plowing and cultivating during the hottest weather, I subdued it. The center of this field rises from the sides at an angle of 20° or 30°, and is probably as high land as there is in this town, and is already too dry without underdraining; and yet this grass has luxuriated on the top and southern slope of the hill. There is not a moist spot on the hill, nor any evidence whatever of stagnant water; indeed, it is *too dry*. I found a little of this grass in swale, which I underdrained, but it grew nothing like as thrifty as that on the upland. W. B.

West Bloomfield, N. Y., June 13, 1854.

DO SWALLOWS KILL BEES?—I noticed an article in the RURAL from D. N. GLASS, stating that swallows would kill bees. This is undoubtedly so; they will kill the drones, which are about twice the size of the workers, and have no stinger, but *they will not kill the workers*, as the stinger, in my opinion, would cause death. The drones leave the hive from 12 till 3 o'clock, at which time you will see the swallows selecting out their game. Swallows never meddle with bees until the drones make their appearance, which is about the first of June; they are the worst in July. I have kept bees for ten years, and believe swallows to be a benefit to bees rather than an injury.—GEO. SWIFT, *Clarkson, N. Y.*

PUBLIC BENEFACTOR.—He is a public benefactor who, by the prudent and skillful outlay of his money in bettering its condition, shall make a single field yield permanently a crop; and he who does this over a square mile, virtually adds a square mile to the national territory—nay, he does more, he doubles to this extent the territorial resources of the country, without giving the state any larger actual area to defend. All hail, then, to the improvers of the soil! health and long life be their fortune—may their hearts be light and their purses heavy—may their dreams be few and pleasant, and their sleep the sweet repose of the weary—may they see the fruits of their own labor, and may their sons reap still heavier harvests.—*Blackwood's Magazine.*

NATIONAL CATTLE SHOW.—On the 25th and 27th of October next, there is to be a great Cattle Show at Springfield, Ohio. Twenty acres of ground have been inclosed, and 200 stalls erected for cattle.

Agricultural Miscellany.

A MANUFACTURED QUOTATION.—I refer your correspondent "Farmer," to Harris' Prize Essay on Phosphoric Acid, contained in the Patent Office Report for 1852–3, page 402; also page 391. He says:—"It is now universally admitted that these two (Ammonia and Phosphoric Acid) are *the* valuable elements of *all* manures, and effects have been attributed to ashes and marble, and even lime, which were entirely due to the Phosphoric Acid they contain."—*Correspondent of the Del. Rep.*

In the essay on Superphosphate of Lime, published in the Transactions of the New York State Agricultural Society in 1852, and copied into the Patent Office Report, we may have said that "ammonia and phosphoric acid were the most valuable elements of all manures," for such we believe to be the case; but we certainly did not say that the effects of "ashes, marble and lime were entirely due to the phosphoric acid they contain." We have turned to the pages referred to, and can find nothing of the kind; and are satisfied we never penned such obvious nonsense. We suspect the correspondent of the *Republican* copied it from some Mexican guano or mineral phosphate *advertisement.*

PLASTER AS A FERTILIZER.

M. MENE, a French chemist, has come to the conclusion that "Plaster has not of itself any fertilizing quality; it only acquires this property when it comes in contact with those ammoniacal salts which it is capable of decomposing. It would thus appear that it may be replaced by any other salt capable of returning ammonia in a fixed state at ordinary temperatures." The experiments seem to have been very carefully made, and we submit this fact to the consideration of our intelligent readers. The use of covering dung heaps with plaster is thus explained.

We find the above going the rounds. The idea that the value of plaster is owing to its converting the volatile carbonate of ammonia, into the fixed salt, sulphate of ammonia, is not new with M. MENE. LIEBIG, and a host of his satellites, have been advocating this theory of the action of sulphate of lime for 20 years.—But like many others of LIEBIG's brilliant theories, it is opposed by so many indisputable facts, that at the present day, nearly all chemists who have any practical acquaintance with agriculture, have abandoned it.

SUPERPHOSPHATE OF LIME VS. GUANO.

THE editor of the *American Agriculturist* has recently visited the farm of Mr. JOHN S. RANDOLPH, Bound Brook, N. J., who is making the following interesting experiment:

In the same field, one large plot was treated with 300 lbs. of guano per acre, another with 300 lbs. of superphosphate; a third with a mixture of 300 lbs. of guano, and 250 lbs. of superphosphate; and a fourth plot was left without any fertilizer. The guano and superphosphate were both sown at the time of putting in the crop last fall. We went over this field, and found that the poorest in appearance is that without any fertilizer; the superphosphate portion is a little better than this, but that having guano alone is far superior in color and growth, and apparently is fully equal to that part having superphosphate with the guano. From present appearances, the money paid for the superphosphate, was so much thrown away; but the ultimate yield may be different, and we hope Mr. Randolph will give us the result at harvest.

TASTE IN AGRICULTURE, &c.

THE following eloquent passage, we extract from an address delivered before the Southern Central Agricultural Society at Augusta, Ga.

"Agriculture, if profitable, I know, is not a pastime; but it ought not to be rejected because of its sweat, and dust, and toil, as if it had no charms beyond its gains, no pleasure beside the joy of possession. If we expect to ennoble and elevate it, we must associate it with science, intelligence, and taste; throw around it the attraction of cottages, and gardens and flower-beds, and orchards. The farmer's dwelling must become the home of hospitality, and knowledge, and refinement. But while the gin-house is the best house on the premises, the cotton-blossom the only flower that throws its fragrance on the air, a worm fence—the unsightliest thing in all the land, except the drunkard, whose reeling pace it most resembles—the only enclosure, who could admire a country home and a farmer's life?"

A VALUABLE COW.—We have an account of a cow owned by John B. Decker, of Waulage, N. J., that is *thirty-two years old*, and has a young calf, the fifteenth in nine years.—She has brought over forty calves in her time. She gave 20 to 24 quarts of milk per day last summer. She was raised by the father of the present owner. Her teeth are yet good. This cow with all her descendants, if alive, would make one of the greatest cattle shows ever seen in this country.—*Ex.*

We have had some wonderful cows in New York, but now New Jersey certainly possesses the most remarkable cow that ever had her deeds recorded in type. We would propose, if she should ever go the way of all flesh, that a monument be erected to her memory, or that of the getter-up of the story.

THE LIVINGSTON CO. STOCK ASSOCIATION propose to sell their imported stock at auction, on Tuesday next. See advertisement.

HONEY BEES.

THE Albany Cultivator has an interesting article on honey bees, from the pen of a distinguished professor, from which we quote the following paragraph:

"Many, nearly everybody, suppose that the bee culls honey from the nectar of flowers, and simply carries it to his cell in the hive.—This is not correct. The nectar he collects from the flower, is a portion of its food or drink; the honey it deposits in its cell is a secretion from its mellitic, or honey secreting glands, (analogous to the milk secreting glands of the cow and other animals.) If they were the mere collectors and transporters of honey from the flowers to the honey comb, then we should have the comb frequently filled with molasses, whenever the bees have fed at a molasses hogshead. The honey-bag in the bee performs the same functions as the cow's bag or udder; merely receives the honey from the secreting glands, and retains it until a proper opportunity presents for its being deposited in its appropriate storehouse, the honey comb.

"Another error is, that the bee collects pollen from the flowers accidentally while it is in search of honey. Quite the contrary is the fact. When in search of nectar, or honey, as it is improperly called, the bee does not collect pollen. It goes in search of pollen specially, and also for nectar. When the pollen of the flower is ripe, and fit for the use of the bee, there is no nectar; when there is nectar, there is no pollen fit for use in the flower. It is generally supposed, also, that the bee constructs the wax from which its comb is made, from such vegetable substances. This is likewise an error. The wax is a secretion from its body, as the honey is; and it makes its appearance in small scales or flakes, under the rings of the belly, and is taken thence by other bees, rendered plastic by mixture of the bee's mouth, and laid on the walls of the cell, with the tongue, very much in the way a plasterer uses his trowel."

TREATMENT OF GAPES.

IN one of the numbers of your useful publication, I see that a correspondent calls the gapes "an incurable disease." As I have yearly reared a large number of chickens, I think it right to state that I have found spirits of turpentine, if not specific, at least an almost certain remedy for this complaint. I have administered it in two ways, and both successfully. First, with chickens of larger growth, by dipping a feather in the spirit and passing it down and turning it round in the throat of the patient, by which means the little worm causing the complaint is sometimes extracted, but nearly always destroyed; and secondly, with young birds, dropping a few very small crumbs of bread saturated with the spirit into their pens, which, if hungry, they will pick up quickly. I know a gentleman, a very large breeder of fowls, who always gives his chickens, at six weeks old, wheat steeped in turpentine. This was given to them *once* in the morning when fasting, and as a prevention against, instead of waiting for, the arrival of gapes. I may trouble you again on this and other subjects relating to poultry, should you think further communication likely to prove interesting to your readers.—*Poultry Chronicle.*

LARGE PUMPKINS.

HAVING had good success the past season, in raising fine large pumpkins, I will give you my plan and experiment. The ground planted was a warm, clayey loam, descending to the south.

I planted the 20th of May, with corn and one or two pumpkin seeds in a hill: used about one table-spoonful of plaster or gypsum to the hill. The field was a clover sod, plowed once and harrowed three times. When the vines commenced to run, say one foot in length, I gave them a careful hoeing. After the fruit was well set, or some were six to eight inches in diameter, I covered the stem, and a large portion of the vine joining the stem, with moist, loose soil; the result was, that roots directly from the stem of the pumpkin were formed, and the fruit derived sustenance, and plenty of it, judging from the size and weight, which was from eighty to ninety pounds.—*Plowboy.*

CONSUMPTION IN FOWLS CURABLE.—A correspondent of the *Poultry Chronicle*, a new publication devoted to the poultry interest, announces consumption curable among fowls. Cod liver oil, whose virtues seem to be unlimited, is in this instance the saviour and fattener of skinny cochin cockerel. We are told that "the best way to exhibit this medicine is in Scotch oatmeal, for, singularly enough, it mixes with it much better than in barley flour.—The dose is a full tea-spoonful three or four times daily. After about two days, the circulation seems improving, for gradually the livid character of the comb and wattles, as also their general appearance, gives way; and from this time (the medicine still continued) the bird improves alike in flesh and spirits. I repeat, I am not friendly to much doctoring of poultry; but finding not a single instance has come to my knowledge of recovery by the many other means adopted, and where the oil was freely administered not a death occurred, I have ventured to forward my experience for the benefit of your readers."

BONES may be decomposed by putting them between layers of wood-ashes, moistened in a barrel. Bones and egg shells should be thus disposed of as fast as they come from the kitchen. A strong heating compost heap will decompose bones. Diluted oil of vitriol in an old kettle or big earthen jar, is a good thing into which to cast the waste bones.

B. P. JOHNSON, Esq., secretary of the New York State Agricultural Society, will deliver the address before the Hampshire, Franklin and Hamden, (Mass.,) Agricultural Society, on the 12th of October next.

WASHING SHEEP.

WASHING sheep is not only laborious and disagreeable to the men who perform the work, but may be hurtful to the sheep. In Merinos, the dirt adheres closely, and the animal must be immersed a considerable time to cleanse the fleece effectually. The water, therefore, should be at a bearable temperature, and to secure this it is necessary to defer washing till the latter part of May or first of June. The English breeds of sheep carry less dirt in the fleece, and from their less amount of yolk and its less adhesive quality, they are more perfectly cleaned with much less washing. Sheep generally struggle in the hands of the washer, and unless he is careful, their limbs or back may be severely injured.

Soft water should be obtained for washing sheep, if practicable, as it more readily cleans the wool, and does not require the immersion of the sheep for so long a time. When the sheep are collected for washing, it is useful to sprinkle them with water, and let them stand for a few hours. This causes the impurities of the fleece to separate more readily, when subjected to washing. Leaving the sheep out in a warm rain just before they are washed, answers a similar purpose.

After having been shorn, sheep require protection both against storms and hot sunshine. The animal is suddenly exposed to very different influences from those which surrounded it previously to this operation, and its health is sometimes much affected by them. Cold rains frequently occur, and diseases of more or less severity are the consequence. The animals should have at least the shelter of sheds in bad weather. Exposure to a hot sun while the skin is naked, frequently occasions blisters, and injures the quality of the first growth of wool—making it harsh and dry. If they are allowed shade, they will gladly avail themselves of this protection, feeding mostly at morning and evening.—*Boston Cultivator.*

FARMERS.

ADAM was a farmer while yet in Paradise, and after his fall, commanded to earn his bread by the sweat of his brow.

Job, the honest, upright and patient, was a farmer, and his endurance has passed into a proverb.

Socrates was a farmer, and yet wedded to his calling the glory of his immortal philosophy.

St. Luke was a farmer, and divides with Prometheus the honor of subjecting the ox for the use of man.

Cincinnatus was a farmer, and the noblest Roman of them all.

Burns was a farmer, and the Muse found him at the plow, and filled his soul with poetry.

Washington was a farmer, and retired from the highest earthly station to enjoy the quiet of rural life, and present to the world a spectacle of human greatness.

To these may be added a host of others who sought peace and repose in the cultivation of their mother earth; the enthusiastic Lafayette; the steadfast Pickering, the scholastic Jefferson, the fiery Randolph, all found an Eldorado of consolation from life's cares and troubles, in the green and verdant lawns that surrounded their homesteads.

PLANTING SMALL POTATOES.

WE have given no little attention to this subject for many years, and have settled the matter conclusively in our own minds, that it does not pay to plant small seed. For fifteen years we planted the same nameless variety, on the same soil, and at the end of that time, found no deterioration in the quality or yield, but rather an improvement. We have invariably thrown out from our seed all potatoes less in size than a hen's egg, and also rejected those overgrown, pithy, or irregular shaped.

In some favorable seasons, and on particular soils, those purchasing and planting the small potatoes which we have rejected, have raised crops equal to or more prolific than our own; but one year with another, we have averaged thirty to fifty per cent. better crops of good potatoes, than our small potato neighbors.

What we have found true in regard to potatoes, we have also, by long practice, proved true in regard to other kinds of seed. Our plumpest and earliest grains have always been reserved for propagation, and our neighbors can testify that our practice has been attended with good results.—*American Agriculturist.*

THE SALT LAKE OF UTAH.—Experiments have been made upon the properties of the water of Salt Lake, Utah, for preserving meat, by Mr. Stansbury and his associates. A large piece of beef was suspended from a cord and immersed in the lake for over 12 hours, when it was found to be tolerably well cured. After this, all the meat they wished to be preserved was packed into barrels without any salt whatever, and the vessels were then filled with lake water. No further care or preparation was necessary, and the meat remained perfectly sweet, although constantly exposed to the atmosphere and sun. They were obliged to mix fresh water with the brine to prevent the meat becoming too salt for present use.—*Ex.*

HEAVY CALVES.—Our friend, J. H. Underwood, Esq., who always rears the best stock, writes us that he now has a heifer calf, three-fourths Hereford, which weighed, the day before it was three months old, three hundred and forty-five pounds; and a bull calf, half Hereford, which weighed, at two months and nineteen days old, two hundred and ninety-one pounds. They have not had extra keep.—*Mo. Farmer.*

DAVID GAY, of New London, N. H., says gargel root, steeped in water, will cure sick pigs, if they are allowed to drink as much as they will of the liquor. It is a sure remedy for blind staggers and rostiveness, and excellent in other diseases. It is also good for cattle.

Orchard and Garden.

SCHONHERR'S WEEVIL.

This insect pertains to the weevil family (*Curculionidæ,*) and is one of the largest of that kind of insects found in this country. It was named by the late Rev. Mr. Kirby *Pachyrhynchus Schonherri,* in honor of the Swedish Entomologist Schoenherr, who has devoted a great deal of attention to this class of insects. Dr. Asa Fitch, the Entomologist of the N. Y. State Ag. Society, to whom the writer sent specimens the past season, describes it in Vol. 4, page 36, of the Journal of the N. Y. State Ag. Society. "This weevil, though variable in size, is commonly over half an inch in length, and is about two and a half lines broad. It is of a gray color, produced by short, whitish hairs upon a black ground. Upon the thorax are three white stripes more or less distinct, and upon each wing cover are four white stripes which are interrupted by small black spots. These marks will suffice to distinguish this from other insects. We have a long-horned beetle, the grub of which lives in pine timber—the *Rhagium lineatum*—which is much more common, and strikingly resembles this weevil in size, color and form, but is readily distinguished from it by having a projecting spine, or tooth, on each side of the thorax.—Hitherto, so far as I am aware, nothing has been known respecting the habits of this weevil. It is rather a rare insect, I should judge, for I have never seen but three specimens of it before." Dr. Harris, who also received specimens from Wisconsin, remarks concerning it in the same No. of the Journal.

"It is the *Rhycerus Noveboracensis* of my Catalogue of the Insects of Massachusetts, printed in 1835. Though not a very abundant species here, it is by no means rare, and it seems to have a wide range through the country, being found in most of the New England States, in the Middle and in the Western States, in Canada and in Newfoundland. I have taken it in Massachusetts, on forest trees, particularly oaks, in June and July; but never met with it on fruit trees. Nothing is known to me of its habits in its early stages."

The writer has taken specimens of this insect from his young orchard for three years past. The present season the numbers of it have increased, though not as yet to any alarming extent. It is very voracious in appetite, and seems to be particularly fond of the young and tender shoots of the apple, which it gnaws at their base and elsewhere, at times completely off, and frequently so much that they wither and die or are broken off by the wind. They are dull of motion, and when not feeding recline under a leaf, or more usually, especially if it be at all windy, in the axil of a shoot or leaf. It will be seen, therefore, if their numbers were to increase much they prove a formidable pest to the orchard. Vigilance should be the watchword with every one, not only to meet this threatening foe, but all others. United efforts may meet and conquer an approaching enemy, while the numbers are few, with ease; but which, if permitted to advance, may defy all opposition. Injurious insects increase on us from year to year, and those that ordinarily may be insignificant from their small numbers, at times increase, so mysteriously, as to cause incalculable damage. So far as the writer's observation has extended, the above weevil makes its appearance soon after the young shoots start, and remains till nearly or quite the middle of June. Where their numbers are thick, sheets might be spread on the ground, the tree suddenly jarred, when most of them would fall, when they might be gathered up and shaken into boiling water and afterwards fed to the poultry. Still some might adhere in the axils, and the tree should be well searched with the eye. T. E. W.

POTTING STRAWBERRIES.

Mr. Rivers, in London, raises strawberries in pots by a peculiar process, thus described:

About the second week in July, he says he filled a number of six-inch pots with a compost of two-thirds loam, and one-third rotten dung, as follows:—three stout pieces of broken pots were placed in the bottom and a full handful of the compost put in; a stout wooden pestle was then used with all the force of a man's arm to pound it, and then another handful and a pounding, and another, till the pot was brimfull, and the compressed mould as hard as a barn floor. The pots are then taken to the strawberry bed, and a runner placed in the centre of each, and a smaller stone to keep it steady. They were watered in dry weather, and have no other care or culture.—For two or three years I have had the very finest crops, from plants after this method, and those under notice promise well. If the pots are lifted, it will be apparent that a large quantity of food is in a small space. I may add that from some recent experiments with compressed earth to potted fruit trees, I have a high opinion of its effect, and I fully believe that we have yet much to learn on the subject. —*Valley Farmer.*

Tomatoes should always be hashed just as much as peas, and who but a sloven would think of raising the latter without any support.

FLOWERING ASH.

Flowering Ash; (*Ornus Europæus.*)—This is neither a rare nor a common tree, a native of the south of Europe, but introduced into this country a long time ago, and widely disseminated, but confined to larger collections of trees. There is an American species, so similar in appearance as to be pretty generally believed to be only a variety. It resembles the common ash in its general features.—Habit stiff and erect; with grayish bark; stout, blunt shoots; and large, dark buds. Leaves consisting of three or four pair of elliptic or lanceolate leaflets. Flowers, which appear in the latter end of May or beginning of June, are of a greenish white, produced in large clusters or panicles on the ends of the branches.—These clusters are shorter than the leaves that surround them; and when the tree is in full bloom, it looks as though a pretty white bouquet of delicate flowers, tastefully encircled by foliage, were placed on the end of every branch. The annexed figure will give a slight idea of the relative situation of the leaves and flowers, and their appearance.

It is propagated by budding or grafting—the latter is preferable—on the common ash—It grows slowly, and attains a height, in time, of twenty to thirty feet. Specimens in our grounds, ten years planted, are twelve feet high. In Italy, where this tree abounds indigenously, the sap is taken from it in the summer, as we take the sap from the sugar maple in the spring; and as it cools, it hardens and granulates, and is then called "manna," and is that now generally known in commerce.—P. Barry.

THE ARBOR VITÆ.

This is a very pretty evergreen tree, especially when young and when grown in open grounds, which with judicious trimming secures for it a thick, bushy habit. The tree is a native of these parts, and is found wild in great numbers along the south bend of Lake Michigan. It bears transplanting much better than most evergreens, and may be cut with no risk whatever; a process to which some varieties submit with considerable impatience. It may also be grown with little difficulty from the seed, which may be gathered along in September or October. It hangs on the leaves in great quantities: and may be either planted immediately or kept till spring. Prepare a bed in a sheltered situation, with a rich mellow and moist soil, and sow with a slight covering.—The seeds vegetate readily; but the plants grow but feebly at first, and demand some protection from the hot sun the first summer, and also from the cold during the first winter.

The Arbor Vitæ is called—but wrongly—in some places the White Cedar. It makes a fine ornamental hedge for awhile, but is inclined to make too much wood for a permanent fence.—*Prairie Farmer.*

Hints for Beginners.—We urge upon beginners the propriety of exercising great caution in making their first selections. Every tree, shrub, and plant should be perfectly hardy, and of the easiest cultivation. New and rare trees and plants are generally those most noticed in the periodicals, and beginners are apt to think they must have these; but in this they are wrong. Inquire not for novelties, but for old and well-tried species and varieties that have been proved to succeed everywhere and with even indifferent treatment. These are what you need; and when you have attained complete success with them, and have become somewhat familiar with the nature of the different tribes of plants, and with the principles as well as details of culture, you may safely enlarge your collection.—*Horticulturist.*

Curious.—In Minnesota, there grows a small plant which bears a living insect. The insect does not come to perfection until the plant begins to wither. When the withered bud opens, the insect flies away. It is a brown bug. Who ever heard of such a plant before? We never did.—*People's Jour.*

Levi Parker, of Wilmington, states that pines and other evergreen trees pruned in the latter part of May or early in June will not bleed or be injured by the operation of pruning. He has tested them by many trials.

Mulch about young trees, shrubs, currants, gooseberries, or anything else you wish to keep moist—this and deep plowing are the antidotes for drought.

A New Use for Collodion.—Cotton-powder, dissolved in ether, forms a varnish which sticks fast, dries quickly, is impermeable to water, and impenetrable to air; it is called collodion, and is much used in surgical cases. A gardener has just discovered that it may be made of vast utility in producing plants and shrubs from cuttings. On making the cuttings, the varnish is applied to the part cut, which immediately becomes closed, or, so to speak, healed. The cutting is then planted in the ordinary way. Out of twenty-six cuttings of hot-house plants to which collodion was applied, twenty-three struck root, whereas out of the same number to which it was not applied, only twelve succeeded. With plants kept in green-houses, and in those in the open air, even more satisfactory results have been obtained. The collodion may also be advantageously employed in grafting.

Strawberries are remarkably abundant and fine this year, owing to the timely rains and warm, cloudy weather. At the exhibition of the Cincinnati Horticultural Society, a few days since, there was a display of this fruit.—The first premium was awarded for "McAvoy's Superior," specimens of which measured over five inches in circumference; and besides being very large, it is found a good bearer and of fine flavor.—*Ohio Cult.*

Fruit in Pennsylvania.—From all the evidence we can gather, the fruit crop in this state, will, this season, be a failure—even more entirely than last year. Apples, pears, and cherries, all seem to have been destroyed by the severe weather in April. The snow storm does not seem to have affected them nearly so much as the subsequent frost.—*Ger. Tel.*

Domestic Economy.

New York Cake.—1 cup of butter, 2 cups of sugar, 2 cups of flour, 6 eggs, 1 tea-spoonful of cream tartar, one-half of soda; 1 cup of raisins, and one of currants, can be added if you wish Fruit Cake, by leaving out the soda and cream tartar.

Wine Jelly.—1½ ounces of isinglass, 1½ lbs. of sugar, 2 lemons, 1 quart of wine. Make a syrup of the sugar, and clear it by putting in the lemon cut in slices. When you put on to boil, the isinglass must be dissolved into the syrup. When nearly cold, add the wine.

To get rid of Moths.—The *American Agriculturist* says camphor gum put amongst old carpets, blankets, &c., when they are stowed away, is a sure preventive against the injuries of moths.

Keeping Lemons Fresh.—I have been a house-keeper for some years, and never till lately, have I been able to keep lemons fresh or juicy to any length of time. But, with all my care—now in this closet, now in that—now wrapped in paper, now packed in bran—now in a cool place, now in a dry one—they would dry up and become hard as wood. Of late, however, I have preserved them perfectly fresh, three months, in summer, by placing them in a closely covered jar, or pot, kept in the ice-house. Each lemon is wrapped in a paper, (perhaps they would do as well without,) but open and wiped once in ten or twelve days, then covered again with dry paper, and put back into the jar, or earthen vessel, on the ice. —*American Agriculturist.*

Ink and Iron Mould.—May be taken out by wetting the spot in milk, then covering them with common salt. It should be done before the garments have been washed. Another way to take out ink is to dip it in melted tallow. For fine, delicate articles this is the best way.

Raspberry Cream.—Put six ounces of raspberry jam to a quart of cream, pulp it through a lawn sieve, add to it the juice of a lemon and a little sugar, and whisk it till thick.—Serve it in a dish or glasses.

Ginger Snaps.—Two pounds of flour, one-half pound of butter, one-half pound of sugar, one-half pint of molasses, one tea-spoonful of saleratus, two table-spoonfuls of ginger; flavor with cloves or cinnamon.

Red Ants may be driven away by sprinkling fine sea-shore sand upon the shelves.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,
For the week ending June 13, 1854.

Dominique Emile Coularet, of Roxbury, Mass., for improvement in the manufacture of sulphuric acid. Patented in England, Dec. 16, 1853.

Wm. R. Palmer, Elizabeth City, N. C., for improvement in threshers.

Joseph Iler and Wm. Fitzpatrick, Troy, N. Y., for improvement in nail-plate feeders.

Tyler Howe, Cambridgeport, Mass., for improvement in bell bottoms.

Thos. Ashcroft, Dorchester, Mass., for improvement in operating cut-off valves for steam engines.

David Prew, Taunton, Mass., for improvement in cast-iron car wheels.

Casimir Abbs, New Brunswick, N. J., for improvement in spark arresters.

John M. Bachelder, Cambridge, Mass., for improvement in insulating telegraph wires.

Samuel Childs, New York, for improvement in stills for distilling fatty bodies.

Silas Constant, Brooklyn, N. Y., for lens-lamp chimney.

Nathaniel Dodge, Orford, N. H., for improvement in the construction of accordeons.

Anthony Faas, Philadelphia, for improvements in the construction of accordeons.

Eli H. Green, Baltimore, Md., for improved carriage axle.

Geo. P. Gordon, New York, for improvement in tail-boards.

F. M. Harris, Carroll, O., for improvement in tail-boards of wagons.

R. M. Handley, Lynchburg, O., for improvement in bed-bottoms.

Bernard Hughes, Rochester, N. Y., for improvement in vises.

Wm. E. Jones, U. S. Army, for improvement in saddle-trees.

Joseph Keech and Stephen Stillwell, Waterloo, for improvements in winnowing machines.

Wm. Montgomery, Roxbury, Mass., for improvement in machine card-teeth.

J. Vaughan Merrick, Philadelphia, for improvement in exhaust fans.

Andrew Overend, Philadelphia, for improvement in printers' frishets.

Chas. A. Wilson, Newport, Ky., for improvement in operating valve for steam-pumps.

Martin Newmann, (2d,) and N. C. Whitcomb, Danesborn,' Pa., and H. C. Cole, Hartford, Conn., for improvement in coupling.

David L. Lafourtte, St. Louis, for improvement in mills.

Bronson Murray, Farm Ridge, Ill., assignor (through T. Rush Spencer, Geneva, N. Y.,) to John S. Wright, Chicago, Ill., for improvement in harvester cutters.

David N. Kownover, Dansville, Pa., assignor to Richard L. Kownover, Milton, Pa., for improved mode of closing wickets in canal gates.

Lyman Clark, Royalston, Mass., assignor to Lyman Clark and Joseph Sawyer, for instrument for trimming welts of hats, shoes, &c.

Chas. Perley, New York, for improvement in adjustable rails for replacing cars on the track.

Chas. Perley, New York, for improvement in chain cable stoppers.

Samuel Perkins, London, Eng., for improvements in crushing and grinding quartz and minerals. Patented in England, Oct. 12, 1852.

Merritt F. Potter, Charlemont, Mass., for improvement in railroad odometers.

Ebenezer N. Price, Salem, Mass., for improvement in bridle bits.

Isaac Starks, Genoa, N. Y., and Lyman Perrigo, Croton, N. Y., for improved device for bolting pieces in spoke machines.

James L. Rowley, Steuben County, Ind., for improvement in carriages.

Ira Reynolds, Republic, O., for improvement in harvesters.

Chas Schinz, Camden, N. J., for improvement in processes for hardening tallow.

John Stowell, Charleston, Mass., for improved steering apparatus.

Peter Sweeney, Buffalo, N. Y., for improvement in steam boilers.

Wm. Sinire, Elizabethport, N. J., for improvement in buckles.

E. H. Sprague, Zanesville, for improvement in locking up printers' forms.

Thos. Sitrel, Philadelphia, for improvement in tightening windows.

David J. Stagg, Hoboken, for improvement in operating bolts and locks, for controlling series of doors.

G. B. Simonds, New Haven, Conn., and Abel Brewer, Saugatuck, Conn., for improvement in spark arresters.

Henry C. Sergeant, Cincinnati, for improvement in feed-water apparatus to steam boilers.

Thomas, Earl of Dundonald, London, Eng., for improvement in compositions for coating telegraphic wires, and for other purposes. Patented in England, Oct. 6, 1852.

J. C. Taylor, Camden, N. J., for improvement in soap compounds. Patented in England, Sept. 17, 1853.

J. C. Taylor, Camden, N. J., for improvement in soap manufacturing processes. Patented in England, Sept. 17, 1853.

Anthony Vitally and Carl Kohl, Newark, N. J., for improvement in securing tools to their handles.

George Yates and Eli Clayton, Lancaster, Pa., for improvement in looms.

John Regan, Jersey City, for railroad car ventilator.

James Wightman, Pittsburgh, for improvement in steam-boilers.

Geo. W. Wood and Lucius G. Webster, Utica, for improved canal lock gates.

Geo. Westinghouse, Central Bridge, N. Y., for endless chain horse-power.

Edmond Victory, Watertown, N. J., assignor to D. M. Linsley and Geo. Goulding, of same place, for improvement in machinery for spinning wool.

DESIGN.

Apollos Richmond, Providence, R. I., assignor to A. C. Barstow & Co., of same place, for design for cooking stoves.

Some people do not know, as all ought to, that wood ashes kept for a time in such a situation as to become damp, will spontaneously ignite and set on fire any wood with which they come in contact. Ashes kept perfectly dry are safe, but it is better to have an ash bin constructed of brick or stone, so as to obviate the possibility of an accident.

Fence Posts, steeped in a solution of blue vitriol—one pound of vitriol to forty pounds of water—will last forever and be pretty good after that.

PAPER FROM BOG HAY.

The use of paper increases every day, and it is made from various substances. In many places a great quantity of wrapping paper is made wholly or in part from straw. This is found to be more or less profitable according to the price of straw, and the economical arrangements made in manufacturing it. Will not the grass cut in our low, swampy, wet lands, commonly called bog hay, afford a useful material from which to manufacture wrapping paper? We have no doubt it will, and from experiments that are here tried, are satisfied it will. But we are no paper-maker, and have no apparatus or machinery to test it thoroughly. Our experiments were directed to the maceration of it in alkaline solutions, and the reduction of it to a crude sort of pulp. We throw out the hint for what it may be worth, and hope that it may be acted upon and thoroughly tested by somebody who has both the means and skill to ascertain the fact whether it is of any value or not. If bog hay can be put to this use successfully and profitably, many sections of Maine can supply large amounts of it, and thousands of acres of wet and now useless alder swamps might be cleared up and converted to a very useful purpose.

There are many other natural substances found quite abundantly in Maine, or which might be raised, which would afford material for this kind of manufacture. Where do the hornet and yellow wasp find stock to make the strong, coarse paper of which they build their nests, and how do they prepare it? The hornet is a natural born paper-maker, and makes a good, durable article. He puts in a water-proof sizing which it would be worth while for some of our paper-makers to imitate if they can. Of what is this sizing made. One of their nests will hang out in the snows of winter and rains of summer and not be injured in the least, and yet the paper is soft and pliable.—Here is a model for you, paper makers. Learn of the hornet and be wiser.

P. S. Recent improvements have rendered paper from straw fit for printing on. Since writing the above we have met with the following paragraph from the "Scientific American." "The Dollar Newspaper," like the "Philadelphia Ledger," comes to us this week printed on paper made from straw by Mellier's process. This paper is really excellent and beautiful. It is much stronger than paper made from rags; it is firm and hard like linen paper, and is white as any paper printed in the country.—*Mc. Far.*

IMPROVING TALLOW FOR CANDLES.

People must have light of some kind or other, and so they adopt all kinds of inventions, from splinters of pitch knots to gas. In old times the common tallow candle was in general use, and one of the indispensable duties of the farmer's wife, in the beginning of winter, after the "*beef had been killed,*" and the "*tallow tried out,*" was to make up a year's stock of candles. Oil is now more generally used, and makes a better light. Still many prefer candles, and for their use we abridge from an exchange the following alleged improvement, practiced recently in some parts of England, which may may be easily tried by those who feel disposed to do it.

It has been patented in England, but not in this country, so you can use it if you wish without fear of molestation from any patentee. When the tallow for making candles is melted in the kettle, about one-seven thousandth by weight of its quantity of acetate of lead (common sugar of lead) is added, and well stirred among the whole for 15 minutes. The heat is then lowered, but the tallow is retained in a liquid state.

About one thousandth part by weight of turpentine, and a little of any of the perfumed resins are then thrown in and all well stirred together until the whole are thoroughly incorporated together, this takes about two hours for stirring, and one hour of rest for the uncombined impurities to settle to the bottom. The acetate of lead makes the tallow hard, and much superior to tallow not so treated; and upon the whole the composition makes very superior candles.

Gibbs' Rotary Digging Machine.—Prof. Mapes thinks this machine, judging from experiments with the first rough machine, will do more than three times as much work as a plow, and more than three times as well, with the same team. The plow requires just as much propelling power to overcome the friction of the land slide as it does to turn over the furrow slice, and all that friction is worse than thrown away—it compacts the land and injures it. There is no power lost in this implement; it is like forking over the soil, and will work three feet wide and fifteen inches deep with one pair of oxen, rendering the land more pulverulent than a dozen plowings. We know nothing practically about this machine; but until we have ocular proof of its value, we shall not believe that it can be a substitute for the plow. "Forking up," unless it is done thoroughly, will not result as beneficially to crops, as plowing. We saw some sort of machine of this kind, at the Crystal Palace, but it was not deemed worthy of special or any notice.—*Germantown Telegraph.*

Elliot's Golden Harvester.—We have examined a very neatly constructed model of what may be termed a double-acting reaping machine, invented by Augustus Elliot, of California. Mr. E. exhibited a model at the Crystal Palace last year, where his invention was favorably regarded. The model is hinged in the centre, and has cutters on each side of the hinges. It may be regarded, in effect, as a combination of two reapers. One or both cutters may be worked as desired. A series of bands are also attached, intended to gather up the straw, and bring them out at one side commonly for the binder. The horses are placed behind. The invention, we believe, has not been tried practically, therefore it is impossible to judge with certainty of its success. —*People's Journal.*

Educational.

[Written for the Rural New-Yorker.]

CONVERSATION.

It has been said that the ability to *talk* well is much more common than the power of eminent *conversation*—that good talkers are frequently met, good conversationists rarely. The remark supposes, and justly, an important distinction between talking and conversing—a distinction founded not only on a difference in the qualities that respectively make up the fluent talker and the brilliant conversationist, but also on the different relations sustained by each to the company he may happen to be in.

Talking requires only a speaker and a hearer; conversation, two speakers. The superiority of the latter over the former as a merely intellectual exercise, will appear in this, that while the talker proposes only to present his views, backed by such arguments as to him seem best calculated to support them, without taking the trouble to hear and answer objections to them, the successful conversationist, on offering his opinions, must be prepared to defend them on the instant, not only against common adverse reasoning, but sometimes against sudden and unexpected attacks. The necessity of doing this, demands the cultivation of a habit of promptitude—a habit to be acquired only by much practice, but of incalculable value to the conversationist or debater. Many persons who have plenty of good ideas lack this readiness—cannot command their thoughts at a moment's notice, and this disadvantage is to be overcome only by frequent and persevering efforts. Again, a man becomes much better acquainted with his own intellectual resources, and is oftener led to review the grounds on which his opinions were based, by measuring his strength against that of people entertaining opposite opinions from himself, than by merely communicating his own ideas, and declining the benefit of criticism upon them. Weak points may be exposed, and slender arguments overthrown, and each party to the conversation rise with more humility, but perhaps not less wisdom, than he sat down.

As a social accomplishment, the art of conversation is worthy of the most careful culture, for it is, perhaps, of all modes of entertainment, the most universally and lastingly agreeable. Other resources weary after a time; pleasant conversation never. Even if not embellished by sparkling wit, or laden with profound reflections, it affords a vehicle for many curious suggestions and glimpses of thought that would never, perhaps, be committed to paper, but that sometimes reflect the quality of one's mind more truly than a formal attempt at revelation would do. If half the time wasted in "small talk," were spent in endeavoring to converse sensibly and entertainingly on topics of some importance, we might, in a measure, overcome that awkwardness and hesitation which many of us experience when called upon unexpectedly to state our opinions in reference to questions of general interest.

We can easily think, afterward, of enough we *might* have said, had it only occurred to us at the proper moment. Being accustomed, too, to speak generally of trivial subjects, when an answer to a happy remark readily presents itself, we waver so long between an impulse to speak and the fear of being *too original*, that the occasion passes unimproved. It will be well to remember that that is not genuine sociability which requires that conversation be kept up, no matter how forced it may be; we must respect the moods of our friends: if they are inclined to talk, we are of course glad to hear them; if not, their silent presence should be more to us than a conversation in which they bear a constrained, unwilling part. A.

South Livonia, N. Y., 1854.

The Board of Education in New York, have elected S. S. Randall, Esq., City Superintendent of Common Schools.

They could not have chosen a more capable, efficient or worthy man. Mr. Randall has been Deputy State Superintendent of Schools for the greater part of the last fifteen years, and is more identified with School Reforms and the progress of Education than perhaps any one else in the State. His election is matter of congratulation not only to his friends, but to the city which has secured his services.

The principal opposing candidate, we understand, was Mr. Barnard, formerly of Connecticut and now Superintendent of Schools in Cincinnati. The contest was a spirited one, but Mr. Randall was chosen by a large majority.

It is wrong to believe that frank sentiments and the candor of the mind are the exclusive sharers of the young; they ornament oftentime old age, upon which they seem to spread a chaste reflection of the modest graces of their younger days, where they shine with the same brightness as those flowers which are often seen peeping fresh and laughing, from among ruins.—*Poincelot.*

The motives and purposes of authors are not always so high and pure, as, in the enthusiasm of youth we sometimes imagine.—*Longfellow.*

Minds which never rest are subject to many digressions.—*Joubert.*

The Essayist.

[For Moore's Rural New-Yorker.]

"THE PLURALITY OF WORLDS."

BY PROF. DEWEY, D. D.

This work is written in fine style, and is an admirable instance of Analogical reasoning. From various analogies, it has come to be nearly a uniform belief that a vast many of the planets, primary and secondary, and the sun and fixed stars, are the habitations of intelligent and moral beings, who are happy in the service and worship of God, and upon whom his smiles continually rest. The author of the work above, attempts to show that such a belief is utterly groundless, because the great range of analogies leads to the contrary conclusion.

Such a course of reasoning is very attractive to a multitude of thinkers, and this is the reason the work has been so widely spread over the land. It required a great fund of knowledge on all the subjects from which an analogy could be derived in support of his notion, or a contrary analogy be counteracted by a more extensive view. Astronomy and Geology; the discoveries by the telescope in the solar system and in the stellar universe, and of the microscope in the world of infinitessimal being below us and around us; the considerations of design and adaptation; and the knowledge of the intellectual and moral character, as well as the physical constitution of our race;—all these must be wisely examined and applied in the settlement of this subject. In general, all this has been done with great fairness, as well as with great power.

The facts and doctrines of astronomers are stated with perhaps entire accuracy. The argument from Geology is introduced by a lucid exhibition of the real discoveries made by its cultivators. It is not easy to point to so full, and clear, and convincing a statement of the great doctrines of geologists. The author evidently has a very wide and accurate view of the course geologists have pursued, and of the irrefutable certainty of the legitimate conclusions they have made. He has avoided, also, all mere hypotheses, which many geologists have advanced, for the good reason that analogy must be founded on facts to have any power.

He seems to strain the analogy from the long period the earth existed before man began to be an inhabitant of it, or while only the inferior animals were its tenants, and recurs several times to it. Obviously, the mere matter of time is of no consequence to the plan of Him whose dwelling is eternity; and if in time the earth was fitted up to be the residence of man when his Maker should speak him into being, so might other worlds be fitted up in time for a similar result, and the Creator people them with rational and immortal creatures. If the time elapsed already is not adequate, the analogy of our earth shows that it may ultimately be, and thus other worlds come to be what the earth now is in respect to man. This possibility, however, is fatal to his whole argument, for the plain inference he involves is, that what is not now, never will be, in the forming of the planets and stars into inhabited worlds.

There are three things which will prevent most minds from adopting the author's conclusion:

1. Suppose the moon or Jupiter is inhabited by rational beings, and in their wisdom, with all the analogies we have, they conclude that the earth is not inhabited by a rational and moral race. To our apprehension, the plenitude of their wisdom would not appear very magnificent.

2. It must be easy for infinite power and wisdom to adapt races of intelligent creatures to all the supposed diversities of other worlds, when compared with ours. With the same elements, what vast variety in the forms of living things does our earth exhibit, and even in the condition of the human family! The wonder-working hand of the Infinite is displayed in all this diversity. "Great and marvelous are thy works, Lord God Almighty."

3. It is not necessary from any analogy to believe, that the worlds are peopled by successive generations, as on the earth. Other worlds may be inhabited by creatures, who are independent, pure and happy, like angels, without any family relations, but associated and governed by complete benevolence.

It is obvious that material bodies may be actuated by immortal minds, and those bodies not be subject to decay. There may be other senses than those we possess, by which minds may have contact with the external world.—Indeed, the great fundamental difficulty in the mind of the author is, that the inhabitants of other worlds, if such inhabitants exist, must be like ours in all essential particulars,—an assumption not sustained by analogies. We all conceive of the existence of spirits without bodies, and of their knowledge of things that are merely material. There may be such spiritual beings, with or without bodies, who may be devoutly engaged in the admiration of the works of the Creator, and in serving Him with a perfect heart. Hence, no analogy requires the existence of any sin or evil in other worlds. As mind is the great object provided for by the Creator in this world, because it is superior to matter, so the creation of mind and the employment of mind, in the multitude of the planets and stars, would appear to be the highest object for which Infinite Wisdom would act and display his boundless benevolence. As the operation of divine mercy is respected, one world would be adequate for its full manifestation. With this accords that declaration of holy writ, "To the intent that now unto the principalities and powers in heavenly places might be known by the church the manifold wisdom of God."

These three considerations are enough to continue the *belief in the plurality of inhabited worlds.* Should it not be so, no injury is done. No moral consideration is infringed. No danger arises from the belief. The universe is to us only the more full display of the benevolence of God. Creatures are not likely to have a conception of this benevolence, which transcends the greatness of its actual display. C. D.

THE CHIPPING SQUIRREL.

This spirited cut herewith presented represents a little animal found in great numbers throughout the United States, especially in those rural districts which are the abodes of wealthy and grain-producing farmers. The Chipping Squirrel, or in the familiar parlance, "*the chipmuck*," delights to dig his hole at the roots of some old tree upon the hillside, where nuts are plenty and a corn-field not far off.—His quick, sharp cry, as he sits in the sunshine at the mouth of his ground-built home, is one among the thousand pleasant sounds that fall upon the ear of the rural rambler while strolling in the fields.

The Chipping Squirrel is a provident animal, and lays up ample stores against a rainy day. It is true he has no very distinct idea of the difference between *meum* and *tuum* in his appropriations, generally helping himself to such provender as suits his own taste, and, on the approach of the owner, scampers off from the field with his cheeks distended and a loud *chip*, as an "acknowledgment of the corn."

Digging out ground squirrels is one of the favorite amusements of truant school-boys, and one of which the writer retains in his own case very vivid recollections; having once on a time with two other boys taken an afternoon for that purpose without permission of the *school-ma'am*. We were not fortunate enough to catch any of the animals that afternoon, but each of us caught a flagellation next day.

CAREER OF A POET.

It is seventy years ago since George Crabbe published his poem of "The Village." His age was twenty-nine. He was then in orders, and was domestic chaplain to the Duke of Rutland. But what a life the young man had passed through, before he attained that social position! Born in what was then a wretched fishing hamlet, Aldborough, roughly brought up, imperfectly educated, apprenticed to a surgeon, without means to complete his professional studies, lingering hopelessly about his native place, he at last resolved to cast himself upon the wide ocean of London, and tempt the fearful dangers that belong to the career of a literary adventurer. Here he struggled and starved for a year. During the first three months of his London life, he sent manuscript poems to the booksellers, Dodsley and Becket, which they civilly declined. He addressed verses to Lord Chancellor Thurlow, who informed him that his avocations did not leave him leisure to read verses. He sold his clothes and his books, and pawned his watch and his surgical instruments. His one coat was torn, and he mended it himself. He was at last reduced to eighteen pence, but the brave man never despaired. He had a strong sense of religion, and he was deeply attached to one who became his wife after thirteen years of untiring constancy. His faith and his love held him up, and kept him out of degradation.

At last he wrote a letter to Edmund Burke. It contained this passage:—"In April last I came to London, with three pounds, and flattered myself this would be sufficient to supply me with the common necessaries of life till my abilities should procure me more; of these I had the highest opinion, and a poetical vanity contributed to my delusion." Burke saved Crabbe from the fate of many a one who perished in those days when patronage was dying out; and the various resources for the literary laborer that belong to the extension of reading had begun to exist. Burke persuaded Dodsley to publish the "The Library;" and the Bishop of Norwich to obtain its author, without a degree. His lot in life was fixed—Thurlow invited him to dinner, and telling him he was "as like Parson Adams as twelve to a dozen," gave him two small livings. He published "The *Village*" in 1773, and the "Newspaper" in 1785. From that time to 1807, the world had forgotten that a real poet, of very original talents, had appeared, for a short season, and was no more heard of. When Crabbe was fifty-three years of age he again published a poem. This was "The Parish Register." "The Borough" speedily followed. His "Tales" were in the same vein. Their success was triumphant. The author, whose worldly possessions were reduced to 8d in 1780, sold the copyright of his poems, 1817, to Mr. Murray, for £3000.

ROMANCE OF A COAL FIELD.

The following singular circumstance happened a few years ago in Parr, about 13 miles from Liverpool, where there are several extensive collieries. It will tend to show the immense value of coal mines which lie under a small superficial extent of land. An elderly widow lady sold to a gentleman some property in Parr, consisting of a house and about 30 acres of land, for £3,000. The old lady tho't there must be coals under the land, as there was so much in the neighborhood; but it was the decided opinion of coal proprietors, and others conversant with coal mines, that there were no coals on the property. The seller of the property, however, insisted that the coals should be reserved, unless the purchaser would give her £100 for them. This he refused doing, and the coals were accordingly excepted from his purchase, and reserved to her. The old lady died soon after, bequeathing the coals to the children of a deceased sister, seven in number, who were all laborers, and the residue of her property, worth about £3,000, to the children of another sister. The bequest of the coal mines was considered a nominal thing, and led to dissensions in the two families on account of it. The coal legatees brooded for a length of time over their disappointment, in not sharing their aunt's property with their cousins, but at length they contrived to induce some persons, who were supposed to have more money than wit, to undertake the expense of boring on the land to ascertain whether there were coals or not. The boring continued for a considerable time, to the great amusement of persons connected with the collieries; but at last, to their great astonishment, the chagrin of the purchaser, and the unbounded delight of the legatees, two delfs of the best coal in Lancashire were discovered, extending nearly the whole breadth of the land, and which could be easily worked. These coals were immediately purchased by the proprietors of a neighboring colliery for £20,000. On subsequent boring, three lower delfs were found, which the same parties purchased for £15,000.

A renowned philosopher of antiquity told his disciples, that when they should have acquired constancy enough to bear those who injured them with the same tranquility as they did those who treated them civilly, they might believe they had made some progress in virtue.

The talent of turning men into ridicule, and exposing to laughter those one converses with, is the gratification of little minds and ungenerous tempers. A young man with this cast of mind, cuts himself off from all manner of improvement.

The qualities of your friends will be those of your enemies; cold friends, cold enemies; half friends, half enemies; fervid enemies, warm friends.—*Lavater.*

Sunday Reading.

[Written for Moore's Rural New-Yorker.]

LINES WRITTEN IN A SISTER'S BIBLE.

BY MRS. M. WEBSTER DUNCOTT.

Sister, 'mid the ills of life,
When the clouds of sorrow lower,
When thy path with thorns is rife,
In affliction's trying hour,
May this holy volume be
Blessed comforter to thee.

When temptation's snares are spread,
And thy feet are prone to stray,
When mortal counsel fails to shed
Light upon thy darkened way,
May'st thou turn to this, and find
Guidance for thy troubled mind.

[Translated from the German for the Rural New-Yorker.]

THE TWO ANGELS.

Little Carl lay dangerously ill. The night-lamp burned upon the table, but the fever of the boy burned more fiercely. On his cheeks were implanted dark red roses, his lips were parched with thirst, and his eyes had lost their gleeful lustre.

Beside the bed knelt his mother. Three days and nights she had been silently praying and weeping, and now for the first time, slumber had stolen upon her wearied brow, and laid her head upon the pillow before which she knelt.

The day before, the physician said that little Carl must soon close his eyes, and see his mother no more. Now, Carl was a gentle and pious child, and with folded hands prayed: "Abba, dear Father, let me not yet die!"—Upon his bed lay a picture—the present of his lately deceased father. It was the picture of the child itself, in attitude of prayer, and below was written:

"Abba, dear Father,
Oh, make me good and virtuous bright,
That I may be an angel while."

On the right and left of the picture stood a pair of lovely angels, whom Carl always took delight in beholding, and his mother had to promise him that he would also be like one of these angels. His dim eye rested on them as he prayed his "Abba, dear;" he loved them so well, and would have been content to die if he could only take them and his "dear Mamma" along with him.

The flame in the dying lamp stood quivering, now leaping off, now returning to its socket, as if loth to leave it,—true image of the soul of man. This night it seemed to say, "Dear Carl, shall we not fall asleep together?" The unsteady flame at length expired, but the picture upon Carl's bed grew suddenly bright with marvelous splendor, and from the adorned borders out stepped the two angels like corporeal beings. They seemed to grow larger and larger, their apparel shone like thousands of softly glittering stars, and their eyes were of celestial brilliancy. They placed themselves beside the bed of Carl, and looked on him with such a friendly look as only angels have. At first the pale child trembled, but he soon recognized his beloved, and stroked their cheeks. "Must I, indeed, die?" he asked; "will you take me to Heaven? Yes, let me go with you; but let me take dear Mamma with me, for without her I cannot be happy in your home."

"No, thou shalt not yet die," answered one of the angels; "but on some future day we shall see thee again, then thou shalt go with us."

Thereupon the two angels rose and ascended a golden ladder, which carried them up high as upon the golden rays of the sun. With mournful look Carl saw them disappear above the clouds. But the clouds parted again, and the angels returned, bringing a beautiful book, such as Carl had never seen before. This they gave to him, and said: "Thy Father in Heaven sendeth thee this book; there are great truths in it; these thou shalt proclaim to thy fellow creatures, both on this and on that side of the sea, in countries far and wide.—That thou mayst do these things, thou shalt live."

"Oh! the beautiful, excellent book!" cried Carl, and pressed it to his heart. But the angels kissed his brow,—"We shall see thee again at some future day," they said, and departed.

* * * * * * *

Many years had passed away, when a man lay upon his death-bed, far away in China. His hair had not yet turned white, his strength was great, and his word all-powerful. He had wandered thousands of miles to proclaim the word of God among the heathen. He had endured great fatigue, and undergone many hardships, but he had brought many thousands to the worship of the true and only living God. This was his consolation in his dying hours. No father, no mother, no wife, no children, stood around him to weep. But he was happy, for he was about to return to his Heavenly Father.

As the evening approached he prayed once more, for his eye was already declining with the setting sun. On a sudden the room brightened as from the lustre of the noon-day sun. Once more he opened his eyes, and lo! there stood the angels of his infancy. "Forty summers have passed," said they, "since we saw thee last. At that time we promised to see thee again; and we have come now to take thee to our home, for thou hast done enough. Thou shalt rest, and appear before Him whom thou hast made known on earth." And the angels laid their hands upon his eyes, and the Holy Book upon his heart. His body they left to rest on earth, but his soul they carried up to the land of joy and bliss.

[The people of this earth called him Carl Gutslaff, but in Heaven he is known as one of the most faithful sons of God.] S. T.

Miscellaneous.

"LITTLE WILLIE."

BY REV. E. W. JONES.

"Little Willie" slumbers sweetly
In his lonely, narrow bed;
Pelting storms and howling tempests
Can not reach his little head.
Sweet affection drops a tear
O'er the spot where "Willie" lies;
Angels whisper, "look up yonder,"
Pointing upward to the skies.

On our mem'ries deeply graved
Stands his little image fair;
Sparkling eyes and shining tresses,
Rosy cheeks and golden hair;
Ruby lips so full of smiling,
Neck and arms of spotless white;
Little feet so full of running—
"Little Willie" was so bright.

Put away his little playthings—
Yonder lies his little whip;
On the table lies his whistle—
Oft he press'd it to his lip,
In the hall his little "pony"
Wonders why he stays away;
By its side you see his wagon—
There his little shaggy "Tray."

On the window lies his primer;
Lo the chair on which he sat!
On the wall in yonder corner
Hangs alone his little hat.
O remove these sad memorials!
Lay them carefully away;
Christ, be thou our consolation,
In the dark and gloomy day!

"Little Willie" slumbers sweetly
In his lonely, narrow bed,
Pelting storms and howling tempests
Can not reach his little head.
On that bright and glorious morning,
Christ will whisper from above,
"Rise, my child, and let me dress thee
In robes of white and spotless love."

(For the Rural New-Yorker.)

RURAL RAMBLES AND REVERIES.

JUNE—laughing, joyful June—is here, with her roses and her clover-fields—her brightest bloom and sweetest fragrance. Earth never wears a gayer robe than that decked by the fairy fingers of June—"Summer's first and fairest child"—she never boasts of more beauteous gems or richer embroidery for her adornment. And for an hour "I throw myself on the bosom of Nature, as on the heart of my dearest friend. I see her lovely face, and listen to her friendly voice; and none but Him who speaks through Nature, can ever know what heavenly things she whispers in my ears, this happy Summer's day." I can only *try* to tell of the scenes among which I move, and of the thoughts which move me, in the fields and about the woods, this quiet afternoon.

It is a quiet afternoon. The sun is sending down his ardent glances upon the verdant fields, the air seems all aglow with his beams, and as you look you seem to see the simmering heat between you and some hill or tree, not far away. But not alone do you *see the heat*, you also *see the coolness*. Here and there, floating across the sky, are light fleecy clouds,

"Mole wanderers through the ambient air,"

which intercept the radiant glow, and give a few moments of refreshing to both laborer and loiterer. How beautiful you lustrous cloudlet, "with folds so soft and fair!"—it seems like many an other bright creation, indeed, "too beautiful to last." And, it is now dissolving—changing its form—and, assuming one still more magnificent, anon it fades from the sky. Thus often thus, but more often in darkness and gloom, pass away our fairest hopes, our dearest joys, and our brightest visions of happiness.

Beautiful in all the freshness and fragrance of June, is the forest to-day. Sweet the song of bird, the chirp of cricket, and the hum of the ever busy bee. The soft, deep undertone of the gentle breeze which strays among the young leaves, leaving the gnarled limbs unstirred, hushes the soul into unison with the feeling of quiet around. You have read—but you will read with a new sense of their meaning here—those noble lines of BRYANT:

"The groves were God's first temples,—Ere man learned
To hew the shaft and lay the architrave,
And spread the roof above them,—ere he framed
The lofty vault together, and rolled back
The sound of anthems—in the darkling wood,
Amid the cool and silence he knelt down
And offered to the Mightiest solemn thanks
And supplication. For his simple heart
Might not resist the sacred influences,
That—from the silly twilight of the place,
And from the gray old trunks that high in heaven
Mingled their mossy boughs, and from the sound
Of the invisible breath that swayed at once
All their green tops—stole over him and bowed
His spirit with the thought of boundless power
And inaccessible majesty."

Think these thoughts, and we may wisely drop the theme, meditate, bowed in spirit by the sacred influences of this hallowed "first temple," and you will be happier for days thereafter.

We spoke of the hum of the bee. You need not look far to find him—there he is, paying his respects to a beautiful wild aster, with most delicate white leaves and a pale yellow centre. Notice well the flower and its simple but exquisite loveliness. It is seldom found save in the edge of the forest—lifting its slender stem and waving its thread-like petals in the lightest zephyr. And there is no flower or leaf unworthy of examination by the lover of beauty, or the seeker after wisdom. COLERIDGE expressively remarks:—"The wonderful works of God in the sensible world, are a perpetual discourse, reminding me of His existence, and shadowing out to me His perfections." What can more worthily occupy our reveries?

Now away to the crystal spring, which gushes cool and sparkling from the earth, bubbling over up in its pebble-paved basin—brimmed with verdant moss, and shaded by a clump of wild rose bushes. What can we imagine more delicious? The clouds look down to see their shadowy forms reflected there still more shadowy; and the gleaming stars see sister stars rest in its bosom in the silent hours of the hushed and holy night.

This were no Rural ramble, or at best an incomplete one, unless the birds,

"Creatures that links do seem 'twixt earth and sky,"

were flitting through them. May we not tell of the Oriole, or hang-bird, with his flame-colored wings, which glance like a torch-light among the scattered trees? Of the blue-bird, which occupies a hollow stump in the latest clearing, for a dwelling place, and "pays his rent" in music? And of the ground-bird, whose little nest, with all its young, we can only save from the plow now in motion, by removing it? We do it gently, little sparrow—"gently as though we loved you,"—so blame us not. And the mock-bird;—he loves to hide in the thicket and pour out his garrulous and changeful song. O, many are the birds which sing for us—many are the scenes which gladden us—but "our time is up." And then, do our RURAL readers need our poor reminders of the joys of the God-made country? J. H. D.

THE PHASES OF LIFE.

MOURNFUL indeed, are those breakings up which sever us so widely from each other, and send us forth by separate paths into the great highway of life, to struggle for a living and a grave. How much would the labors of life be lightened, and how would its darkest cloud be bordered by a golden fringe, if the dear and loved ones who start with us in the beginning of the race might battle by our side, till we have reached its goal! But in time, they come not back again to refresh us with their presence and to cheer us on in the battle and the strife. Apart we breast the foaming billows—together we sink into the grave. And tho' with the German poet we cry in our soul's sore anguish, "Come back again, bright youth," yet for us it will not return. O! for one more glimpse of the blue sky as we beheld it then, when we thought it heaven, and while we looked upon it as the jeweled canopy of this world, believed it to be the starry pavement of another. The old wood still lies black and grim round the old house as it lay then; but we do not fear its deep glens and its dark hollows now. There are no ghosts and no fairies there any more. We have grown prosaic now, and the beautiful idealism of our youth has spread its sheeny wings and flown away to gladden other hearts, on which still rests the dew of the morning, and in which the hot siroccos of the world have not yet withered the one green oasis! We have each of us desired in some moments of our life, to be once more a child. It is the season of dreams, and day visions, and fictions. We have not as yet come into contact with the iron realities of life. There is, too, such an implicit faith and wonderment in childhood. How reverently we believe the remarkable stories and wonderful adventures of Jack and the Beanstalk; Sinbad the Sailor; and Little Cinderella, with her Little Glass Slipper. What tears we shed over the "Babes in the Wood," and how we loved the "Robins" for covering their little bodies up so decently with the brown, withered leaves of Autumn.—How eagerly we gathered round the winter's hearth to listen to the wonderful tales of the Arabian Nights, and revelled in the gnomes, the genii, the gem-lit caverns, the blazing cities, and the subterraneous kingdoms of oriental fiction. Alas! these are all memories now. Precious, golden memories, indeed, are they; and their subdued and mellow lustre comes streaming over and anon down the toil-some ways of life, and seems, for a time, like moon-light on a rugged landscape, to soften down all that is uneven and inharmonious.

GROWTH OF AMERICA IN WEALTH.

THE number of houses in the United States, by census, is 3,363,127, and free families, 3,598,240, or nearly one for each family. If the dwellings increase in the proportion of the population, then the number of houses built in the last six years is 663,000; at an average of $1,000 each, this would give $663,000,000, or $700,000,000 with furniture. The tonnage of shipping built has been 1,921,439, worth, at an average of $60 per ton, $115,286,340.—The value of railroads, $287,400,000; new bank capital, $65,000,000. These items alone make the following aggregate:

Houses built, 1848 to 1854,	700,000,000
Shipping,	115,286,340
Railroads,	287,100,000
Banks,	65,000,000
	$1,167,186,340

In addition to this are the vast sums for factories, improvements, insurance companies, mines, etc., etc., and these outstanding investments have been made without any perceptible increase in the amount of stocks held abroad.—*U. S. Economist.*

A MAN must first govern himself, ere he be fit to govern a family, ere he be fit to bear the government of the commonwealth.—*Sir Walter Raleigh.*

OPEN your mouth and purse cautiously, and your stock of wealth and reputation shall, at least in repute, be great.—*Zimmerman.*

NEBRASKA.

THE boundary of this proposed Territory is spacious enough and contains much very excellent land—the Missouri bounds it on the East, and the Rocky Mountains on the West. There is quite a number of good useful streams that traverse its borders.

It is now confidently expected that the Indians will be removed this fall to their new homes, giving room to the ever-pursuing pale faces.

The climate, like our own, is mild and pleasant, and like all other prairie countries, there is a rather freer proportion of wind, and even in the most sultry summer days a cooling breeze fans the prairies. There is a little snow in winter, it being much of the time pleasant, sunny weather through the winter. The vast herds of buffalo, elk and deer, that range this extensive territory would feed the starving millions of Europe on meat for years.

The valleys on all the streams are rich and fertile, but much of the high lands away from the water courses are sandy and not arable.—There are minerals of various kinds already discovered, among which are coal, iron, chalk, magnesia, &c. There is timber on nearly all the streams intermingled with the bluffs and hills and valleys, although as a general thing there is a scarcity through the Territory.

Fish, geese, swan, ducks and other feathered game, is abundant through this whole Missouri river region. Amongst the fruits that abound in Nebraska and in this region also, are grapes, plums, cherries, strawberries, black currants, gooseberries, haws, crab and thorn apples, and in the mountains of Nebraska the same berries abound.

The Missouri bottoms in Nebraska are in many places broad and always fertile, with timber its whole length. Omaha city is the name in embryo of a city to be built on the river opposite this city. The location and natural advantages are not to be excelled.—The site of Winter Quarters, 12 miles above, is also beautifully and romantically situated for a large place. Belleview, 13 miles below, is equally an eligible site in many respects, and has an excellent ledge of rock on the margin of the river. Nebraska Centre, or Wood River settlement, has already been commenced, and a post office established. This is distant, west 150 miles, and near the Platte river. There are already five post offices established in Nebraska on the north side of the Platte, as is the case with Western Iowa; this new Territory will be filled soon after being opened, with hardy, industrious people from the East, who will make her hills and dales resound with the song of the laborer or click of the mechanic's tools.

AMERICAN CHARACTER.

FREDRIKA BREMER, in her "Homes of the New World," says:

The ideal of the man of America seems to me to be, purity of intention, decision in will, energy in action, simplicity and gentleness in manner and demeanor. Hence it is that there is something tender and chivalric in his behavior to woman which is infinitely becoming to him. In every woman he respects his own mother.

The American ideal of happiness seems to me to be, marriage and home, combined with public activity. To have a wife, his own house and home, his own piece of land; to take care of these, and to beautify them, at the same time doing some good to the State or to the city—this seems to me to be the object of human life with most men; a journey to Europe to see perfected cities, and ruins, belonging to it as a desirable episode.

Of the American home I have seen enough and heard enough for me to be able to say that the women have, in general, all the rule there which they wish to have. Woman is the centre and the lawgiver in the homes of the New World, and the American man loves that it should be so. He wishes that his wife should have her own will at home, and he loves to obey it. In proof of this, I have heard the words of a young man quoted:—"I hope that my wife will have her own will in the house, and if she has not, I'll make her have it!" I must however say, that in the happy homes in which I lived, I saw the wife equally careful to guide herself by the wishes of her husband as he was to indulge her. Affection and sound reason make all things equal.

A TREASURE, COSTING NO MONEY.—Which will you do—smile, and make your household happy, or be crabbed, and make all those young ones gloomy, and the elder ones miserable? The amount of happiness you can produce is incalculable, if you but show a smiling face, a kind heart, and speak pleasant words.—Wear a pleasant countenance; let joy beam in your eyes, and love glow on your forehead.—There is no joy like that which springs from a kind act or a pleasant deed; and you will feel it at night when you rest, at morning when you rise, and through the day when about your business.

A smile—who will refuse a smile,
The sorrowing heart to cheer,
And turn to love the heart of guile,
And check the falling tear?
A pleasant smile for every face,
O, 'tis a blessed thing;
It will the lines of care erase,
And spots of beauty bring.

JUDGE NOT.—Who can unfold, even to his own heart, all the motives that influence and direct his conduct? Who can unravel the mysteries of his own will,—as well acquainted as he must be with its secret workings,—and say by what he was decided to this course or the other?—what called up that train of tho't, or broke it so suddenly for a different one?—Yet how much easier it is than to give correct judgemnt of what dwells in our neighbor's heart! blind as we must be to its hidden impulses, dark as ever are to mortal eyes the consequences which are to follow.

GREAT works are executed, not by force, but by perseverance.—*Gregory.*

STANZAS.

BY HORACE S. HUMPHREY.

I ask not for wealth's gilded baubles,
I sigh not for fame's giddy height,
Which roars not above the world's troubles,
Where shines not affection's pure light.
I crave not the warrior's vain glory,—
Hands dyed in humanity's blood;
Oh! twine not my brow with his laurels,
He only is great who is good.

But I ask for the blessings of friendship,
A home in a kind, loving heart,
One to share with me all of life's pleasures,
And to bear of its sorrows a part.
Oh! give me a home in the country,
Where breezes blow fresh o'er the lea,
Come laden with health and with fragrance,
Where the spirits are buoyant and free.

Where the rose and the lily are blending,
And mantle with beauty the cheek;
Where dwelleth the Goddess—Hygeia,
Whose smiles of true happiness speak.
Where May spreads her emerald carpet,
In beauty, o'er hill and o'er lawn,
And gems it with sweetest wild-flowers,
That sparkle with dew at the dawn.

Where bountiful harvests are waving
Golden plumes in the Summer's glad prime,
And Autumn, with luscious fruit laden,
Displayeth rich colors, sublime.
Where crystal streams, through the green meadows,
Are murmuring forth a gay song;
For this landscape, a back ground of mountains,
Clouds floating their summits along.

Far away from the world's ceaseless turmoil,
Where quiet, contentment, are found,
Let dwell among kindred and neighbors,
Where the heart is with happiness crowned,
Where abideth the beautiful river,
Unfolding new charms day by day,
With a gallery free to the million,
Whose paintings all richness display.

Oh! give me a home in the country,
A cot in the midst of a bower;
Where songsters on each sunny morning,
Oh! music pour forth a sweet shower;
Choice books to peruse at my leisure,
With kind ones to listen the while;
Oh! what could add more to life's pleasures,
How better its sorrows beguile?

With these would my life like a river,
Which serenely flows down through the vale,
Glide on to eternity's ocean,
Ne'roughed by adversity's gale;
The smiles of true love and affection,
Like oil to the foam-crested deep,
Would quiet the trouble-tossed waters,
And lapse them again into sleep.

Elmira Water-Cure, June, 1854.

(Written for the Rural New-Yorker.)

A GOOD HUSBAND.

HAVING seen in many books and papers articles headed "A Good Wife," I conclude there is no one left who *can* write, to give us the description of a model husband; indeed I believe it a hard subject, but for once will see what I can do, if I can find a criterion.

We are taught that domestic rule must be founded upon truth and love. If it have not both of these, it is nothing better than a despotism. Now, admitting what all the "lords of creation" claim, that man is superior to woman, he should learn the disposition of his wife, as a teacher does that of his pupil, and teach *her* to understand *his*; in so doing both husband and wife will be prepared to administer to each other's tastes and wants. In order to do this, he must sympathize with her; for upon his sympathy will depend her truthfulness. Ah! how often do we hear in the half-suppressed sigh, the complaint that they are not confided in. It does not need want or guilt to break a wife's heart;—the absence of content,—the mutterings of spleen,—the carelessness of dress, the forbidding scowl, and the deserted hearth; these and other nameless neglects without a crime among them, have harrowed the soul of many a wife, and planted there, beyond the reach of remedy, the germ of dark despair. Man cannot expect to meet a smile or welcome from such an injured one; no, it is not in nature,—though she may be taught that woman was designed by the All-Wise to smother all her own wants, to live alone for the husband, and administer to all his wishes,—to feel cheerful when he does, and when he is sad, endeavor to raise his drooping spirits, by the most careful attentions,—always speaking "soft words to turn away his wrath," keeping her griefs and pains locked up within her own bosom, through fear of giving him pain,—remembering the adage "that love bears no load," goes on in cheerfulness,—enough for her to know that she pleases her husband *sometimes*, (for such exacting selfishness cannot always be satisfied.)

Oh! may man, before his home is blighted, his own temper soured, his wife made wretched, *remember* that woman is not only human like himself, with all the feelings and sensibilities incident thereto, but that hers are even more tender and sensitive than his! She, too, feels the natural ills of life, and admits herself inferior to him in nerve and physical strength; therefore she looks up to him confidingly, and ought, if she does not, to find in him not only a sympathizing companion, but a protector;—she then, as well as he, would keep alive and dwell upon the recollections of youth, that tuneful time when all those happy promises were made,—a happy and playful allusion to that hour of joy and love—a kiss of peace to pardon all the past,—will bid her live, as she had hoped, in matchless bliss—loved, loving and content—the soother then in earnest of the sorrowing hour. VIANA.

A PERFECT WIFE.

EDMUND BURKE, the distinguished orator, presented to his wife on the anniversary of their marriage, his idea of a "perfect wife," which is supposed to be a true portrait of Mrs. Burke. It is certainly a lovely picture, worthy of the pen of the author of "The Essays of the Sublime and Beautiful." The following are the extracts:

"Character of——.

She is handsome, but it is beauty not arising from the features, from complexion, or from shape. She has all three in a high degree, but it is not by these that she touches a heart; it is all that sweetness of temper, benevolence, innocence, and sensibility, which a face can express, that forms her beauty. She has a face that just raises your attention at first sight; it grows on you every moment, and you wonder it did not more than raise your attention at first.

Her eyes have a mild light, but they awe when she pleases; they command, like a good man out of office, not by authority but by virtue.

Her stature is not tall, she is not made to be the admiration of every one, but the happiness of one.

She has all the firmness that does not exclude delicacy—she has all the softness that does not imply weakness.

Her voice is soft, low music, not formed to rule in public assemblies, but charm those who can distinguish a company from a crowd; it has its advantage—you must come close to her to hear it.

To describe her body, describe her mind:—one is the transcript of the other; her understanding is not in the variety of matter it exerts itself on, but the goodness of the choice she makes.

She does not display it so much in saying or doing striking things, as in avoiding such as she ought not to say or do.

No person of so few years can know the world better; no person was ever less corrupted by the knowledge.

Her politeness flows rather from a natural disposition to oblige, than from any rules on that subject, and therefore, never fails to strike those who understand good breeding, and those who do not.

She is of a steady and firm mind, which takes no more from the solidity of the female character than the solidity of marble does from its polish and lustre. She has such virtues as make us value the truly great of our own sex. She has all the winning graces that make us love even the faults we see in the weak and beautiful in her."

FLOWERS AND MUSIC.

YES, two gifts God has bestowed upon us, that have in themselves no guilty trait, and show an essential divineness. Music is one of these, which seems as if it were never born of earth, but lingers with us from the gates of heaven; music, which breathes over the gross, or sad, or doubting heart, inspires it with a consciousness of its affinities, and touches the chords of its unsuspected, undeveloped life.—The other gift is that of Flowers,—which, though born of earth, we may well believe, if any thing of earthly soil grows in the higher realm,—if any of its methods are continued, if any of its forms are identical,—they will live on the banks of the River of Life. Flowers! that in our gladness and in our sorrow are ever incongruous—always appropriate. Appropriate in the church, as expressive of its purest and most social themes, and blending their sweetness with the incense of prayer. Appropriate in the joy of the marriage hour, in the loneliness of the sick room, and crowning with prophecy the foreheads of the dead. They give completeness to the associations of childhood, and are appropriate even by the side of old age, strangely as their freshness contrasts with wrinkles and gray hairs; for still they are suggestive, they are symbolical of the soul's perpetual youth, the inward blossom of immortality, the amaranth crown. In their presence we feel that the body shall go forth as a winged seed.

A MOTHER'S INFLUENCE.

IN ENGLAND, some years ago, a man presented himself before a body of clergymen to be examined, that he might be licensed to preach the gospel. His advantages for study had not been very great, and he had many fears that he could not sustain himself, and answer the numerous questions which would be proposed. With a trembling heart he stood up before his fathers and brethren, and one of them asked him with whom he had studied divinity.

The young man was somewhat confused at this question, for he knew very well that he had not enjoyed the instruction of any distinguished divine; and he replied with hesitation, "My mother taught me the Scriptures."

"Ah!" said the minister who had asked the question, "mothers can do great things!"

The examination then proceeded, and the result was delightful proof that mothers may be good teachers of theology; that the truths implanted by their early instructions, watered by their pious tears, and sanctified in answer to their prayers, will bear precious fruit after many days.

This candidate for the ministry was found to be mighty in the Scriptures, and most gladly was he commissioned to go forth and preach the word to his fellow-men.

THE criterion of true beauty is, that it increases on examination; if false, that it lessens. There is something, therefore, in true beauty that corresponds with right reason, and is not merely the creation of fancy.—*Lord Greenville.*

MOORE'S RURAL NEW-YORKER

ROCHESTER, JUNE 24, 1854.

Our Next Half Volume.

The second half of our present volume will commence on Saturday, July 8. Those whose subscriptions expire next week, will bear in mind that a prompt renewal is necessary to secure the regular continuance of the Rural, as we adhere strictly to the cash system in its publication. And in renewing their subscriptions, we trust our friends will not "forget to remember" that the names of as many of their acquaintances as may be conveniently obtained, will prove acceptable. Though we have been favored with an unexpectedly large increase of subscribers during the past six months, our books are not yet full, and we shall not object to additions to any reasonable extent.

A Contemporary Disturbed!

Some weeks ago we published a brief article from a correspondent residing in an adjoining county, commenting upon an editorial of Dr. D. Lee in the *Southern Cultivator*. Since then two of our city daily journals have severely criticised the Doctor's diatribe on "Hireling Labor and Slave Labor"—placing him in no enviable light before community. In responding through his *political* organ, the *Daily American*, Dr. Lee (without quoting our correspondent's article,) accuses us of "falsehood, to *injure* the *Farmer*!" Now, considering the comparative circulation of the Rural and *Farmer* in Western New York—the former being probably at least *three times* that of the latter—our northern neighbor, with *very* southern principles, arrives at a "most lame and impotent conclusion." Why, bless your sympathy-seeking soul, dear Doctor, we have no occasion to *injure* the *Farmer*—not the least in the world. *You* have already done that so effectually that no foreign aid is required,—and we don't believe in *superfluous* labor, either slave or hireling. Instead of wishing injury to the *Farmer*, we regret that a journal which enjoyed a large circulation and influence only a few years ago (when we retired from it, if you please, Doctor!) should rank so low as it now does in both these essential particulars!

Yes, amiable Doctor, when you assert that "Mr. Moore resorts to falsehood to injure the *Farmer*," you utter a lie as foolish as it is ridiculous. Our correspondent, though a plain farmer—one subjected to "hireling labor," if you please—quoted from you correctly, and expressed, in his comments, the opinions of an intelligent plowman of Western New York. And though he may be "a tyro at the business" of criticism, it seems you have not the manliness to quote, or ability to refute, his article.

—We may, and may not, hereafter copy the Doctor's southern article, but hardly think it would pay,—for, like all his essays to sustain a bad cause, and tickle the fancy of the readers of his *southern* journal, it is wearisome, and not "calculated for this meridian." Dr. Lee well knows that we have studiously avoided any attempt to injure his journal. Believing that there was room enough for all, we never alluded to him disparagingly, until he "threw the first stone"—and though he may accuse us of falsehood, and start the foolish pretence that we wish to injure the *Farmer*, our equanimity will not be greatly disturbed by such puerile demonstrations.

Cholera.—The Cholera has made its appearance at the East, the West, and the South; but as yet no cases have occurred in any of the cities of Western New York. This epidemic has made fearful ravages in these localities heretofore, and unless guarded against, may do so again the present season. The surest preventive against Cholera, is sobriety of conduct, regularity of habits, cleanliness of person, and perfect ventilation, and freedom from filth in cellars and out-buildings. The sanitary measures which suggest themselves to every man of sense and prudence, are called for at this season of the year, epidemic or no epidemic, and will do much to abate, not only cholera, but fevers, bilious diseases, and a thousand other ills that flesh is heir to, and save many a Doctor's bill, and the swallowing of bitter pills and boluses. An ounce of prevention is better than a pound of cure.

The Pacific Railroad.—Col. Fremont has written a long letter to the editors of the *National Intelligencer*, describing his winter exploration of the Central Pacific Railroad route. Up to the 23d of January, during the exploration as far as the Utah Valley, only a few inches of snow were found, but on attempting to cross the Sierra Nevada, at an elevation of 8,000 or 9,000 feet, the snow was impassable, and he therefore took a detour to the southward, and flanked the Sierra, passing through valleys of easy grade and mild climate. He is confident of the practicability of that route for the passage of railroad trains at all seasons of the year, and insists that the legitimate line for the great thoroughfare lies in the course pursued by him.

Horticultural Exhibition.—The Horticultural Society of the Genesee Valley, will hold its June Exhibition of Roses, Strawberries, &c., at Corinthian Hall, Rochester, on Saturday, the 24th inst. A fine show is anticipated.

Opening of Japan.

The American exploring expedition under Commodore Perry's command, has achieved a great triumph in opening to American commerce the Empire of Japan. The exclusiveness of that mysterious people is fairly broken up before the formidable array of the squadron's guns, although the use of them was not called for, except as backers to friendly negotiation.

Heretofore great cruelty has been shown to unfortunate mariners who have been shipwrecked upon Japanese shores. They were confined in wooden cages, like wild beasts; transported from one portion of the kingdom to another, and subjected to great indignities and hardships, sometimes being kept imprisoned for years, before allowed to pass out of the kingdom. This injustice is now abated, and shipwrecked mariners are hereafter to be treated kindly, and allowed every facility for returning to their own country. The United States are to be allowed to establish coal depots, for steamers, at various points, and to be permitted to trade with the people. The two former are undoubtedly the most important concessions, at least for the present, as commercial intercourse will not probably be very great for some time to come.

A Hong Kong correspondent of the N. Y. *Commercial Advertiser* enumerates the following articles as likely to be most in demand for Japan: Woolens of every description; preferable colors, red, blue, and yellow. Hardware, including tools of all kinds, tin plates, stoves, Glassware, window, plate, and cut. Printed cotton of fine texture and high colors; carpeting; heavy cotton goods; fire-arms; clocks; leather of bright colors, &c.

From the Japanese we can procure silver, gold and copper of unusual purity; tea and silk—the latter, however, of an inferior quality.

Western Emigration.—Accounts from the western cities are filled with statements referring to the immense tide of emigration setting in that direction during the present summer, not only for settlement in the older Western States, but also for the selection of new lands in regions heretofore beyond the pale of civization. The profound excitement produced throughout the Union by the Nebraska question, has tended more to turn the attention of settlers in that direction, than all the patronage of the government could possibly do; and the motive for emigrants, both American and foreign, in going thither, is both patriotic and philanthropic. But in settling Nebraska speedily, the more southern territory seems to be partially lost sight of, and an opening left in Kansas for the introduction and establishment of slaves. That territory is really the point of danger, and friends of free soil should bear in mind, that if they take care of Kansas, Nebraska will take care of itself.

The Musical Congress.

[From our Albany Correspondent.]

New York, June 16, 1854.

As intimated in my last, I visited Gotham, to be present at the Musical Congress; and I may say, that as far as those who could hear were concerned, it was a paying operation. Whether Barnum came out as well or not, is beyond my province to tell. The true idea and intent of such a gathering, should be to give a fit interpretation to the musical works of the great masters. It is to bring together large numbers of trained vocalists and instrumental performers, who shall, in their execution of pieces, exemplify the true meaning of grandeur and sublimity, as well as beauty, in art. A solo singer, or a quartette, may fully represent the beautiful in music, as a single flower or a sparkling dewdrop may in nature. But as the extended landscape, the broad prairie, the mighty ocean, or the awful Niagara are required for natural sublimity or grandeur, so in music, numbers are essential, and a combination of all classes of performers must be effected, if the result is to be grand or sublime.

Let the Musical Congress be examined in this light. In the first place, the building should be considered, and it must be obvious, that so far as this is concerned, it comes up to the standard, with the exception that it may not be constructed to give the best effect to musical sound. The arrangements inside were well planned.—The stage for the performers occupied the east nave, commencing near the center of the building. The seats rose one above the other, with about 18-inch risers, to several feet above the galleries. The cost of this alone, must have been at least one thousand dollars.

This brings us to the next item, that of numbers. The combined forces amounted to about 1,000, and not 1,500, as advertised. Of these, about 800 were vocal and 200 instrumental.—The vocalists were from New York and Boston, principally, and sustained their parts with marked power and precision. The instrumental performers consisted of Jullien's Celebrated Concert Band, the Germania Band, Dodworth's Brass Band, the United States Military Band, and a large collection of foreign and native professional and amateur artists from various places. These were happily balanced, and their positions well chosen. The sight of this vast army of persons and instruments upon the stage before mentioned, was truly imposing. I think it must be conceded, that in all the respects mentioned, the Musical Congress was *not* a humbug.

As to the character of the music performed, I may remark, that all the choruses, overtures and symphonies were well worthy of a place on the programme, and their performance gave to all hearers a better appreciation than they had ever had of the truly majestic and sublime.—Having heard the mammoth choruses of Boston, I can compare without fear of contradiction, and this certainly exceeded all my previous experience. The Hallelujah chorus was most familiar to the people, and was, perhaps, on that account, best appreciated. Of the solo performances, I cannot speak in the least terms of praise. They were, in the first place, out of their true sphere, because the Palace is not adapted to anything of the kind; and secondly, the vocal pieces were not well performed, setting aside the place.

The most exciting instrumental piece was the Fireman's Quadrille, composed expressly for the occasion by M. Jullien; and as it will be repeated for many nights, a description will not be out of place. The design of the whole is to give a musical and artistic representation of a "Fire." The day selected is of a jubilant character, on which the firemen are all out in procession, with bands, badges and banners, and having a "great time." Their gathering and marching are portrayed by giving fragments of tunes as they would be heard by an observer on occasions of this kind. The music for these figures is very brilliant and exciting. The concerted pieces from brass bands, are intermingled with the ruder strains of the fife and drum.—Then the breaking-up of the procession is indicated, as the music of one band after another dies away in the distance, and all becomes perfectly calm and still. All this is represented by music, and the stillness is not unlike that realized after the celebrated "Storm Chorus" in Haydn's Seasons. Night approaches, and a dead silence ensues.

Suddenly the alarm is given. Engines rush to the scene, and the utmost excitement follows. The effect is enhanced by fires kindled about the upper part of the palace, which are plainly visible through the glass. The whole audience became so excited, that they all joined in the cry of "Fire," and a scene of noise and confusion ensued that is impossible to describe.—Finally the flames are extinguished, and the exhilarating strains of music proclaim the victory. Amidst these, a crash indicates the falling of the walls. This is caused by rolling a large number of cannon balls down an inclined plane of some forty feet in height, which fall among fragments of old iron. The whole thing is conceived admirably, and will continue to be immensely popular. It is adapted, in a superlative sense, to the American taste. No composer has seemed to hit us as well as Jullien, as his performances abundantly testify.

At the close of this piece, the calls for Barnum were vociferous, and he appeared with Jullien, and each tried to give the other the praise for the success of the enterprise. Jullien promised to do even better in future, and Barnum promised to repeat for 25 cents a night.—Though there were several pieces remaining unperformed, yet the spell was broken, and the vast audience rapidly retired. The number is variously estimated, but it is not safe to say more than 30,000, while it is morally certain that the number in the palace at one time must have considerably exceeded 20,000. Taken all in all, it was a splendid affair, though not properly repeated under the name of a "Musical Congress."

The programme of future Concerts held at the Palace, are further proof that the nature is to be changed. Without doubt, the performances will be good as instrumental entertainments, and well worth twenty-five cents; but it is deceitful and wicked to call it a Musical Congress any longer. "Owe."

Letter from Minnesota.

St. Paul, June 10, 1854.

Messrs. Editors:—The great excursion party has come and gone. A thousand guests of the Rock Island Railroad Company have viewed our magnificent scenery, received a hearty welcome to our shores, and returned home to let light and knowledge in a continuous stream upon Minnesota and her resources. The voice of the Press will tell a tale that will startle all America. Such a host of editors is sufficient to save or condemn with faint praise any community. If Minnesota does not this year increase in population fifty thousand, the calculations of this deponent will be sadly mistaken.

On Thursday evening a Grand Ball was given at the Capital in honor of the illustrious men present. An eloquent welcome was extended by Gov. Gorman, who dwelt in a graphic manner on the rise of the country—the administration of President Fillmore, and the power of the Press. Gov. Gorman is a man of great native strength of mind, and powerful invective. He is emphatically a Western man, with a large heart and honest purpose, well fitted to preside over the destinies of a rising Territory like this. Ex-President Fillmore, and the learned Historian, Bancroft, replied. Suffice it to say, that their speeches bore eloquent evidence of the grandeur of our scenery and resources, and the glorious future that awaits Minnesota. Such an assemblage of dignitaries has seldom met together.

The most fertile and valuable lands in Minnesota lay along the Minnesota River. Flourishing villages are rising all over it. Thousands of emigrants are flocking in to possess it. St. Peters is at the head of navigation on this River. It now has five hundred inhabitants and is rapidly growing. It will be the future Capital of Minnesota. The country which surrounds it, is the richest and most beautiful in the West. It will become a city—the largest in Minnesota. Let enterprise and industry come here and settle. A better chance for profitable investment cannot be found between the Oceans.

Yours, &c., W. M. H.

News Paragraphs.

☞ The construction of a carriage road to run from the Glen House to the summit of Mt. Washington, a distance of a little less than eight miles, is to be commenced immediately. The grade is only an average of one foot in eight.—There are various places where the road proceeds nearly on a level, so as to permit the horses to rest on the way. The steepest inclination is about one foot in five.

☞ The Hamilton, C. W., Spectator, speaks of the recently promulgated idea that the Canadas will not long hence become States of this Union, as "republican bluster," and intimates that in case those Provinces determine upon a change of their political relations, they will choose to set up for themselves, rather than to "become a mere dependency of the adjoining Republic."

☞ A letter from Naples states that on the 14th ult., M. J. Delius, of Bremen, having seconded Mt. Vesuvius with a party of his countrymen, went too near the edge of the crater, and the ground giving away under him, he fell into the abyss. His groans were heard from the bottom, but when some persons descended, by means of ropes, he was dead.

☞ Prince Paul, of Wurtemberg, brother of the King of that part of Germany, and first cousin of Queen Victoria, arrived in New York a day or two since, and stopped at the Metropolitan Hotel. The Prince is a great traveler, having visited all parts of the world. He has just taken a run through the Southern States of the Union.

☞ It is said that a German sculptor, residing in Athens, has discovered the quarries of those celebrated marbles, the red and green antique, which have been sought after in vain from time immemorial. He found the red antique on the southern part of the chain of the Taygetus, and the green on the northern side of the Island of Tinos.

☞ The recent discovery of copper ore in the island of Juan Fernandez, has caused quite a *metallic* fever at some of the western ports of South America. At last accounts, two parties had sailed from Valparaiso, in quest of a fortune in the quondam empire of Robinson Crusoe.

☞ The Empress of France is in the constant receipt of petitions, imploring her to exempt young men from the necessity of joining the army. Mothers seem to consider Her Majesty all powerful in this respect, but the lady Empress has determined not to interfere.

☞ Isham Williams, of Madison Co., came to his death last Monday, 29th inst., from being stung on the arm by a wasp. He died in less than ten minutes, after being stung. This is believed to be the first case on record of death being produced by such a cause.

☞ It is said that the use of the Crystal Palace on the 4th of July, has been tendered to the National Monument Association, and that the Hon. Wm. C. Rives, of Virginia, late Minister to France, is to be invited to deliver an address upon the occasion.

☞ Hon. Nathaniel Baker, Governor of the State of New Hampshire, has been unanimously re-nominated by the Democratic Convention. Resolutions were offered endorsing the Administration, the Nebraska bill, and the Baltimore platform.

☞ Gen. Cass has dropped the discussion with Bishop Hughes, and it has been taken up by Dr. Fuller, a distinguished Baptist preacher of Baltimore, the author of the first petition on the subject of religious freedom presented by Gen. Cass.

☞ It is said that the President has already received upward of three hundred applications for offices under the Nebraska and Kansas territorial bill, and that every mail adds to the number. There are fourteen officers at the President's disposal.

☞ Messrs. Cutler, Ashley and Jones, of Buffalo, have in charge, for transportation, an enormous bell, intended for an alarm tower in Cincinnati. It was cast by Meneeley & Co., of West Troy, and weighs six thousand pounds!

☞ A freight train from Buffalo for New York passed down the Central Railroad on Wednesday week, consisting of thirty-nine cars, having on board 590 head of cattle. They probably did not weigh less than 350 tons.

☞ Three great religious bodies hold their anniversaries next year in the west, viz:—New School General Assembly, at St. Louis; Old School General Assembly, at Nashville; Baptist Missionary Union, at Chicago.

☞ Rev. Henry Ward Beecher is to make a Fourth of July speech at Painesville, Ohio. Extensive arrangements are making to secure him the largest audience he ever addressed, and the effect will be successful.

☞ An experienced editor says, in a recent letter, "At present I am in the country, recovering from fourteen years of editorial life—bad eyes, crooked back, and broken nerves, with little to show for it."

☞ The opening of the Covington and Lexington Railroad to Cynthiana, a distance of 68 miles, was celebrated at the latter place lately, by a grand barbecue, provided by the citizens of Harrison county.

☞ There is a red oak tree on the land of Mr. Charles Hitt, near Alamucha, Miss., which measures thirty-seven feet in circumference. It is hollow, and the cavity is sufficiently large for a small bed-room.

☞ The Cincinnati Gazette states that the culture of the grape is rapidly extending through the interior of Ohio, and thus the foundation is being laid for a heavy and most important trade in native wine.

☞ About thirty years ago Gen. Cass owned a farm in what is now the heart of Detroit, and by simply "holding on," he has become the possessor of a fortune estimated at $3,000,000.

☞ The new Mayor of Washington City, Mr. Towers, is a practical printer. He was appointed Superintendent of Public Printing by Mr. Fillmore, and removed by Mr. Pierce.

☞ Mrs. Gen. Gaines has not yet abandoned her claim to the immense estates in Louisiana. She will now attempt to have the missing will of her father admitted to probate.

☞ Four of the largest hotels in Cincinnati, including the Burnet House, have been indicted by the grand jury for selling liquor contrary to the late prohibitory law.

☞ The Commonwealth is circulating a petition for the removal of Mr. Commissioner Loring from the office of Judge of Probate of Suffolk county, Mass.

News Brevities.

—The yellow fever is prevailing at Key West.

—Chief Justice Greene, of Rhode Island, has resigned.

—Senator Wright is very ill, at Newark, with a disease of the heart.

—A trout weighing twenty-one pounds, was taken in Crooked Lake last Tuesday.

—Burns, the fugitive, is to be sent further South, to find a new home and a new master.

—The Russian war draws heavily upon this country, as well as upon England, for specie.

—The appropriation for the Worcester (Mass.) schools for the current year, is $23,000.

—A recent traveler thinks we shall become exporters of flax, instead of importers, in a few years.

—The Saratoga Daily Sentinel says the number of arrivals there amount to eight hundred or a thousand a day.

—The Troy Daily Budget says Mrs. Robinson's counsel, it is understood, will make application for a new trial.

—There have been several cases of cholera in Boston and vicinity. Among them was Dr. Plympton, of Woburn.

—The Chicago Democrat thinks the population of that city, by the first of January next, will be one hundred thousand.

—The whole police force at Quebec have struck for higher wages. The sub-constables demand 7s. 6d. (about $2,50) per day.

—Macaulay has been unanimously elected President of the Edinburgh Philosophical Institute, in place of the late Professor.

—Several deaths from cholera have taken place at Milledgeville, Ga., among persons who had recently returned from Nashville.

—Owing to continued ill health, Dr. Benedict, Superintendent of the Insane Asylum at Utica, has resigned his office in that institution.

—Several hundred acres of woodland in Warren, N. H., was burnt over a few days since. It belonged to the Montreal Railroad Company.

—The Norwegian upper house has thrown out the clause in the Leprosy bill, forbidding the marriage of any one affected by the disease.

—It is stated that more than seventy cattle have recently died in Montpelier and vicinity, from the effects of being bitten by mad dogs.

—Two hundred female paupers, of good character, have been taken from the Cork Workhouse for transportation to Van Dieman's Island.

—A carpenter, named Alexander Derr, at work on the spire of a church at Sandusky, fell 65 feet to the ground, and was instantly killed.

—Attorney General Cushing has decided against the claim for interest on Florida depredation cases prior to 1819, amounting to $900,000.

—The small pox was fearfully on the increase at Jacksonville, Fla., at last accounts, notwithstanding every effort had been made to stop its progress.

—One of the severest hail storms ever experienced, passed over Augusta, Ga., on the 7th inst. It was, however, of short duration, and did little damage.

—The Steuben and Tompkins county papers intimate that the wheat crop thereabouts, will be light, many of the young plants having been winter killed.

—Cassius M. Clay, of Ky., has accepted the invitation of the Young Men's Association of Chicago, to deliver a Fourth of July Address on Independence day.

—An organ of the Women's State Temperance Society is to be started in New York city. Mrs. Vaughan, the able President of the Society, will conduct it.

—Matt. Ward's laundress, a young negro girl of nineteen years, passed through Detroit on the underground railroad, on the 27th ult., and was landed in Canada.

—A mountain of Spanish brown, estimated to be sufficient to supply the world for centuries, is reported to have been discovered in the vicinity of Elyton, Alabama.

—John Smith, Jr., son of the "Prophet," is a sub-contractor on the Warsaw and Rockford Railroad, having a section south of Nauvoo, upon which he is now working.

—A keeper of the Sing Sing State Prison, Mr. G. P. Sherwood, was stabbed on Friday week, by a convict named Murray, and so seriously injured that his life is despaired of.

—According to the Palmer (Mass.) Journal there are more dogs than sheep in that town, and the expense of keeping them is more than the amount paid to support the town's poor.

—It is stated, in well informed circles, that the President has appointed Gen. W. O. Butler, of Kentucky, as Governor of Nebraska, and Gov. Wright, of Indiana, Governor of Kansas.

—The Hon. Elisha Whittlesey is in receipt of the sum of one thousand dollars, being the contribution of Wesley Smead, the Cincinnati banker, towards the Washington Monument.

—John Van Buren is reported to have said that the Nebraska bill was the best ever passed in Congress, for the reason that "it will kill off every man from the free States who voted for it."

—The King of Holland's horses, a short time since, ran away with him in his carriage, and galloped at a fearful rate through several streets, before the coachman could pull them in.

—A couple of the most efficient Shakers of Enfield, have cut the Society and got married. The New Haven Register says they were heretofore regarded as fire proof specimens of the order.

—The celebrated Dr. Raffles, of Liverpool, was recently arrested, while traveling in Italy; because he wore a white hat, and for having in his writing desk a pen-wiper that looked like a cockade.

—A medal has been struck in Paris to commemorate the triple alliance of France, England and Turkey. It bears the motto, "Catholicism, Protestantism, Islamism—God protects them."

—The "Eastern Shore" of Maryland has within a few years past, exhibited a remarkable degree of improvement. Land has increased largely in value, and the towns and villages are rapidly growing.

—It is stated that recently an important change has been made in the Constitution of Buenos Ayres, under which alteration all persons born in the country are citizens, whatever may be their parentage.

—There is a shop for the sale of *samshoo*, or rice whiskey, in Hong Kong, which bears over its door the following inscription,—"The joys of paradise are nothing compared with a perpetual *drunk*!"

Congressional.

JUNE 12th.—SENATE.—This body met and adjourned without doing any business.

HOUSE.—The House did nothing of importance to-day.

June 13.—SENATE.—Senator Fish, of New York, presented a remonstrance from the Chamber of Commerce of that city, against the bill pending in the Senate changing the law respecting the essay office.

Resolutions were offered to fix the time of final adjournment, and also to change the hour of meeting for the daily session, which the Senate refused to consider, and then resumed the consideration of the Veto of the Insane Land Bill, and Mr. Cass proceeded to address the Senate, sustaining the course pursued by the President.

HOUSE.—On motion of Mr. McDougal, of Cal., the further consideration of the Pacific Railroad Bill was postponed till the 2d Monday in December next.

The House then resumed consideration of Mr. Giddings' resolution in favor of expelling Judge Nicholson, of the "Union," from his customary privilege on the floor, and the resolution laid on the table.

The House agreed upon a resolution fixing the adjournment on the 30th of August.

June 14.—SENATE.—Mr. Gwin introduced a joint resolution in favor of permitting Lieut. Maury to accept of a gold medal, as a testimonial from His Majesty the King of Sweden.

Mr. Walker gave notice that the friends of the Homestead Bill would make an effort to take it up on Monday next, and continue the discussion until disposed of.

The House resolution fixing a period for adjournment of Congress, was considered.

Mr. Gwin moved an amendment to the resolution so as to take a recess from July 17th to 16th October, which was adopted, and the resolution passed.

HOUSE—On motion, went into Committee of the Whole, and took up the civil and diplomatic appropriation bill, which was discussed at length.

June 15.—SENATE—Mr. Sumner presented the credentials of Mr. Rockwell, recently appointed Senator in the place of Mr. Everett.—They were read, and Mr. R., after being qualified, took his seat.

Mr. Pierce, of Md., from the Committee on Finance, reported back, with amendments, the bill providing for the payment of certain creditors in Texas.

The Senate then proceeded to consider the bill passed by the House for the extinguishment of the Indian titles in Minnesota and Wisconsin.

HOUSE.—The House proceeded to consider the bill increasing the rates of land postage in the United States.

Mr. Gerrit Smith moved an amendment providing for the act to remain in force two years, and at the expiration of that time the Post Office Department should be abolished, and individuals and associations shall be at liberty to carry the mails.

June 16.—SENATE.—The private calendar was taken up.

The bill to increase the rates of land postage was discussed. Mr. Olds, of Ohio, supported the bill, showing that the 5 and 10 cent postage caused a surplus in the revenue of $2,500,000 yearly, while the 3 and 5 cent system made a deficiency at the rate of $500,000 per annum.

The amendment offered by Gerrit Smith to abolish the Post Office Department altogether, was rejected, and then the bill itself was also laid on the table.

June 17.—HOUSE—The bill to increase the salaries of the Executive and Judiciary officers of all the territories of the United States, was read a third time and passed.

A bill to adjust the expenses of the Oregon and Cayuse war, and various other territorial bills, were passed.

The bill providing for the establishment of a weekly mail between the Atlantic ports and California, was taken up, and, after a long debate, postponed till a week from Tuesday.

A motion was then made to take up the resolution fixing a day for the final adjournment.

The motion was, however, lost, and the House adjourned.

NEW HAMPSHIRE POLITICS.—Great interest is excited on the subject of New Hampshire politics just now, as it is usually one of the staunchest Democratic States in the Union, and the home of General PIERCE. The Legislature met and organized by the choice of Democratic officers, but the Nebraska question has produced a struggle on the question of U. S. Senators and a State Printer; and thus far the difficulty has not been surmounted. There are two Senators to be elected—one for a full term, and the other to fill a vacancy—WELLES and HIBBARD being the Nebraska administration candidates. Two ballots for the short term were had, without success, WELLES failing of a majority by twelve votes.

ROCK ISLAND RAILROAD.—The papers for a couple of weeks back, have been flooded with correspondence from excursionists who availed themselves of the Rock Island Railroad celebration to visit the Falls of St. Anthony. Two trains started from Chicago, containing nearly twenty car-loads of passengers, who, on arriving at the Island, crowded six steamboats, and visited the Falls. The railroad company expended $30,000 on this celebration, and think it cheap advertising at that. The cholera broke out among the excursionists on the way, and one man died, which occurrence created a good deal of alarm, and something of a stampede.

COMFORTABLE APPAREL.—The London Times pays the following compliment to the dress of the British soldier:

"Loaded like a dray-horse, belted and strapped in like a dandy of the time of George IV., throttled by his stock, extinguished by his bearskin, and compressed to suffocation by his belts, the British soldier appears by the side of his French rival a monument of our folly and our obstinacy, an impersonation of the blunders of the past, and a discredit to the enlightenment of the present; and all this because there is no authority strong enough to interfere with the profits of clothing colonels, and to rescue the soldier from the tyranny of costume and the iron dominion of routine."

A Novel Affair.

FRIDAY afternoon, E. K. Collins, Capt. Nye, of the Pacific, Col. Borden, Hortio Allen and Thomas B. Stillman and others, in all twenty-two persons, sat down to a lunch, upon temperance principles, inside of the gigantic cylinder of the steamboat Metropolis, now being finished at the docks of the Novelty Works, for the Fall River Line.

This enormous cylinder is 105 inches in diameter, working with 12 feet stroke. It is 13 feet and 8 inches in length, and 34,099 pounds in weight. A horse and carriage passed through the cylinder several times without difficulty, and it looked large enough for an omnibus to pass through.

After the dinner was over, 101 men stood in the cylinder without difficulty, and it could have held several more.

The success of the engineers, in casting a perfect cylinder of such unusual dimensions, reflects additional credit upon the Novelty Works of this city.—*N. Y. Tribune.*

PATRICK HENRY'S SON.—The youngest son of Patrick Henry died not long ago, poor and alone, in a public house in Floyd county, Va.—Recently the tavern keeper applied to the overseers of the poor, for a special grant to indemnify him for boarding, funeral expenses, &c. This was refused on the ground that retrospective appropriations are unauthorized, and that it would be establishing improper precedent. I called to see the old man some months before he died; his given name was Nathaniel. He said he was young when his father died, but he remembered him perfectly, and was pleased to talk about him. His clothes were clean, but not whole. There was evidently a struggle between his pride of ancestry and his present poverty. He has been teaching what is here called an old field school, for amusement, as he insinuated, but from necessity, as I knew. His health failing, he removed to a hotel in Jacksonville, and was kept by the host for a year or more, who presumed that some relatives or friends would defray his expenses. He died with dropsy of the chest, in a few moments after the operation of tapping had been performed.

MONEY LOST IN THE MAILS.—An applicant for a patent, on his withdrawal of his application, instructed the Commissioner of Patents to forward to him by mail the sum of $20 due him from the government on said withdrawal. The money was sent agreeably to his instructions, and was lost in course of transmission. On his application to be remunerated said sum, it was held that the Post Office Department is established for the convenience of the people, and is a medium for them to transmit and receive intelligence and all mailable matter; but it is not an insurance office. The postage charged is no more, in the estimation of Congress, than a fair compensation for the services rendered, and is not a reward for any risk run in conveying mailable matter. If the Postmaster General, or the President and Senate, have appointed a dishonest Postmaster, the United States are not bound to remunerate the loss an individual sustained by his having violated the law; and no liability is imposed on the United States in this case, from the fact that they were the trustees of said applicant, and sent the money by mail as he directed.—*Washington Star, 9th.*

A RACE FOR LIFE.—As a train of cars on the Old Colony Railroad was on its way for Braintree, a few days since, the engineer discovered at some distance ahead an old horse grazing on the track. The whistle was immediately made to utter its most alarming shriek, when the horse signified his cognizance of the "ugly customer" in his wake, by very loudly neighing, and a lofty tumbling of the heels. But instead of clearing the track, the animal started off as if for a long heat, pursued his rapid course directly along the rails, and on came the thundering engine after him. Thus for half a mile or more the ancient race horse "held his own," but soon began to lag, and finding that the odds were a little too much against him, he plunged off the track into a ditch of deep mud, which proved nearly as hazardous to life, and made him look like anything but a horse as he emerged.—*Boston Transcript.*

ENGLISH PRESS AT THE SEAT OF WAR.—It is said that the English papers have their own reporters in the Turkish camp. The Morning Chronicle is represented by Captain Maxwell, an officer of the East India Company's service, who handles sword and pen with equal ability; he accompanies the Turks in their expeditions against the Russians, and took an active part in the battle of Oltenitza. Mr. Crowe, of the Illustrated London News, lounges about in the camp, and at the outposts, always sketch-book and pencil in hand, and draws scenes of camp life. The Daily News has two correspondents at Widdin and Rutschuk, Mr. E. L. Goodkin, the author of a good illustrated history of Hungary, and the Rev. J. C. Richmond, an American clergyman.

SILISTRIA, or as the Turks call it, Drista, which is just now so hard pushed by the Russians, is an important post, at the head of ship navigation on the Danube. It is a town of about the size of Syracuse, standing on the south side of the river, in Bulgaria, about 275 miles from Constantinople. It is the capital of the sub-province in which it is situated. It is strongly fortified, and its capture would give the Russians at that point, command of both sides of the river. At the last advices 25,000 men had been detailed to storm it. The bridge which the Russians are said to have constructed across the river, is of boats probably, as the stream there is very wide.—*Eve. Journal.*

SECRETARY DAVIS has recently submitted a report to the House of Representatives, by which it appears that during the year ending Oct. 1, 1853, not less than twenty-five steamboats were snagged on the western rivers, occasioning a destruction of property to the amount of $1,250,000. Property lost by sinking of flat boats, estimated at $255,000. Estimated value of steamboats sunk, $400,000. The annual loss of property from steamboat disasters on the Mississippi and tributaries, exceeds $2,000,000.

A STATEMENT is going the rounds of the press, to the effect that there are about 17,000 Israelites in the United States, and among them all, that not one is engaged in agriculture. This statement, it is hardly necessary to say, is incorrect. One of the largest planters in Kentucky, Mr. Benj. Gratz, an old personal friend of Henry Clay, is an Israelite, while in South Carolina and Georgia, and other States, there are many of that ancient faith extensively engaged in agriculture.

Marriages.

AT Manheim, Herkimer Co., N. Y., on the 8th inst., by Rev. Paul Weidman, NELSON GARLOCK and CATHARINE TORAN, daughter of Jacob Toran, Esq., all of the same place.

Commercial.

BUSINESS AND FINANCE.

THERE has been no arrival from the Isthmus nor of any foreign steamer during the week, but the departures have been regular, and taken out the usual modicum of coin and bullion on foreign account, amounting in the aggregate to about a million and a half.

Money is stringent in commercial cities, and is likely to be more so. Stocks are falling and something of a *bearish* feeling predominates among the brokers.

The Union Bank, of this city, has declared a quadrennial dividend of three per cent. payable in July. Business on the Canal is active and boats go loaded East and West, and although navigation opened thirteen days later this season than last, the aggregate of tolls is not far below that of the previous year, with a prospect of an excess before the close of navigation.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, June 22, 1854.

As we predicted, the market for breadstuffs has continued to decline, and wheat, during the past week, has fallen fully one shilling on the bushel, selling to-day at $2,25, and millers are reluctant to pay even that, anticipating further reductions. Corn is also lower, selling at 70@72c.

Butter and eggs higher and scarce for the season, grocers paying 16 cents for the former, and 14 for the latter.

Potatoes plenty and lower, bringing by the load four to five shillings per bushel.

The wool market dull and prices the same as last week.

Rochester Wholesale Prices.

NEW YORK MARKET—June 19.

FLOUR—Market dull and drooping, demand only for home consumption, and buyers will not take more than sufficient to supply their most pressing wants. Sales at $7,28@7,37½ for doubtful State; $7,50@7,75 for common to straight State; $7,75@8,25 for favorite State, and $7,75@8,50 for mixed to fancy Michigan and common to good Ohio. Market for Canadian flour heavy—sales at $7,75@7,87½ for good and extra brands. Rye flour dull at $3,87½ for Jersey.

GRAIN—Only a moderate inquiry for wheat and market no better. Sales good prime white Canadian at $2,05@2,07; new red South Carolina at $2,15. Only a moderate supply of Corn, and market, particularly for the better grades, firmer—sales at 75@80c for unsound; 81@83c for sound Western mixed; 82@83 for sound yellow. Oats in good demand at still better prices,—sales of State at 54@56½c, and 56@59c for Western.

PROVISIONS—Pork market continue firm and in good demand. Sales at $13@13,12½ for mess, and prime $11,75@11,87½. Lard firmly held—sales at 9½@9¾. Butter 14@18c for Ohio, and 17@20c for State.

ALBANY MARKET—June 19.

FLOUR AND MEAL—Under accumulating receipts and a moderate inquiry for Western and State flour, the market opened dull. We quote $8@8,50 for common to good Western and State; $8,50@9,02 for good to fancy Western; $10@10,50 for extra Michigan and Ohio, and $10,50@11,25 for extra Tennessee, the latter an extreme price. Corn meal is in good request at $1,56 per 100 lbs.

GRAIN—A quiet market for wheat, with a limited demand and but little offering. Sales of good white Michigan at $2,28. Corn—sales at 77@78c for Western mixed, closing firm at the outside figure, with but little left on the market. Rye and Barley quiet,—no sales. Oats not plenty,—sales Western at 52c, weight.

FEED—The market is easier and more active, with a supply offering. Sales 3,800 bu. in lots at $1,50@1,55 per 100 lbs. for middling and second quality.

BUFFALO MARKET—June 19.

FLOUR—There is no new feature to note in the market for flour. Sales small at $8,50@8,75 for fair to choice brands Ohio and Michigan.

GRAIN—The wheat market is dull and holders firm.—Sales Chicago spring at $1,50. In Corn, but little offering. Sales mostly to arrive, at 66c. Oats in good request.—Sales at 44c.

Freights dull. 55c on flour; 12c on Corn to N. York.

NEW YORK CATTLE MARKET—June 12.

AT Washington Drove Yard—Offered during the week 3,005 Beef Cattle. There has been a substantial increase in the number of cattle; but no material abatement in prices. We quote Beef Cattle $9@10, but $11 is a fair average; Cows and Calves are advancing; sales at $30@70; Veal Calves 4@6c per lb; Sheep $3@7; Swine (corn fed) $4,75@5 per cwt.

At Browning's—Prices at this market for Beeves have improved. Sales at $11,50@12,50 ₩ 100 lbs. for Beeves; Cows and Calves sold at from $30 to $50@60;—left over 25. Veal sold at from 5 to 6¾c per lb., live weight. Sheep range at from $2 to $6; Lambs at $2,50 to $6,50.

At Chamberlain's—Prices of Beef ranged at from $10 to $12,50 per 100 lbs. Cows and Calves of good quality in demand—sales at from $30 to 75. Veal Calves 4@7c per lb. Sheep and Lambs in good demand; wooled sold at 4@6c per lb.; sheared 3@7c. Lambs 2½@6c.

At O'Brien's—Sales of Beeves at $8@10,00. Cows and Calves at from $30 to $50.

ALBANY CATTLE MARKET—June 19.

AT W. Woolford's Bull's Head, Washington street.—Beef Cattle—1,000 at market. Prices—Extra $7,75; 1st quality $7,25; 2d do, $6,75; 3d, $6,25.

Cows and Calves—10 in market. Prices range from $25 to $35@50.

Sheep and Lambs—720 in market. Prices range at from $3 to $5.

Swine—Not any in market.

Remarks—Cattle are selling rather slow. The market has left within the past week from one to two dollars on a hundred. The market has been fuller this week with Beeves than it has been before for several months back.—Sheep and Lambs are in very good demand. Cows and Calves are selling well.

CAMBRIDGE CATTLE MARKET—June 12.

AT market 393 Beeves, no Stores. Market Beef—Extra, $9,00 per cwt.; 1st quality, $8,50; 2d do, $7,75@8,00; 3d, do, $7,75; ordinary, none. Hides, ₩ cwt. $6,25@6,50.—Tallow $8,00@8,50. Pelts, 50@1,25. Calf Skins, 13c ₩ lb. Veal Calves from $3 to $6.

STORES—Working Oxen—$95 to $130@192.

COWS AND CALVES—$32 to $55@62. Two years old—none. Three years old—$41 to $66@76.

SHEEP AND LAMBS—2,064 at market. Prices—Extra—$5 $6,50@7,27. By lot—$2,50 to $3,50@4,56.

SWINE—Sheats in lots to peddle 6¾@6¾c; retail 6¾@7¾c.

BRIGHTON CATTLE MARKET—June 15.

AT market 850 Beef Cattle, 30 pairs Working Oxen, 90 Cows and Calves, 1,800 Sheep and Lambs, 1,000 Swine.

PRICES—Beef Cattle—Prices have declined; a very small number brought higher quotations. Extra $8,50@9,00; first quality $7,75@8,25; 2d, $7,00@7,50; 3d, $6,50@7.

Working Oxen—Sales from $80 to $165. Cows and Calves $24 to $67. Sheep—Small lots $6@8.

Swine—Sheats, selected, 5¾@6¾c; ordinary lots, 6c.—Spring pigs 6¾@7. At retail from 5 to 7½c.

THE RURAL NEW-YORKER we can recommend conscientiously, as pure, good, interesting, and useful—calculated to make every family into which it is introduced, both wiser and better.—*Arthur's Home Gazette.*

AUBURN AND BUFFALO, N. Y.

Announcement.—A Very Interesting Book Coming!
Will be Published immediately, DANIEL BOONE, and the HUNTERS OF KENTUCKY! By WILLIAM H. BOGART, *Esq. In one elegant 12mo. volume, 399 pp. fully and richly Illustrated.*

"INTERWOVEN with the History of the entrance of the Great West into the family of civilized nations, is the career of DANIEL BOONE. It has been the object of the compiler of this volume, to present the narrative of that career in fidelity, and in such light as would rescue the memory of this great man from the common judgment passed upon him, of being only an Indian fighter and a bold hunter.

To DANIEL BOONE, the Great Pioneer of the West—having ever a purpose and a destiny before him—this volume invites the reader."

All orders must be addressed to
MILLER, ORTON & MULLIGAN, Publishers,
Auburn or Buffalo, N. Y.

LETTERS PATENT FOR DESIGNS, &c.

PERSONS wishing to obtain U. S. Letters Patent for Designs, are respectfully informed that all the necessary drawings and papers are executed by the undersigned, at the *People's Patent Office*, 86 Nassau st., New York, with dispatch, on very moderate terms.

Under the laws of the United States, Patents are granted for ornamental works and decorations of every kind, such as the ornamental designs upon stoves, walls, ceilings, wood and metal carvings, busts, statues, compositions of all kinds in alto and basso relievo, new forms of jewelry, watch cases, new designs for stamping on woolen, silk, cotton, or other fabric, or for any new impression, label, or ornament, to be placed on any article of manufacture, or any new and original shape or form of any article of manufacture. Such Patents secure to the Patentee the exclusive right to make and vend the same, for a period of seven years, the government fee being $15, gold.

The law for Designs requires the same process in soliciting, as for a mechanical invention, viz.: a model or specimen of the article, duplicate drawings, specifications, claims, &c. All the papers and drawings are executed by the undersigned. For further information, which can be had free of charge, apply to or address
ALFRED E. BEACH,
Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau st., New York. 231-4t

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

{ Office of the Boston Cultivator,
{ Boston, Mass., March 1, 1854. 218-6tw-3tm

THE WOOL GROWER AND STOCK REGISTER.
VOL. VI.—ENLARGED AND IMPROVED!

THE FACT that the circulation of the W. G. & S. R. has more than *trebled* during the past two years, and is daily increasing, induces us to venture an enlargement and improvement, which will at once render the work far more acceptable and valuable, if not indispensable, to all engaged in Wool Growing, the breeding of improved Stock, or the rearing of Domestic Animals generally. Though our arrangements are not entirely completed, we can safely announce that—

On the commencement of its Sixth Volume, July, 1854, the WOOL GROWER AND STOCK REGISTER will be enlarged to THIRTY-TWO PAGES monthly, printed upon new and handsome type, and essentially improved in other respects. The Yearly Volume will comprise 384 octavo pages, or *double* the number contained in the present, (exclusive of the advertising cover, which will probably be omitted.)—This will give ample room for the discussion of many subjects which require attention, but which we can scarcely notice with our present limited space. Among other matters, we propose to publish Pedigrees of pure bred cattle, horses, sheep, &c., and to give the names, residence, &c., of the principal breeders of improved stock throughout the country—for the mutual benefit of owners and those desirous of purchasing.

Arrangements are making to improve the *quality*, as well as increase the amount of reading matter. Regarding the reliability and value of its CONTENTS as of far more importance than the size or appearance of the paper, we shall endeavor to secure the assistance, as contributors to its pages, of the best and most experienced writers on the various subjects discussed,—and cordially invite the co-operation of all disposed to aid in enhancing its value and usefulness.

Although we hope to double the *value* of the paper, its subscription price will not be increased—even if perhaps to clubs of 20 or over. Single copies will be furnished at Fifty Cents—5 copies for $2, and 8 for $3. ☞ The first five volumes, bound in colored paper, will be sent post-paid, and the numbers of the 6th volume as issued, for $3.

The attention of all interested in the subjects and objects of a Stock Journal, is respectfully solicited. The readers of the RURAL NEW-YORKER are especially invited to visit the W. G. & S. R. an examination, and, if approved, their encouragement. Specimen numbers, &c., cheerfully sent, gratis, to all applicants. Address
May, 1854. D. D. T. MOORE, Rochester, N. Y.

RICHARD H. PEASE,
Albany Agricultural Works, Warehouse and Seed Store. Manufactory, on Hamilton, Liberty, and Lyon Streets—Warehouse and Seed Store, Nos. 369 and 371 Broadway, Albany.

EMERY'S PATENT RAILROAD HORSE POWER.

THIS Horse Power has, for several successive years, been subjected to many severe tests, both scientific and practical, in public and private, under every variety of circumstances and against the strongest competition throughout the United States, including California and Oregon. It has also met with great favor in Great Britain, as well as many of the continental countries of Europe, Asia and Africa; its superiority has been established in every instance beyond a contingency.

Among the peculiar properties of this Power, not possessed by any other in use, and which give to it its chief merit and popularity, are the following:—The Gears are outside the Power, (not under the horses) easily accessible and readily cared for. There being but two gears and one internal or converge gear and all with their teeth made very accurately upon the most approved form, insures strength as well as smooth and equal action, and avoids unnatural wear and friction.

These gears, as well as the pully, may be instantly transposed, by means of their couplings and fastenings, from side to side, or to produce different degrees of force and motion, thereby allowing a slower pace for the horses, without, in any degree, lessening the effect. This last feature, together with a longer platform for the horses, is of great importance, and are among its most prominent features. Very little increased friction or retardation is produced by any amount of wear, as is the case with most other Powers.

All the gears, pulleys, &c., are so constructed that the greatest stress, in all cases, is applied to those of the greatest diameters, their strength being proportioned to the squares of their respective velocities; while with most others the opposite state of facts exists, and necessarily the weakest parts are those most exposed to wear and difficult of access and care. Again, the sections of the endless platform being longer make a stronger and more durable plank floor for the horses. The platform returns over large circuits at each end, and is easily kept adjusted as to tightness, by means of tightening bolts at the forward end.

Prices for 1854.

"Emery's Patent Changeable Horse Power," Thresher, Separator, for two horses	$160
Do. for one horse	128
Do. Two-horse Power, with Thresher and Cleaner combined	245
Common Rack and Pinion Power Thresher, &c., two-horse	160
Do. one horse	120
Emery's Patent Two-horse Power including band wheel	110
Do. one-horse do	85
Common Rack and Pinion, two-horse	105
Do. one-horse	75
Threshing Machine, with Separator and fixtures, 28 inch cylinder	40
Do. 24 inch cylinder	37
Set of Bands for Machine, with extras, &c.	5
Fanning Mills, fitted for Power	$26, 28, 30, 32
Portable Circular Saw Mills, with 24 inch circular saw for wood cutting, &c.	37
Extra table and saw for slitting boards and fencing stuff, and general shop use	7
Upright or Felloe Saw, for wheelwrights' use	40
Cross-cut Saw, arrangements greatly improved, to attach to Power for cutting logs	25
Churn attachment to Power, for one or more churns	12
Feed Mills, with iron plates	40
French Burr Stone Mills, for farm or mill use	$120 to 300
Power Corn Sheller	40 to 55
Clover Huller	30 to 100
Improved Dog Powers	12 to 15

TERMS—Cash or approved notes or acceptances, with interest, payable within four months, in Albany, N. York, Boston, Philadelphia, or Baltimore, as may best suit the purchaser.

As proof of the conceded excellence of this Power in its construction and actual performance, the public are referred to the numerous awards and decisions of juries, judges and committees, at all the principal Fairs and Exhibitions in this country, comprising those of nearly half the States in the Union, among which are the following, where it received the First Premium:

New York State Ag. Society	1853, 1852, 1851, 1850
Ohio State Board of Agriculture	1853, 1852, 1851, 1850
Michigan State Agricultural Society	1853, 1852, 1851
Indiana, Illinois, Pennsylvania, Maryland and Missouri State Agricultural Society	1853
American Institute	1853, 1851
Canada Provincial Society	1852, 1851
Exhibition of Industry of all Nations in New York	1853

Many more flattering testimonials might be produced, but as all are sold with a liberal warrantee, it is unnecessary.

The subscriber has purchased the entire stock and fixtures of the Warehouse 369 and 371 Broadway, and Manufactory of the late firm of EMERY & Co., of this city, and intends to carry on the business of manufacturing and selling Agricultural Implements.

The subscriber will also furnish to order and keep constantly on hand, a good assortment of the most approved machinery for the farm and plantation, including Reaping and Mowing Machines, Grist Mills, Power Corn Shellers, Corn Hullers, &c., together with a complete stock of Implements designed for the Garden, Farm and Plantation, in all the various departments, with a full and complete assortment of Field and Garden Seeds—as Clover, Timothy, Blue Grass, Orchard Grass, &c. For further particulars, address the subscriber, who hopes by due attention to business and a desire to please those who feel disposed to favor him with their orders, to merit a share of the patronage of the agricultural community.
Albany, 1854. RICHARD H. PEASE.

The above Horse Powers, Threshers, &c., may be obtained of E. D. HALLOCK, Rochester, N. Y. 231-2teow.

LAND PLASTER

AT Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.
217-4m. JIRAH ROWLEY.

Poetical.

[Written for the Rural New-Yorker.]

RESIGNATION.

BY W. E. C. KNOWLES.

A cloud swayed lightly in the summer sky,
A shadow crossed the threshold of my door;
I looked above me, and above me I
Saw that the cloud grew brighter than before.

A flush of sunset threw its glory there,
And touched with many fires each edge and fold:
I looked above me, and it seemed a stair,
Up which to tread to palaces of gold.

My child was near me, and beheld the cloud,
And mounted up the stair-way of the sky;
Alarmed, I tried to follow, but a shroud
Dropped down between me and my child on high.

I oped my mouth, and waved my hand to him,
Speechless with agony, and nameless fears;
He called to me; and though my sight was dim,
I saw him still ascending, through my tears.

And as a glory overspread the cloud,
And vanished with my child, to ne'er return,
I heard a voice call down to me—not loud—
Which bade me to rejoice, and not to mourn!

I knew it was the voice of God! I know
His power bore my child on high to Him;
And, knowing this, my heart grew strong anew,—
My tears were dry, although my eyes were dim.

All power is His! Does He but speak the word,
Our steps grow feeble and our hearts grow faint;
We feel within that we must rest; and gird
Our shroud about us, like a faithful saint.

Happy is he, who, in his pilgrimage,
Can with the truthfulness of wisdom say,
That he has learned the precepts of the sage,
And set his house in order, day by day.

To such a one shall truth and mercy give
A strength before unknown. The golden rod
Of wisdom shall be his to touch and live,
When ushered in the presence of his God.

Take heart, O man! our lives, but short at most,
Are but the prelude to an endless day;
And like the ripple, by the zephyr tossed,
Murmur the sweetest as we pass away.

Rural Sketch Book.

[Written for Moore's Rural New-Yorker.]

THE WIDOW'S DOWER;

OR, SELF-SACRIFICE REWARDED.

BY EDWARD WEBSTER, ESQ.

It was a sad, sad evening in the little farm-house in the glen, for on that day the husband and father had been laid in his grave; and the disconsolate widow, and such of the children as could be collected beneath the parental roof for the purpose of paying the last sad tribute of respect to the deceased, were sitting silently and in tears amid the sombre gathering shades of the approaching night. Such of the children as could be collected, we say, for part of them were scattered over the wide world, far away from their childhood's home. The candles were not yet lighted, nor was the usual cheerful fire blazing on the hearth, for darkness and chillness accorded well with the feelings and sentiments of the mourners. The mother who has lost the chosen companion of her life, with whom, amid joy and sorrow, hope and fear, health and sickness, she has made her earthly pilgrimage down into the vale of years, and then had him taken from her side, and the children who have been reared to man's estate by one of the best of fathers, and then assisted at the last sad rites of laying that father in the tomb, can sympathize with the mourners on the present occasion. For a long time they sat in silence, save when a broken sob from one of the members was answered by a responsive sigh; but tears trickled down even manly cheeks unrestrainedly.

At length one of the brothers arose from his seat, and approaching the widow, said:—"Mother, it is dark and cold here, at least for you and the girls. Shall I kindle a fire and light the candles?"

"It is neither so dark nor so cold as the grave, but it is scarcely less cheerless," responded one of the sisters; "and it does not seem right that we should enjoy light and fire, now that our dear father who provided them for us through all our early years is slumbering in the cold ground."

But the widow, who had long been noted as an exemplary Christian mother, rallied at an expression which sounded to her like a murmur against the afflictive dispensation, and observed: "There is light and life on the other side of the dark valley, and it does not become us to sit down here and give vent to vain repinings at the chastenings of our Heavenly Father. The warning comes home to us to be also ready; and there is work for us to do, which must be done while it is yet to-day."—So saying, she directed the girls to make preparation for supper, as the family had fasted during the whole of that sorrowful day. The employments of the evening, by diverting their thoughts from the cause of their grief, served to dispel partially the dark cloud which had settled over the minds and thoughts of the family; and at an early hour they all retired to rest—that rest which had been broken by long watchings beside the sick bed of him who now had no further need of their affectionate attentions, beside his quiet bed beneath the clods of the valley.

Alfred King, the deceased, had been the father of a large family, which he had labored earnestly to rear up in the paths of honest industry. Setting out in life with small pecuniary means, and finding himself unable to accumulate anything in the old community where he was born, he pushed off at an early day to what was then the outskirts of civilization, viz. Western New York, and located upon a farm which he purchased at a very moderate price, to be paid for at some future day. But sickness, and the other concomitants of a new settlement, kept him back. There was no market for grain; and all those articles of merchandize, which even the most economical family must have, were exorbitantly high. In addition to this, a large family of young children filled his dwelling, who, if they were a blessing to him and cheered his leisure hours with their sunny faces and merry pranks, were also a severe draft upon his earnings and energies. Time sped on. Those children had to be sent to school, and provided with books, as well as to be fed and clothed. He felt truly that the noblest heritage he could leave them, was the best education his means afforded, and that intellectual treasures were to be prized above silver and gold. His wife coincided in his views, seconded his efforts, and lent her best energies to discharge the responsible duties of a mother. She managed the household with prudence, and failed in nothing on her part; but still, the best that could be done was to make the ends of the year meet, without any advancement towards a competence for their old age. The farm was still encumbered, and as the time came round which was stipulated for payment, there was nothing in the family treasury to meet the demand. Times were hard, and money could not be obtained on the most undoubted security without the payment of usury. There was no alternative, however, but to submit to the demands of the money-lenders, and a mortgage on the farm of one thousand dollars, at five per cent. semi-annual interest, was the best thing that could be done.

In some respects, the prospects of the family improved, however. A market, in consequence of the opening of the Erie Canal, was afforded for produce, and lands were rapidly rising in value, so that Mr. King believed if he could manage to pay his interest, and gradually improve his farm, even if he was obliged to sell in the end, there would be a surplus left, after paying off the incumbrance. Some of the elder of the children were likewise now able to provide for themselves. He had given them a good common school education, the best he could afford to do for them, and one or two had gone to trades. One more ambitious than the rest, or less willing to labor physically, had aspirations collegeward, and urged his father to assist him in acquiring a liberal education; but he was met by the reply:—"It cannot be done in justice to your brothers and sisters! I might possibly aid you partially in such an undertaking, but I could not pay the whole expenses of your course; and, besides, all I could do for you above a common school education, would be injustice to the other children. Rigid impartiality between you all, is my fixed and unalterable rule. I should be glad to see you all graduates of a University, but that being out of the question, you must be content with what chances of education I can give you equally.

"But you are willing I should go, if I can pay my own way, are you not?" rejoined the youth.

"That is impossible. It would cost twelve hundred dollars at the very least to go through College, and such a sum you could not earn under any circumstances."

"But I might earn a portion of it, and perhaps some gentleman who has the funds would be willing to lend me the balance, to be repaid in after years."

"It is preposterous to think of it; you cannot loan money, on real estate security even, short of ten per cent., and who would be willing to lend you, a mere boy, any such sum on personal security alone?"

So the subject dropped, and the boy went to a trade. He went to it, however, with the lingering hope and desire for a College education, and at a later period in life, actually accomplished it by the labor of his own hands. What will not tireless energy and an unwavering pursuit of a specific object finally overcome!

The elder sisters also had done something for themselves. Two of them boarded at home, and walked a mile and a half to a select school, located in the village, and there acquired an education which qualified them to become teachers of district schools.

If matters had thus continued to prosper with the family, the pecuniary difficulties under which they labored would have been surmounted; but at this juncture a series of unsuccessful harvests, dullness in all except the money market, and other untoward circumstances, plunged Mr. King deeper and deeper into debt. In addition to this, his own health began to fail. The severe labors of his whole life told upon his constitution, and besides, the period of active service was past with him. Creditors pressed for their demands, and seeing no other means of relieving himself from the load of embarrassment, except by disposing of the farm, he advertised it for sale. Speculators looked at it, and held back under the idea that a forced sale must come at last, and then a better purchase could be made. A pressing necessity is the worst possible recommendation for a sale; and any article, from a farm downward to a load of wood, is never in better demand than when the holder refuses to part with it on any terms; while on the other hand, if it must be disposed of, the unfortunate owner may go begging for a purchaser in vain.

Certain *good* neighbors, such as exist unfortunately in every community, who are envious of other's prosperity, and never feel better than when they see misfortunes accumulating outside of their own household, united in crying down the farm in the market. One individual who secretly desired to purchase at a low figure on his own account, declared that a man would grow poor upon such a piece of land. "Old King," he said, "bought the farm for a song years ago, and owed to-day twice over what it cost." Another said "the noses of the whole family would have to come upon the grindstone yet. The girls prided themselves on being better scholars than others, and went to school when they ought to be spinning like his own daughters. It was true, they could cipher and parse, and all that sort of thing, but he would like to know what that was good for?" These and other causes interfered with the sale, and men looked forward to a final breaking up of the family; some, like those above described, with a feeling of gratified malice, but the larger portion of the little community, who really esteemed an honest and upright family, with real pain.

While these things were transpiring, a greater misfortune fell upon the family in the removal of the father, as we have stated above, by death. The estate had then to be settled at all events; and the widow and children assembled in the humble parlor to devise the ways and means of doing so to the best advantage. One sentiment pervaded the entire household, and that was to preserve from even a shadow of reproach, the reputation of the deceased.

"He has lived an honest and an honorable life, and done his duty by us as a parent," remarked one of the sons, "and we would be ungrateful to suffer even the stain of insolvency to rest upon his memory."

"If he had his honest dues, and had not been compelled to pay the unjust demands of men who took advantage of his embarrassments, there would be sufficient on hand to-day to pay off all his debts, and leave the farm for the use of mother and the younger children," remarked another.

"That is no fault of honest and conscientious creditors," responded the first; "and now that father is in his grave, there is not one of us, I am sure, but would rather endure hardships and poverty, than to receive a fortune at the expense of his integrity. It is far better that he goes to his rest as the sufferer, than the inflictor of wrong."

"If mother were protected," observed one of the sisters, "the balance might go; it is too bad that she is to be left unprovided for at last, after such a life of labor and trials as hers has been."

"But she will be provided for, partially at least; the farm is worth five thousand to-day, and is encumbered only for one thousand. Creditors cannot touch the dower interest while she lives, and after that let them have it."

"But at this juncture the widow interfered, declaring she would claim nothing until the creditors were paid to the utmost farthing. With this understanding, one of the young men more accustomed than the others to the details of business, was joined with the widow in the administration. She signed voluntarily a release of dower in favor of the creditors, and the mass of loose and unadjusted claims were looked into and settled. Some claimants did say that the joint Administrator was too precise, and rejected items of account that ought to have been allowed; but the number of suspicious and illegal demands always presented on such occasions, requires an Administrator to be a strict constructionist if he would protect the interests of the widow and the orphan. However, none of the grumblers had sufficient confidence in the justness of the rejected claims to attempt their establishment by a suit at law, and no others had occasion for such an appeal. The Administrators asked of the principal creditors an extension of time, which was cheerfully granted; the personal property was collected and sold, and the avails distributed, and an application then made to the Surrogate for an order to sell the real estate.

At this time a remarkable and favorable change took place in the price of lands. California and Australia were pouring into the lap of commerce their millions on millions of gold; speculations in produce stimulated the markets to great activity, and reports of deficient crops in Europe called for an increased amount of American grain. Farms rose in the market, and lands that could scarcely be sold previously at any price, were now sought after with avidity. The order to sell was granted, and the farm advertised for auction early in the spring, and the widow and heirs looked forward with great anxiety to the day of sale. Men who had hoped to purchase for less than the land was worth, were despondent, and those who really wanted a farm at a fair price set themselves at work to prepare for a spirited contest. The day of sale at length arrived, and a large number of competitors were early on the ground. Not a cloud obscured the sky, and the few warm days which had preceded, gave nature a smiling aspect and an earnest of returning spring. The auctioneer mounted the bonnls, and the bids commenced, slowly and heavily at first, and at a low figure; but as the audience began to warm up by competition, the bidding became more spirited; the countenances of the Administrators brightened as each successive dollar on the acre was added to the price, amid the jokes and felicitous observations of the auctioneer. Once or twice a bid of five dollars on the acre was made by some bold or bluffing competitor, which would come in like a broadside upon the opposing parties; and then again dollar or half dollar bids would succeed, like dropping shot from a party of skirmishers, until at last the contest was left to two or three men of ample means and undoubted credit, and the farm was finally struck off to them in parcels, and at prices that came fully up to the expectations of those most interested in the sale.—The avails were sufficient to pay off all the debts, and leave a surplus of eighteen hundred dollars for the use of the widow during her life, and to be eventually distributed among the heirs. The croakers were silenced, the solvency of the estate established, and a humble income, notwithstanding the voluntary and self-sacrificing relinquishment of her legal rights in favor of creditors, was saved to the widow, and a small reversion preserved for ultimate distribution among the heirs.

'Tis an ill thing to be ashamed of one's poverty; but much worse not to make use of lawful means to avoid it.—*Thucydides.*

Youth's Corner.

ILLUSTRATED REBUS, NO. 27.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

MISCELLANEOUS ENIGMA.

I am composed of 38 letters.
My 18, 13, 28, 4 should never be neglected.
My 26, 15, 23, 30 is dear to all.
My 25, 19, 11 should always be obeyed.
My 4, 12, 13, 37, 20, 5, 16, 7 is both the death and life of man.
My 34, 5, 35, 2 never should be squandered.
My 2, 31, 33, 21, 25 should always be our motto.
My 17, 12, 3, 35, 18, 12 teaches the rudiments of language.
My 23, 1, 24, 5, 14 is of many kinds.
My 19, 10, 22, 18 is a proper name of persons.
My 6, 33 is an abbreviation of one of the U. S.
My 27, 37, 14, 2 signifies before.
My 32, 29, 36 is a lady's name.
My whole is a saying which, if it were more regarded, would make us much wiser and happier.

E. E. H.

NEW VOLUMES.

THE WATER-CURE JOURNAL, AND HERALD OF REFORMS.—Devoted to Physiology, Hydropathy, and the Laws of Life and Health. Illustrated with numerous engravings. Quarto. Published Monthly, at $1 a Year, in advance.

We know of no American periodical which presents a greater abundance of valuable information on all subjects relating to human progress and welfare.—*N. Y. Tribune.*

This is, unquestionably, the most popular Health Journal in the world.—*N. Y. Eve. Post.*

THE AMERICAN PHRENOLOGICAL JOURNAL.—A Repository of Science, Literature, and General Intelligence; devoted to Phrenology, Physiology, Education, Mechanism, Agriculture, and to all those Progressive measures which are calculated to Reform, Elevate, and Improve Mankind. Illustrated with numerous Engravings. Quarto, suitable for binding. 288 pp. Published monthly, at One Dollar a Year.

It may be termed the standard authority in all matters pertaining to Phrenology, while the beautiful typography of the Journal, and the superior character of the numerous illustrations, are not exceeded in any work with which we are acquainted.—*American Courier, Phila.*

Fowlers and Wells have all works on Physiology, Hydropathy, Phrenology, and the Natural Sciences generally. Booksellers supplied on the most liberal terms. Agents wanted in every State, County and Town. These works are universally popular, and thousands might be sold where they have never yet been introduced.

Letters and other communications should, in all cases, be post-paid, and directed to the publishers, as follows: FOWLERS and WELLS, 308 Broadway, New York. 21

THE DATE LEAVES;

A HISTORICAL GAME OF FORFEITS, by C. A. BLOSS, Principal of Clover Street Seminary, Rochester, N. Y.; Author of Bloss' Ancient History; Heroines of the Crusades, &c.

Over Four Thousand Packs Sold in the First Ten Days.

The Date Leaves form a system of Social Games, intended for Parlor Amusements, Educational Incentives, or regular School Instruction.

It is believed that they possess all the *social qualities* of Gaming Cards, without that tendency to dissipation which makes card-playing so dangerous to young people. They place the company in pleasant sets, face to face; they inspire mirth, and furnish subjects for conversation; and these subjects are such as excite inquiry and provoke research, and give systematic arrangement to the items of information which float uselessly in the memory.

No person can become acquainted with these Cards without gaining more historical information than he could by a year's reading, according to any method now before the public, and the *readiest* way to become acquainted with the Cards, is to *play* the games according to the directions which accom any the Cards. Price 50 cents. Published by WANZER, BEARDSLEY & Co., Rochester, 232-4t ALDEN, BEARDSLEY & Co., Auburn

WOOD AND COPPER PLATE ENGRAVING.

MILLER & MIX, Designers and Engravers, No. 10, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of book illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed at short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. L. C. MIX.
232-tf JOHN MILLER.

BOOKS BY MAIL FREE OF POSTAGE.

Upon the receipt of the price of any work by mail, the work will be forwarded free of postage, to any address.

BOOK AGENTS WANTED!

To sell New Publications, Maps, &c., &c., to whom a liberal commission will be allowed. A small cash capital of $25 to $50 will be required, and the Agent will be indemnified against loss on the stock. Address D. M. DEWEY,
231-3t Bookseller, Rochester, N. Y.

GLEN HAVEN.

THIS Water-Cure takes the first rank of establishments of this kind in the United States. During the past winter there have been from sixty-five to seventy persons in it taking Hydropathic treatment, and at the date of this advertisement there are not less than eighty who come from sixteen different States, and Canada.

The Institution is not nearly full, and the proprietors take pleasure in stating that for beauty of location, salubrity of climate, purity of air, softness, purity and abundance of water, Glen Haven is without a rival.

The Physicians; Doctors J. C. & Mrs. L. E. Jackson, and Dr. Harriet N. Austin, are known wherever the Water Cure Journal is read.

Our route is from the east or west on the Central Railroad to the Junction; thence by omnibus to Skaneateles, and up the lake on the steamboat, or by James Tyler's livery. For further particulars apply for Circular. Address, Post-paid, J. C. JACKSON, M. D.
230-4t. Scott, Cortland Co., N. Y.

THE PEOPLE'S PATENT OFFICE.

THIS well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with Inventors from 9 A. M. to 5 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid, ALFRED E. BEACH,
Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Address as above.

Valuable Farm for Sale, IN LOCKPORT, N. Y., on account of the proprietor's health. About 200 acres, with ample buildings, orchard, &c. Lying just outside the corporation line it offers an excellent investment, as the rapid growth of Lockport (present population 10,000,) constantly enhances its value. Will be sold together, or in parts, on easy terms. Inquire of E. B. GALUSHA, or O. C. & E. C. WRIGHT, Lockport. 230-4t*

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $16; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance.* The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:

EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. Bixby,—H. C. White,—T. E. Wetmore.

The Rural New-Yorker is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the Important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and hand-some engravings, than any other paper published in this Country,—rendering it a complete Agricultural, Literary and Family Newspaper.

☞ For Terms, &c., see last page.

Rural New-Yorker.

Progress and Improvement.

STACKING HAY, GRAIN, &c.

The moist climate of Great Britain renders necessary great care in housing and stacking hay and grain. Wheat and other grains are seldom sufficiently dry at harvest to be thrashed. A very small proportion of the English wheat crop is thrashed before Christmas, and most good farmers are very particular to have it taken from the rick to the barn, and thrashed in clear, dry, frosty weather. The ricks of wheat are universally placed on frames. These differ somewhat in their construction in different districts, but the most approved are made by placing a wooden circular frame work on stone pillars about three feet high, and capped with a circular stone having a flat lower side, expanding about four inches on all sides of the upright pillar, so as to prevent mice and rats from getting into the stack. But preventing the entrance of vermin is not the principal object of having the ricks placed on frames, as some American writers on British agriculture have asserted; the great advantage of the plan is owing to the fact that when placed on an elevated open frame work, the air circulates through the entire rick, and grain that is in only tolerable condition when harvested, will, by February or March, be nearly as dry as our Genesee Wheat. A rick that contains 150 bushels, is considered rather large.

In stacking hay the British farmers are equally particular. The bottom of the rick consists of wood and straw from one to two feet deep, so as to prevent all injury from the dampness of the earth, and afford some chance for the air to circulate through it. Nor is this all; if the hay is not in very good condition, as, from the nature of the climate is frequently the case, a sack—(the common grain sacks of the country hold from 4 to 5 bushels and are about 2 feet in diameter and 4 feet long, and are as ridiculous in the eyes of a go-ahead Yankee as the lumbering four-horse tandem wagon, massive harness, ponderous horses, and their stolid, smock-frocked, heavy-hooted driver,)—one of these sacks is filled with cut straw or chaff, and placed upright in the centre of the rick, placing the hay around it, and drawing up the sack as the rick rises; in this way a chimney is formed from the bottom to the top of the rick, and all injury from heating is avoided. In stacking clover this plan is frequently adopted, as the thick, succulent stems of the plant are difficult to cure; but, when sprinkled with salt and properly ventilated in the rick it comes out excellent hay, and is preferred for horses and sheep to the best timothy or English meadow hay, and commands a higher price in market.

We allude to these practices of our trans-Atlantic brethren, not for the purpose of recommending their adoption here—our superior climate rendering them unnecessary—but simply to call the attention of our intelligent farmers to the subject of stacking hay and grain. We are persuaded that even in this proverbially dry climate, great loss is sustained by placing hay and grain on damp ground, with nothing more than a little straw intervening, and frequently not even that. English farmers never put their hay in barns, and very seldom any of their grain, especially wheat,—experience teaching them that they do not keep so well as in a properly-constructed rick. This is owing to the fact that most of the barns are built of brick or stone, and are comparatively air-tight, although holes are made at certain distances in the side walls for the purpose of ventilation. With our wooden barns, it is the general opinion that hay and grain come out better from a barn than from a stack. But few farms have sufficient barn-room for housing all the hay, grain, and corn-stalks, and it is a question of some moment which of these should be placed in the barn, and which in stacks. It is very advantageous in feeding out hay in winter, to have it in a barn; and when the grain crops are thrashed immediately after harvest, we should prefer to occupy the barns with hay, rather than with wheat, &c., being careful to build and cover the grain ricks so that they will receive no injury from rains.—On many farms, more is made of corn-stalks than of hay, and it is, also, very convenient to have them in the barn. If the grain-crops are thrashed early, they may be placed in the barns, and be out before they are wanted for the corn-stalks. All these matters should be taken into consideration, when each farmer must decide for himself which course it is best to adopt.

We would simply add to these discursive remarks, that we believe all hay and grain, whether in barns or stacks, would be greatly benefited by being built on a kind of temporary frame work, made by laying sticks of cord wood across each other till from one to two feet above the ground. All danger of dampness from the ground would be avoided, and the air would have a chance to permeate through the mass. A few cords of wood only would be required, which would be just as good after the hay or grain was removed as before, so that the expense would be a mere trifle.

BONES AS A MANURE.

Mr. Levi Bartlett, of the *Practical Farmer*, has politely complied with our request for a little more information respecting the process of dissolving bones in sulphate of potash. The sulphate of potash was dissolved in water, making a lye strong enough to float an egg or potato, leaving at least half of the surface of each exposed. The bones—mostly hornpiths—were partially broken up, and packed into a forty gallon iron kettle, and lye enough poured in to cover the bones. An hour's boiling reduced most of the pith to pulp, and some three hours' boiling disintegrated the harder bones of cattle. By washing the sediment, the bone was found as white, and nearly as fine, as flour. A sample of this powder was sent to Dr. Jackson, of Boston, who found, on examination, that it had undergone only partial changes—much of it being still phosphate of lime; but there was an excess of carbonate of lime, showing that a portion of the bone had been decomposed. The proportion of carbonate of lime is found to differ materially in different samples of bones, and the fact that Dr. Jackson found a greater proportion than usual, is not "positive proof" that any change had taken place; and there are several reasons why we should expect that no phosphate of potash would be found, but our space forbids them mention.

Mr. B. refers again to his attempt to decompose bones by the aid of moist, unleached ashes, and says:—"We are now sorry to say that this experiment did not meet our expectations—We think it requires a very equable state of moisture in the ashes for a long time to decompose them." This is in accordance with our own experience, not only with ashes, but in disintegrating them with peat or any fermenting mass. Mr. Bartlett adds:—"The avidity with which our cows and young cattle seize upon old bones, and '*chaw*' them for the half hour together, at all seasons of the year, has long since satisfied us, that there was a deficiency of phosphates in the soil of our farm. To remedy this evil, as far as practicable, we have, for a number of years, collected bones in considerable quantities, from various sources; and, to render them immediately available for our crops, we have tried many different methods of rendering them soluble, but must say with Mr. Harris, 'we fear there is no process, by which bones can be employed as manure, equal to the old-fashioned method of grinding.'"

TO HEAD FUGITIVE BEES.

We were recently on the farm of George W. Goodhue, Esq., of Wheatland, N. Y., when word was brought us that two hives of bees had swarmed, and were flying away. On going to the house, we found all the good "women folks" playing a not very harmonious or melodious tune with tin pans. But the fugitives would not listen to the notes of the fair charmers. Their Queen was ravishing them with sweeter strains than the *Good-hued* republicans could generate with milk pans and iron-sticks; while their efforts to drown the music of the young Queen, though offering fairer prospects of success, were equally abortive. The bees had flown a considerable distance from the house, when Mr. Goodhue reached the scene. "Now," says he, "I'll show the Rural New-Yorker how to head runaway bees." He procured a large looking-glass, and running ahead of the bees, placed the glass in such a position as to throw the rays of the sun right across their line of flight. By moving the glass rapidly, and throwing the rays of light, like flashes of lightning, in all directions except the one in which he wished the bees to go, he not only stopped their flight, but in less than three minutes had them safely lodged in the fork of a tree. Mr. Goodhue says he has never had a swarm escape him since he adopted this method."

THE OSAGE ORANGE,—NO. 1.

Within a few years, the attention of the public has been directed to the Osage Orange, as a suitable shrub for live fences or hedges.

The Osage Orange *(Maclura aurantiaca)* is an American deciduous tree, growing wild in the southwestern portion of the United States, in Arkansas, Louisiana and Texas, where it attains the growth of the second or third class tree. In the middle and northern States it seldom grows more than ten to fifteen feet high. It is very branching, each branch being armed with a multitude of sharp thorns. The wood is very tough, and has the reputation of being durable. The male and female flowers are on separate trees, the female tree bearing fruit abundantly in a few years. The fruit is round, rough, and of a greenish color, as large as well-grown apples, and contains from one to two hundred seeds each. The substance composing the ball is of a spongy, tenacious substance, and each seed is enclosed in a tough, fibrous covering, making it difficult to extract the seed and not injure its vitality. Many persons resort to scalding and high fermentation as the easiest method, but as either process generally renders the seed unfit for market, purchasers and dealers cannot exercise too much care in the selection of the seeds.

The plant has proved to be hardy enough for cultivation, and to stand the climate of not only the Middle, but of the Eastern States; though it has been found necessary to protect them in the nursery, and in the young hedge-row, by a layer of straw or evergreen bushes scattered over them during the winter. After they have attained one year's good growth in the hedge, this precaution will not be necessary. The plants of the Osage Orange are naturally very thrifty, free growing, attaining, in favorable locations, to five and six feet in height in one season. This renders them well adapted to the formation of hedges, as in three to five years, with proper cultivation and care in pruning and training, they will make a superior hedge. For the first two or three years, the young shoots and ends of the branches will be injured by frost, but not to the injury of the fence.

Preparing and Sowing the Seed. Perhaps as good a way, and by many preferred, particularly at the North, is to procure the seed in the fall, and mix with moist sand, put them in the coldest place you have, as on the north side of a house, where they will freeze thoroughly during the winter, and plant in the spring.

If the seed be procured in the spring, the planting may be deferred until the ground becomes warm. In the latitude of New England, any time during the month of May will answer. In order to have the seed vegetate quickly, it should be put to soak in soft *warm water*, and allowed to remain three, four or five days, or until they are much swollen, and the germ begins to appear. Keep the water constantly warm, by allowing the vessel to stand in a warm place, covered with a cloth, and change the water daily, to avoid fermentation; mix with a little dry earth or sand when you get ready to plant. The ground for the nursery should be a rich, sandy loam, deeply plowed and finely pulverized. If you have none such, supply the deficiency by hauling sand or wood's mold, on to the best and richest spot of land you have, and mix thoroughly with the soil.

Proceed to lay it out in drills eighteen inches apart, and drop the seed at intervals of one-half inch in the row; cover with fine earth a few inches deep. Be sure to *pat well* the ground above, so as to press the earth tightly around the seed. If the weather now be dry, the surface should be plentifully watered, as much depends on keeping the seed constantly moist after being put in a way to sprout.

In about a week or ten days, if the weather prove favorable, the young plants will begin to appear. At first they are very tender, and will need care in weeding, but in a few weeks will become hardy and tough like the locust.

Cultivation should be continued throughout the season, in order to secure as large a growth as possible. If convenient, late in the fall they may be taken up, and after cutting off the tops to within an inch of the roots, pack away the roots with a little sand in a dry cellar; they will then be ready for transportation or spring planting.

If designed for use by the grower, they will be better to remain in the ground during winter, with such protection as has already been recommended. In the west and other favorable localities, they are protected in winter by a furrow thrown up on each side of the row, covering the roots, and a portion of the trunk and limbs at the bottom.

The Hedge Row. Before placing the plants where the hedge is desired, some preparation of the ground will be necessary. The roots naturally grow very deep, enabling them to stand severe droughts, and preventing disturbance by the plow in after years. If the ground is hard, and they are forced to root on and near the surface, the hedge will fail of meeting the wants or just expectations of the planter. Unless the soil is deep and rich, a trench some three feet wide, and nearly as deep, should be dug on the line where the hedge is to stand, and filled with well-rotted manure, or compost and rich earth. This will involve some labor; but what is worth doing at all is certainly worth doing well; and if the cultivator has not commenced with the design of doing everything in the best manner, now is a good time to abandon all hope and labor, for any other course will only end in disappointment.

Planting the Hedge. This may be done any time after the warm weather commences in the spring. The plants should be prepared for setting, by shortening the roots to within eight or nine inches, and the top to within one inch of the root. Select those of a uniform size as the best to be planted together; stretch a line where the row is to stand, and set out the plants not more than ten inches apart, in a single line, thus, * * * * * or diagonally, thus * * * * * making them a foot apart in each row. To prevent moles from burrowing under the hedge, set the plants three or four inches lower than the sides, so as to leave the ground a little "dishing" toward the row. This is found effectual. The ground should be well cultivated during the season, or if mulched deeply with cut straw, leaves, sawdust or tan-bark, they will require no further attention till the following spring, when the pruning must commence.

Should any of the plants fail to grow, their places should be immediately supplied by taking up from the end of the row, or from a nursery reserved for the purpose.

It is recommended *never* to set the plants further apart than stated above, as at greater intervals the stalks must grow larger, and the roots extend proportionally; besides, it requires much more labor in pruning, for which the saving in plants is by no means adequate.

RAISING CALVES.

Eds. Rural:—I notice an article from the *N. Y. Farmer*, headed A New Method of Raising Calves, tried by D. M. Crowell, for early beef, (that is on sour milk.) That method has been practiced a long time amongst many of our farmers. He says care must be taken not to feed them too much, for fear of forcing their growth. I was not at all aware that there existed any danger of crowding calves on sour milk; but I know, if fed in too large quantities, it will cause them to scour badly. Would it not be more profitable, if the object is early beef, to let the calves for the first two months, suck one-half of the milk of a cow, and then give them the whole amount? If calves were served in this way until from five to six months old, and then weaned, and fed a little meal through the winter, they might be made to weigh from 600 to 800 lbs. apiece. We (my father and I,) are engaged in breeding Devons, and in this way our calves, at five to six months, invariably weigh from 400 to 600 lbs. It seems to me that for early beef, the extra weight, that is from 300, as Mr. Crowell's weighed, would more than repay the extra expenses of letting them suck the cows. We never let calves run with cows, but keep them in a yard by themselves, and let them suck regularly at morning and night.

THE GRAINS AND GRASSES,—NO. 6.

Corn—(*Zea Maize.*)

The varieties of corn are almost without number, and yet these varieties always have some common and clearly defined characteristic which shows their common origin. Those who have traveled in the South West in autumn, will remember the tall Palmetto-like corn of the rich valleys, growing 15 or 20 feet high, with ears as high as a tall man's head, and have contrasted this with the small rice or pop corn of the North, growing not more than three feet high; or perchance he has seen the wild corn of the Rocky Mountains, each kernel closely enveloped in its own separate husk, and growing only two or three feet high. All the gradations, from this up to the majestic corn of the South Western valleys, is filled by corn bearing kernels of all sizes and colors, but each containing the same nutritive principles, though differing some in their proportions, and yielding to man and beast a rich and luxurious food.

In *the cultivation* of corn let the soil be dry and rich, and thoroughly pulverized if possible. Avoid strong, heavy clay, and poor or wet soils. Corn luxuriates in a deep, rich, vergin mould, such as we find in the South-west.

In Western New York the best preparation for corn is to break up a rich clover sod in the spring just previous to planting, not forgetting to haul on it all the manure you have to spare, and if it is fresh it makes but little difference, for a general fermentation takes place before the corn requires their aid. Corn must have the richest soil and careful culture for a large or premium crop.

The selection of seed should always be made in the fall, and with the utmost care, either at the time of husking, or before. Let part of the husk remain attached to the ear, and then braid or tie them up in small tresses or bunches, and hang them up in a dry place, where they will be free from vermin. Those who do not take great care in selecting and saving all kinds of seeds used on their farms, do not deserve the name of farmer.

In the preparation of corn for planting, it is a common practice to steep or soak the seed in some kind of solution; and the best that has been tried, I think, is the following:—Make a strong soap-suds, by dissolving saltpetre in

hot water, and then add the soap till you have a strong suds; soak the seeds from twenty-four to forty-eight hours; then dry for planting by rolling in ashes and plaster—one or both—but ashes are the best. This causes the corn to start quickly, growing with a dark green leaf, and will add from ten to twenty-five per cent. to the yield in ordinary seasons.

Planting. Mark off your ground into rows three-and-a-half feet apart each way, for the medium kinds, or from four to four-and-a-half feet for the larger kinds, and use great care in having the rows straight, as it adds much to the facility of after-culture. Drilling has been practiced to some extent, and is a good plan on soils that are free from grass and weeds; but if the lands are not thus free, it will not pay for the extra care of cultivation. Put from three to five kernels in each hill, and cover lightly with fine soil, and, as soon as you can get a mixture of plaster and ashes, mix them well together—say one bushel of plaster to two of ashes; if the ashes are leached, then mix one to four, and apply a handful to each hill. If you cannot get both, then use the ashes, for it is the best. Apply the unleached ashes before the corn is up, if you can.

Cultivation. Start the cultivators as soon as the rows can be seen, so as to get the start of grass and weeds; and if the operation is frequent and thorough, there will be much less need of the hoe. Hilling should be avoided, except on wet soils. In dry weather, pass the cultivator frequently through the soil, as it will increase the moisture, and is beneficial to all hoed crops. The plow should not be used in corn after the roots have extended far from the stalk.

Harvesting. Let the corn stand till fully ripe before husking, if the stalks are to remain on the ground; but if they are intended for fodder, let them be cut up while yet green, and after most of the ear has become hard. Cut them up before a frost has killed them. If quite green, not more than sixteen or twenty hills should be placed in one bunch. The stalks for fodder in Western New York, will pay more than one-half the expense of raising. Let the ears be secured in narrow cribs, and open, so that there is a free circulation of air through all parts. Let the stalks be well dried before stacking, and then build small stacks, as there is danger of the stalks heating.

The botanical name of corn is *Zea Maize*, found in the class *Monœcia*, order *Tuandria*.

The Chemical Analysis of Corn. But little attention has been given by European chemists to the analysis of corn, from the fact that it is but little cultivated there. Few men are capable of giving a correct analysis of a plant or tree in this country, from the fact that it requires years of labor and patient research to acquire sufficient knowledge, and will not pay the laborer for his time thus spent, for the reason that farmers have not yet been convinced of its practical utility; yet the time, we believe, is coming, when the farmers will be convinced that it is worth some time and money to give their sons and daughters a correct and scientific knowledge of the science of farming.

Dr. Dana gives the following analysis:—Flesh-forming principles (gluten and albumen,) 12.60; fat-forming (gum, sugar, starch, oil, woody fiber,) 77.09; salts 1.31 in each 100 parts, the rest being water. The stalks, when burnt, give of ash about 84 parts in each 1000, and the corn 10 in each 1000. The quantity of inorganic or mineral elements removed by one acre of corn weighing say 5000 lbs., is, of silica 175 lbs.; phosphoric acid ½ of a lb.; earthy phosphates 93 lbs.; sulphuric acid 30 lbs.; lime 14 lbs.; magnesia 5½ lbs.; potash 67 lbs.; soda 62½ lbs.; chlorine 28½.

Marion, Wayne Co., N. Y. I. A. CLARK.

AGRICULTURAL EDUCATION.

Ens. Rural:—I have been much gratified, from time to time, to perceive the efforts which the Rural, in common with many other weekly journals of a similar character, has made to induce our laboring population to acquire a greater amount of education than the majority, in years gone by, have thought necessary to obtain. I have further been gratified to witness through your journal, the efforts of one of your corresponding editors to introduce among his brother farmers, system in their multifarious occupations. In the want of system, I apprehend, lies the failure of our unsuccessful farmers. It is no new saying that a person in order to succeed well in business of any sort must be bred to it. Still it has too often been considered by far too many, that when they have failed in almost every other pursuit, as a last resort they could try Agriculture:—thence the reason we have so many slip-shod farmers, who bring disgrace upon their fellow laborers, mar the beauties of nature, and go grumbling to the end of their days. This want of system will be felt until the youth of our farms are taught, in the acquisition of their education, to acquire such a knowledge as shall lead them to a correct system in all their rural employments.

While we have multitudes of schools in which one may obtain all the necessary ideas to become well versed in Law, Divinity or Medicine, we have scarcely any where the tiller of the soil can investigate the great laws of nature as applied to Agriculture. In order to obtain the necessary knowledge, schools must be established, with farms attached, upon which experiments can be made, the arrangements and planning of a well-ordered farm exemplified. Could the rural youth of our country have their education, or a portion of it, at least, under such circumstances, we would see quite a different aspect from what we now behold.—Instead of capital wasted in cultivating crops upon soils not at all adapted to their growth, the scientific farmer, by being qualified to examine the soil, would be enabled to judge at once to what purpose it should be employed. How much toil and money have been lost in the Great West, for want of a true knowledge of the composition of its soil:—wheat sown upon soil containing scarcely a single ingredient necessary for its full growth and productive yield—lowlands, attempted to be tilled, during heavy rains completely submerged for want of proper draining—repeated failures of crops, from the too frequent use of seeds in the same locality! I need not enumerate further the evils arising from the ignorance of the operator: they are too glaring to be unnoticed.

The remedy has been spoken of above, but how shall such schools be established? Not till the agricultural community feels their importance—not till the idea is exploded that a well-educated person loses caste when he follows the plow—not till the old-fashioned error have passed away who stupidly proclaim a war of extermination upon *book learning*—not till rural occupations are pursued for the pleasure, as well as gain or subsistence.

Your corresponding editor "T. E. W.," in a series of well-written articles, has endeavored to show the benefit of order and good arrangement upon a farm—especially that of having plans fully matured at the commencement of the year; and yet thousands, for want of system and habit, pass by his remarks with but a casual observation. In fact, it is too true that a large portion of those who till the soil, tolerably educated in some respects, do not possess sufficient information in regard to Book Keeping to carry out the plan he suggests. Not one in a thousand who has arrived at the meridian of life without having acquired the habit of noting, from time to time, passing events, will at that time take up the practice. How important, then, that this habit should be acquired in early life! When it shall be considered as proper that a knowledge of accounts and journalizing the affairs of human life should be pursued in our common schools as Grammar or Arithmetic, much will have been accomplished to carry out so desirable a plan as that suggested by "T. E. W."

What is the prospect of the People's College in the Empire State? Is there not energy or capital among the farmers of that State to carry out so desirable a project? It is to be hoped that it will not be left to languish and finally die out. Wm. Blanchard.

Waukau, Wisconsin, 1854.

SODA TO PRESERVE BUTTER.

Ens. Rural:—In some remarks of yours on an article which appeared in the Rural of Nov. 12, you request some one of your readers to try the experiment of using soda to destroy the acids contained in butter, and report the result. As I have seen no such report, I have decided to make one myself, and send it to you to be disposed of as you see fit.

My first experiment being merely for the sake of ascertaining whether the butter would come at all, or not, was made with a very small quantity of cream. As it proved successful, I thought I would try again. Accordingly, six quarts of sweet cream were put into a common dasher churn, and the temperature raised to 58 deg. One tea-spoonful of soda for each quart of cream was dissolved in warm water and poured into the cream while in motion. In about fifteen minutes the butter separated, when the butter-milk was strained off, and water put in its place, and churned until the butter collected. It was then taken out and worked, and set away until the next day, when it was again worked, though there was hardly a particle of butter-milk to be found in it.—Otherwise it did not differ in its appearance from that obtained at previous churnings without soda. I have taken no pains to ascertain how long it would keep fresh, but I think I shall do so at some future time.

As I am not in the habit of experimenting for the benefit of the public, I may have failed to do it satisfactorily in this instance. If so, please inform me through your paper how it should be done, as I am ambitious to do my share towards enlightening the world.

Pine Cottage, 1851. CORA.

Wisconsin Grass Seed.—The Fond du Lac Herald says that Mr. Munger, of Albany, has shipped during the last six months, about 1500 bushels of Grass Seed to the eastern market. Wisconsin Grass commands the highest price in the eastern States, in consequence of its superior quality and freedom from all foul seeds.

Agricultural Miscellany.

PINE WOODS PASTURE AND SOUTHERN COWS.

Hundreds of cows that range in the pine woods of the Southern States, do not give a quart of milk a day, and we have often seen the milking of a cow in a pint cup without filling it. The animals are generally poor, small, scragged creatures, and their calves look like foals of the mother of the woolly horse. It is a common thing that planters with large herds have to buy butter and go without milk. The deficiency is generally charged to the climate. This is not the cause. The truth is to be found in the fact that the natural grass of the extensive pine lands of all the Southern States is almost entirely destitute of phosphate of lime, without which the cow cannot produce abundant milk; her calf cannot grow rapidly, for it gets no bone material.

Don't say, "What fools; why don't they add phosphates to their soil if it is destitute of that important ingredient of fertility?" Look in the glass—see yourself. Look at your own pastures. They may not be as bad—they may be made better.—*New York Tribune.*

We have frequently heard it asserted that the natural grasses of the Southern States "are almost entirely destitute of phosphate of lime," but we have never seen any satisfactory proof of the fact. Will the *Tribune* enlighten us on the point? We do not say that it is not a fact, but if it be one, it is too important, in a scientific and practical point of view, to rest on mere assertion.

A cow could not produce milk *at all* from food destitute of phosphate of lime, and the calf not only "would not grow rapidly without bone material," but it *would not grow at all.* On a soil destitute of phosphates, no plant capable of sustaining life can grow. If it is deficient, the produce will be deficient; *but the proportion of phosphates in the plant will be the same.* We have no proof that, by manuring plants with phosphates, we can increase the relative proportion of phosphates in the plant, while we have abundant evidence that the reverse is frequently the case. Thus, turnips manured with superphosphate of lime, contain *less* phosphoric acid than those manured with sulphate of ammonia; and it is certain that the quantity of phosphoric acid a plant contains is no index of its comparative nutritious value. Were it so, an immature plant would be more nutritious than one perfectly elaborated, the leaves of turnips twice as nutritious as the bulbs, and bran vastly more nourishing than fine wheaten flour; all of which, experience, inductive experiment, and common sense, pronounce erroneous.

PLOWING MATCH IN SCOTTSVILLE.

The first Plowing Match of the season, under the direction of the Monroe County Agricultural Society, took place at Scottsville on Tuesday last, the 20th inst.

Fourteen teams were entered in the first class, and though the ground was exceedingly hard and stony, all the plowmen did their work in a very superior manner.

The premiums awarded in the first class were as follows:

1st. To Joseph Williams, of Henrietta; Williams' double plow—F. Buckley, plowman—$8.00.

2d. Benjamin Warren, Wheatland; Wiard's No. 5 plow—John Ashman, plowman—$8.00.

3d. Franklin Finch, Wiard's No. 5 plow—James Parkman, plowman—$6.00.

4th. Daniel E. Rogers, Wheatland, Wiard's No. 5 plow—Thomas Ingalls, plowman—$4.00.

5th. Samuel Shadbolt, Caledonia plow—Simon Ashman, plowman—Rural New Yorker for one year.

Class 2.—1st. To Geo. W. Goodhue, Wheatland, Hallock's Trojan plow No. 6—Samuel Bend, plowman—$5.00.

2d. John C. McVean, Wheatland, Strouse plow—A. McEva, plowman—$1.00.

Several teams were entered under the third class, (the boys,) but owing to the hardness of the ground, they thought it advisable to postpone their trial of skill to some more favorable occasion.

Taking the nature of the ground into consideration, the plowing was admitted by all to be the best ever witnessed in the country.

Leather for Manure.—Old boots and shoes, and old harness and shoe scraps are first rate manure. They may be eaten up in ashes or lye, or added to the compost heap, or chopped fine and plowed in the soil. Old woolen rags and scraps of wool, hair, skins, all should be treated in the same way.—*Ex.*

They should never be mixed with unleached ashes or lime, for they will drive off the greater part of the ammonia; and it is to the great quantity of nitrogen (ammonia) which these substances contain that their great fertilizing effects are owing.

Butter from a Yearling Heifer.—We learn that an Ayrshire heifer belonging to E. P. Prentice, Esq., of Albany, only seventeen months and three days old, and weighing 550 lbs, produced in the last week in May, *nine and three-fourths pounds* of butter. Her feed was grass only, with the other cattle.—*Boston Cultivator.*

Chickens should be kept in coops, with floors above the ground, until they get strong enough to run at large.

THE RHODE ISLAND HORSE SHOW.

The "National" Horse Show, at Providence, Rhode Island, terminated on the 22d ult. It is said to have been eminently successful, eclipsing that held at Springfield, Mass., last fall.

The following is a list of premiums:

Stallions.—1st premium of $100 for the best stallion of any age, to "Hatchless," belonging to Wm. B. D'Wolf, of Bristol. "Hatchless" is a full blooded Arab horse, eight years old, 15¾ hands high, and of a light chestnut color. 2d premium of $50 to "Louisiana Council," belonging to L. J. Rice, of Washington county, N. Y. 3d premium of $25 to John A. Hammond, of Seekonk, Mass.

Breeding Mares.—1st premium of $40 for the best breeding mare, having had a colt or with foal by her side, to Wm. Goddard, of Providence. 2d, $20, E. Rice, Warwick.

Trotting Horses.—1st, $50, for best trotting horse, to "Lady Litchfield," belonging to Daniel Macy, of Boston. 2d, $30, to "Fanny Jenks," belonging to Adams Carpenter, of Providence. 3d, $20, Wm. H. Greene, Providence.

Saddle Horses.—1st premium, $20, to R. L. Lippitt, of Providence. 2d, $10, E. C. Wade, Providence. 3d, $5, J. D'Wolf, Bristol.

Matched Horses.—1st premium, $30, best span 4 years old or over, Edward Carrington, Providence. 2d, $25, Mrs. Amasa Sprague, Providence.

Family Horses.—1st premium, $50, for the best horse, 4 years old or over, Robert W. Watson, Providence. 2d, $30, John F. Brown, Woonsocket. 3d, $20, Richard J. Arnold, Providence.

Draught Horses.—1st premium, $10, best pair, A. H. Arnold, Coventry. 2d, $5, not awarded. 1st premium, $10, best single horse, O. A. Billings, Providence. 2d, $5, Geo. Hoffman, Pawtuxet.

Colts.—1st premium, $15, best 3 years old colt, H. D. Dean, Mansfield, Mass. 2d, $10, not awarded.

3d premium, $10, for the best filly, N. F. Potter, Providence. 1st premium, $10, best two years old, F. H. Woodmancy, Lisbon, Ct. 2d, $5, Lowell Pilcher, East Greenwich. The premium of $5 for the best filly, E. Spencer, East Greenwich. The first premium of $10 for the best one year old, H. D. Ives, Providence. 2d, $5, not awarded.—The premium of $5 for the best filly, Geo. W. Payton, of Providence.

DESTRUCTION OF BUSHES.

In many places there are grounds which cannot be well plowed that afford tolerable pasturage if not too much occupied by bushes. The shrubs which are inclined to grow in these situations are alders, briers of several kinds, whortleberry, &c. Where these are permitted to grow, they prevent the growth of the grass to a great extent, and make that which does grow sour and worthless.

The mode usually adopted for killing bushes in such circumstances is to mow them. The efficiency of this has been found to depend much on the time of the year in which the work is done. Cutting in winter seems to have little effect toward destroying them; they start with the return of spring and grow rapidly.—The effect is nearly the same as if they are cut while the foliage is developing. All trees and shrubs make their annual growth in a few weeks from the time of putting out leaves.—During the remainder of the season, the wood hardens, and the buds of next season's foliage are set. The juncture when the leaves have attained their full size, and the growth of the season is checked, is sometimes called "turn of the sap." The vitality of many plants is greatly impaired if they are cut off at this time.—But with another species, cutting at another period—the last of August—is more fatal.

The black alder usually grows in moist, rich ground, such as is very natural to grass. From their rapidity of growth they soon occupy the ground to the exclusion of other vegetation, and appropriating the best soil to their use, they occasion much loss. Attempts are often made to eradicate them, which do not succeed, and this produces discouragement, which induces the farmer to allow them to grow unmolested. The results of trials at cutting alders at various seasons of the year have proved that the above mentioned is preferable. We might cite much evidence in support of this; but, perhaps, what we have already said may induce some to undertake the work.

In killing briers and small bushes, bruising sometimes answers better than cutting. A tool called a "bush-whacker" has been used for this purpose.

Briers and whortleberry bushes may be kept down by sheep, after having been closely cut with a scythe. It is necessary, however, to stock heavily in order to compel the sheep to eat the bushes as soon as they start. If the bushes are closely kept down for a year or two, the grass will spread and form so close a sward, on good land, that the bushes will have little chance to grow. It is important that when the work is begun it is followed up. Once mowing may be partly effectual, but if the sprouts are not cut at the proper time the next season, the labor is in a great degree lost.—*Bost. Cult.*

Ashes on Potatoes.—*More Evidence of Value.*—Our readers may remember that Mr. Barret, of Cayuga, published a statement that he and his neighbors had prevented all rot in their potatoes for several years, by sowing ashes over them, at the rate of from two to three bushels per acre, once a week for six weeks, commencing immediately after the second hoeing. Rev. Lyman Smith, of Charlotte, Vt., confirms this statement in a letter to the New England Farmer. He says he has prevented the rotting of potatoes by sprinkling the tops with ashes as soon as they made their appearance, a table-spoonful to each hill; after hoeing, applying the same amount again. The ashes were applied immediately after a shower, or upon a heavy dew. After such applications, he has no rotten potatoes.—*Count. Gent.*

A Hen Doing Double Duty.—We have a motherly old Shanghae hen, that brought out a brood of chickens two or three weeks ago, and is now busily engaged in clucking and scratching among them—coaxing and scolding if they go astray, and spunkling terribly at all the dogs and cats and hawks that show themselves. At the same time she lays an egg every day or two, just the same as if she had no little responsibilities to take care of, and nothing else to do but lay and cackle about it. We call this doing double duty.—*Me. Far.*

Nitrate of Soda.—Mr. Stephenson, of Edinburg, applied one cwt. of nitrate of soda and two cwt. of common salt per acre, to a wheat crop, and increased the yield nine bushels per acre.

PROFITABLE CROP OF RUTA BAGAS.

It is not often that we can record instances of more profitable culture, than the following, as stated by our friend, Cheever Newhall, of Dorchester:

'The land on which the crops mentioned below grew, was poor pasture land, and had not been cultivated for more than thirty years.—It was plowed in the fall, and again in the spring; was well manured, partly with night soil and partly with piggery manure, to which was added a quantity of guano and ground bones,—the cost of the two latter being $6.60 per acre. The first crop (potatoes) grew well, and yielded fairly; were dug early and sent to market. In digging the potatoes, *the tops* were laid regularly between the rows; at the same time care was taken to haul the earth over them, which made somewhat of a ridge.—These ridges were three feet apart. The ruta-baga seed were dropped upon them, nine inches apart, at several times, between July 17th and August 10th. No plow was used after taking off the crop of potatoes. At least one-tenth of the spaces intended for the ruta-baga were vacant, as the seed did not vegetate.—About ten days after the plants were up, the cultivator was passed between the rows; the plants were thinned out, leaving but one in a space, and thoroughly weeded. This is all the cultivation they received.

About the 20th of October, the entire crop on the five acres was sold for *one hundred and fifty dollars*—the purchaser to take them from the ground, where they then were.

The person who bought them says that the produce was more than twelve hundred bushels, and that they were well worth the sum he paid for them. When it is considered that this crop was raised upon land that had produced a fair yield of potatoes, and that *thirty dollars per acre* was realized for a *second crop*, while the expense did not exceed five dollars per acre, I am led to believe that land will sometimes, at least, pay the cultivator a fair compensation for the labor bestowed.—*Practical Farmer.*

PROSPECTS OF THE WHEAT CROP.

The Crops.—It is next to impossible to form an opinion of the coming wheat crop, the accounts bring so contradictory. One week an abundant harvest is looked for, and the next it is all cut off. The Milwaukee Sentinel says there could not by any possibility be a better prospect in that State. The Kalamazoo Gazette gives very flattering accounts of an abundance in that wheat growing region. From Battle Creek, Calhoun Co., we have the same news. An average yield is predicted in Jackson and Ingham. On the whole, taking the country through, an average crop may be expected, according to present indications. In Monroe county we shall not expect a full crop.—*Monroe (Mich.) Herald.*

The Wheat Crop.—The great staple of our county is now in a state of forwardness and health quite equal to that usual at this season. Except in some few localities, where portions were winter killed, the fields look promising, and the prospect for a good yield was never better. It is quite generally headed out, and needs but two or three weeks of good ripening weather to give to the community "flour from new wheat."—*Orleans Republican.*

The Steuben (N. Y.) Courier thinks that the wheat crop in that county the present season will be below the average, probably not more than a two-thirds yield.

A Mammoth Farmer.—Jacob Strawn's homestead in Illinois consists of ten thousand acres. The number of acres of corn he has this year, is twenty-three hundred. This, at forty bushels per acre, a low average yield for the last season, gives ninety-two thousand bushels. The corn fed to cattle is not husked, but is cut up and fed to them on the stalks.—Another farm is owned by the same man, which is six miles long and four broad. Last year he paid out ten thousand dollars for fencing materials. He also has large tracts of unimproved lands. Strawn is an immense dealer in cattle.

Garget.—The *American Agriculturist* says the best remedy for garget is to let the calf run with the cow and suck it as often as possible. The next best is to take the roots of the bitter-sweet—which is common in all our forests—cut them up fine and steep them in hot water, making the decoction quite strong. Pour off this liquid, then mix it half and half with lard, and rub the cow's udder and teats well with the mixture twice a day, and milk her at least three times each day.

Immense Loads of Wheat.—On the 13th instant, Mr. William Pluto, son of John F. Pluto, Esq., residing about two miles east of this village, drew from home and delivered at the mill in this village, at one load, with one pair of horses, and upon a common lumber wagon, 138 20-60 bushels of wheat, for which he received the sum of $311,25, for, two dollars and twenty-five cents per bushel. We think this will be hard to beat. Who can do more?—*Batavia Dem.*

To Cure Founder.—The Ohio Cultivator gives the following recipe for curing the founder—more correctly speaking the water-founder:—"Bleed the horse from the neck as long as he can stand up; then make him swallow one pint of salt; anoint well around the edges of his hoofs with spirits of turpentine; keep him from drinking too much water, and he will be well in a few hours."

Onion Eaters.—Some inquisitive physiologist has been investigating the effect of onion eating on the human system. He states that raw onions are much the same in their effect as opium eating, producing a dull, stupid, drunken feeling, that renders a person unfit for labor, reading, or anything but lazy, indifferent repose and lassitude.

Orchard and Garden.

SCRAPING AND WASHING TREES.

The Mass. Hort. Society have published a report adverse to the practice of "scraping and washing trees," so generally recommended by our leading authorities on the subject. A committee was appointed to inquire into its "uses and abuses," and after a thorough examination, they came to the following, among other conclusions, which are well supported by arguments:

1st. The scraping off the outside bark of fruit and ornamental trees, and washing and plastering them with lime and other preparations, in the hope of benefiting the trees by the destruction of parasites and insects injurious to vegetation, and of improving their general appearance, is declared to be of no advantage to the tree, (1) from its inability to affect the majority of insects which are really injurious; and (2) unnecessary in the case of lichens and mosses, they being not the cause but the consequence of disease and decay; and (3) a positive violation of the laws of vegetable physiology, and, consequently, an injury to all trees, (but to ornamental ones in particular.)

2d. Lichens and mosses, in a healthy state of the tree, are, as far as can be ascertained, no injury to the bark, but from their varied colors form one of its cheapest ornaments.—Any operations for their removal are both unnecessary and injurious.

3d. As bark-lice, woolly aphis, and some borers lay their eggs and hatch their young upon the bark of apples, pears, peaches and maples, near the ground in the forks of the branches, a gentle rubbing with some pliable but stiff wire or other brush on the parts affected, to be followed by a washing with weak, soft, or whale oil soap suds, is desirable, and will be of benefit, if the insects are really present, but if they are not clearly so, it should not be permitted, as it is both costly and useless.

Another resolution denounces the use of alkaline washes or preparations as injurious.

The Report is drawn up by R. M. Copeland, and its conclusions are endorsed by Geo. B. Emerson, the learned author of the Trees of Massachusetts, and by Mr. Sucksmith, who has made the subject of Lichens his particular study. We thus notice them to call out the experience of our readers on the subject. For ourselves, our trees have never been scraped or washed, so we know nothing of the benefits of the practice.—n.

GENESEE VALLEY HORTICULTURAL SHOW.

The summer exhibition of the Genesee Valley Horticultural Society, took place at Rochester, on Saturday last, June 24. The show of Roses, Cherries, and Strawberries, was exceedingly fine. Ellwanger & Barry exhibited 224 varieties of Roses, 33 of Strawberries, 16 of Cherries, together with a fine collection of Peonies, Phloxes, &c.

A. Frost & Co. exhibited a fine collection of green-house plants, together with 247 varieties of Roses, 2 of Gloxinia, 18 of Gooseberries, &c.

Samuel Moulson exhibited a very choice collection of Roses, containing 110 varieties.

John Donnellan & Nephew, J. C. Ryan & Co., Bissell & Hooker, A. Looms, of Byron, and several other nurserymen exhibited largely.

In the amateur list, J. A. Eastman, of Rochester, exhibited 68 varieties of Roses. D. C. Greenleaf, of Brockport, a fine collection of Roses, Lettuces, Gooseberries, &c. The latter were the finest on exhibition, and entirely free from mildew. Mr. G. informed us that he prevents the mildew by simply dusting the trees, when the dew is on, with dry wood ashes.

Mrs. E. Jenks, of Rochester, exhibited two beautiful specimens of wax flowers.

C. F. Crosman and F. Backus exhibited some fine vegetables.

Many other exhibitions deserve honorable mention, but our space forbids.

Hints to Beginners.—In an excellent article under this heading in the June number of the *Horticulturist*, its able editor, Mr. Barry, points out many faults which young and enthusiastic beginners are most liable to fall into.—Don't try to eclipse in a single season all that your neighbors have accomplished in years.—Choose a *small list* of fruits, such as are noted in your district for their thorough adaptation to its soil, climate, &c. Eschew new sorts, no matter how imposing the name, or how tempting the description. On all points much may be gathered from books, but, after all, we must study our own trees before we have knowledge applicable to our wants and circumstances.—We would our space allowed us to extract more of these excellent hints. The whole article should be carefully perused by all beginners.

We are indebted to O. C. Ross, of Penfield, N. Y., for some fine cherries, produced by grafting a *Black Tartarian* on a *Yellow Spanish* stock. The cherries are large, beautifully mottled, and of good flavor.

HAMPTON'S RARERIPE PEACH.

This new peach was produced from a stone of the Morris White Rareripe, purchased in New York city sixteen years ago. The stone did not germinate until the second year, when the produce was a tree of uncommon vigor. It was several years in coming into bearing, but has not disappointed expectations since that period.

The fruit is of very large size. Some specimens have measured eleven and three-quarter inches in circumference. It parts freely from its drab stone. In quality, it is of the very finest, being very sweet and rich;—in these respects surpassing all peaches within my knowledge. The time of maturity is the first of September, and ripens gradually for two weeks. The tree is of great vigor; and before it suffered severely (a few years since) from a sleet storm, the extent of its branches exceeded 29 feet in diameter, the circumference of its body 30 inches, and some of the annual rings exposed by this injury were near an inch in width. It is proper to state that this tree stands in an uncultivated soil. The blossoms of this fruit are small and pale; the leaves finely serrated.

Dudley, Hardin Co., Ohio. WM. C. HAMPTON.

GATHERING SEEDS.

From the practice which I know to be quite prevalent, of farmers depending upon the seedsmen for their annual stock of garden seeds, (or perchance their more patient and careful neighbors,) I judge that gathering seeds is considered a perplexing and tiresome operation. When the farmer saves his own seed he knows it to be of a certain kind, he knows it to be good and fresh, and is consequently never subjected to the inconvenience of sowing seed which will not grow. The smaller kinds of seeds, and all such as grow in pods or balls which open of themselves when ripe, and scatter their seeds, are the most vexatious, and yet with a little care may be saved with less trouble than any other. This may seem paradoxical, but the modus operandi is on this wise. When the seed is ripe and just scattering, and the plants are dry and clean, take a common dust-pan, and holding it underneath one side of the plants, bend them over the duster with the other hand and rap them, and the seed will fall out clean and free from any of the pods or chaff. Portulacca, and many of the smaller flower seeds, I have found it difficult to save in any other way, but in this way I get the best of the seed and perfectly clean. If much seed is required, and it is not sufficiently ripe at one time, the operation may be repeated without injury to the plants, but usually the amount of seed of any one kind which a family garden requires may be saved by a single operation.

West Bloomfield, N. Y., 1854. W. B.

Mulching Gooseberries.—An article is going the rounds of the papers, showing the advantages of mulching gooseberries—that it is a remedy for mildew, &c. Now, we would say to the writer of that article, and to those copying it, as well as every reader of it, that it is necessary to the successful cultivation of small fruits, *that they should all be mulched*—the gooseberry, the raspberry, the blackberry, the currant, and even the strawberry—the latter with tan. To attempt to cultivate small fruits without mulching, will assuredly fail, after the first year or two, as we have found to our cost; but *with* careful, repeated mulching—it matters little what the material is—it will be next to impossible to fail, provided, of course, that the other necessary attention is bestowed.—We don't know what a mildewed gooseberry is, since adopting this method, and propagating the English Silver Vanity, (we believe it is called.)—*Mr. Farmer.*

Flowers.—A few—if only a very few—should be about every farm-house. They are pleasant to the children and to the traveler as he passes; and it will promote your own happiness to see others happy.

AN ORCHARD DISEASE.

A correspondent of the Maine Farmer, who writes from Hampden, describes a disease with which his orchard is infected. He says his trees look most beautifully in the fore part of the summer, until the apples become about the size of robins' eggs, when a kind of black mould or blight seizes upon them and spreads over them, most effectually putting a stop to the growth wherever it prevails. One side of an apple touched with it will be black and scabby, and open with two or three large cracks, while the other side of the same apple will continue to grow, and be fair and handsome. In some instances I have known the entire fruit of a tree to be covered with this black malady, the fruit of all sizes from that of musket balls to that of hen's eggs with the exception of perhaps two or three near the ends of limbs, which were stretched away off remote from the body of the tree; these would be large, fair and handsome, showing what others would have been if they could have had their own way about it. He says that for the last seven or eight years he has had apples enough in number, if unmolested by this disease, to amount to some 600 bushels a year on an average, instead of which he has got but about 150 bushels, two-thirds of them hardly fit for the hogs to eat. He has sometimes observed it on the leaves of the trees about the time the fruit is attacked. The same phenomenon appears, whether his trees are old or engrafted. The editor of the Farmer says the disease is entirely new to him. It is not new to us, for we have known the fruit of particular trees infected with this disease from our earliest recollection of playing under the apple trees. We have generally attributed the effect to some peculiarity of the variety, but in most instances which we now recollect, the heart of the tree was dead and water-soaked.—*Farmington Chronicle.*

Shortening-in Lima Beans and Squashes.—The *Granite Farmer* states that clipping the shoots of Lima beans, when about six feet high, produces an abundant crop, the beans ripening in August. Squashes, the vines of which were nipped after two or three squashes had formed, were larger and ripened better.—By cutting out the early bearing branches, a succession of squashes was obtained through the summer. Tomatoes which grew on an excessively rich piece of ground were benefited by shortening, new and more vigorous shoots successfully pushing out in place of those which were clipped.

A Phenomenon.—There is, on the farm of Sylvester Cummings, Esq., of Boxford, a sweet-apple tree that has this season presented a very singular phenomenon. In a branch covered with the usual foliage and blossoms, there is at its extremity a cluster of four blossoms resembling the rose; the color white, but rather larger than the common variety. Its perfume is similar to that of the apple-blossom, and it has been in bloom upwards of a fortnight, and a few days since it was as fragrant as ever. The tree has attracted considerable attention from its singular appearance.—*Boston Cult.*

A New and Beautiful Tree in Oregon.—A Mr. Brooks, writing from Olympia, Oregon, says:—"A strange and beautiful tree has lately been found here, which is from one to seven feet high, with a leaf resembling that of the pear, and the trunk and branches those of the orange. The upper side of the leaf is coated with gum, of the consistence of oil, and it is highly fragrant, the odor resembling that of bergamot or ripe fruit. It will be highly ornamental and a desirable addition to our gardens, as it is an evergreen."

Saffron.—On Wednesday last, Mr. Richard Greaves, farmer, near Northwood-heath Gate, parish of Kings Norton, turned sixteen cows into one of his meadows, where a quantity of saffron grows. All the animals were immediately taken ill, and eleven died in the course of the same day.—*Worcester (Eng.) Chron.*

A correspondent of the Gardeners' Chronicle, says:—"Every one finds great difficulty in keeping garden seats more than a year without constant painting. Gutta-percha thinly laid on, and turned round the sides and nailed, will last forever; it looks garden-like, and costs no more than one painting."

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending June 20, 1854.

Edwin Allen, of South Windham, Conn., for improved veneer polisher.

Gabriel Blondin, New York, for improvement in processes for treating paint.

Gabriel Blondin, New York, for improvement in paint compositions.

Jos. Bone, Warrenton, Ohio, for improvement in grain winnowers.

Chas. J. Harris, Holyoke, Mass., for improvement in producing continuous circular from reciprocating rectilinear motion.

Nathan Johnson, Noblesville, Ind., for improvement in the mode of moulding bricks.

Anson Merriman, Middletown, Ct., for improvement in steam engine regulators.

Charles Parker, Meriden, Ct., for improvement in cast iron vises.

S. Brockway Robinson, Oswego, for machine for drying grain.

Jos. R. Winchester, Medina, N. Y., for improved mode of raising and letting fall carriage tops.

Luther Hill, Stoneham, Mass., assignor to himself and Lorenzo Stratton, of Feltonville, Mass., for improvement in machinery for cutting out boot soles.

IMPROVEMENT IN FARM MACHINERY.

J. J. Thomas, in his work on Farm Implements, just issued by the Harpers, thus speaks of the improvement of Agricultural Machinery, and the advantages which would accrue to farmers from a more intimate acquaintance with mechanical principles:

"The improvement of farm machines and tools within the last fifty years has probably enabled the farmer to effect twice as much work with the same force of horses and men. Plows turn up the soil deeper, more evenly and perfectly, and with greater ease of draught; hoes and spades have become lighter and more efficient; grain, instead of being beaten out by the slow and laborious work of the flail, is now showered in torrents from the thrashing-machine; horse-rakes accomplish singly the work of many men using the old hand-rake; twelve to twenty acres of ripe grain are neatly cut in one day with a two-horse reaper; wheat drills, avoiding the tiresome drudgery of sowing by hand, are materially increasing the amount of the wheat crop; while a few farmers are making a large yearly saving by the application of horse-power to sawing wood, churning, driving washing-machines, and even to ditching. A celebrated English farmer has lately accomplished even more; for, by means of a steam engine of six-horse power, he drives a pair of mill-stones for grinding feed, thrashes and cleans grain, elevates and bags it, pumps water for cattle, cuts straw, turns the grindstone, and drives liquid manure through pipes for irrigating his fields; and the waste steam cooks the food for his cattle and swine—all this work being performed in a first-rate manner.

Now these improvements were mainly effected through the knowledge of mechanical principles, and many of them would doubtless have been sooner achieved and better perfected if these principles had been well understood by farmers; for, constantly using the machines themselves, they could have perceived just what defects existed, and, by understanding the reasons of those defects, have been able to suggest the remedies in a better manner than the mere manufacturer. Moreover, as the introduction of what is new and valuable depends greatly upon the call for them, farmers would have been prepared to decide with more confidence and certainty upon their real merits, and thus to increase and cheapen the supply of the best, and to reject the worthless.

One great reason that farm implements are still so imperfect, is, that the farmers themselves do not fully understand what is needed, and how much may be yet accomplished.—They have not enough knowledge of the principles of mechanics to qualify them for judging of the merits of new machines; and, being afraid of imposition, often reject what is really valuable, or else, being pleased with a fine appearance, are easily deceived with empty pretensions."

COOLING SODA WATER.

A. M. Dento, of Columbus, Ohio, has made a very useful improvement, in the cooling of liquors, such as soda water, whereby considerable ice is saved. It consists in the arrangement of a single-flued copper chamber, inside of a non-conductor similar to an ordinary water cooler, and placing the whole apparatus upon the counter instead of under it. The ice being placed in the flue (which is of sufficient capacity) keeps the soda water always cold at the place where it is drawn. The stop-cock inside of the non-conducting chamber, is attached to the cooling chamber on one side, and the exit pipe on the other,—thus drawing every glass of soda from immediate proximity to the ice. The saving of ice in the use of this improvement is said to be nearly 62 per cent. over any other mode, twenty pounds being amply sufficient to run a fountain any day during the season. To those who do not continually draw soda, and to whom saving ice is any object, this apparatus is no doubt a valuable acquisition.—*Sci. Am.*

New Churn.—Ransom Markham, of Caledonia, N. Y., has made an improvement on churns which consists in making the bottom of the dasher with a series of angular recesses for forcing the cream towards the sides of the churn, causing it to rise and roll upon top of the dasher as it (the dasher) is lowered. The dasher has also two valves which open as it is raised, and allow the cream which was forced through the angular recesses upon the top of the dasher, to escape and pass under the bottom of the dasher ready for the return stroke. Measures have been taken to secure a patent.—*Sci. Am.*

LEAD TUBES AND CEMENT TUBES.

Lead is very extensively used for aqueducts, and yet many who wish to have water conveyed to their dwellings and out-buildings, are afraid to use it. Its durability—the ease with which it is bent into any direction to accommodate curvature, render it valuable for this purpose, and perhaps, in a mechanical point of view, nothing better could be obtained. The great drawback to its use is the danger which accompanies it, of its becoming corroded or dissolved by the water, and thus poisoning the water conveyed in it, and rendering it unfit for use. Although pure water would not act on lead, and render it poisonous, (for all the solutions of lead are more or less poisonous,) yet every fountain is liable to become impure, to have some kind of saline matters incorporated with it, and thereby give it the power of acting on the lead, and causing the water to become deleterious to health. For this reason other material has been sought for, from which to manufacture tubes, or piping as it is sometimes called, for this purpose.

Gutta Percha has been adopted in many instances for this purpose, and found to answer very well, but its durability is yet a matter of experiment. Hydraulic cement has been tried, and although not so easily manufactured and bent about as lead, can nevertheless be made cheaper, will be very durable, and is not poisonous in any way. Various plans and methods have been adopted and recommended for the purpose of making piping of this kind.

The most recent plan that has come to our knowledge, is a patent taken out by Messrs. T. B. & W. F. Prague, of Piney Hill, near Buckbridge, Va. The Farmers' Journal for this month has some remarks upon this invention, by which piping is made of Hydraulic cement, and states that this pipe has been found by trial in that neighborhood to be very superior. The writer says that after the ditch is dug, the piping is laid down with great rapidity, as it is made from the mortar.

Where the perpendicular pressure is not great, it can be used at once, and in all cases, after hardening a few weeks. The piping, of course, gets harder and stronger with age, until it becomes as hard as rock itself.

One bushel of cement will make six yards of piping, of one and a half inch bore.

The advantages of this piping are enumerated as follows:

1. Its superior durability, lasting forever, while others rust or wear out in a few years.

2. In conveying the water perfectly pure, without poisoning it like lead, or discoloring it like iron.

3. Its greater cheapness, ordinary piping not costing half as much as that of iron, or lead. It is even cheaper than wooden pipes.

We think that the above advantages are very important ones, and we should like to see a trial of the invention made in Maine.—*Me. Farmer.*

Singular Cause of Death.—Miss Eliza A. Sawyer died at Valatie, N. Y., last week, from the effects of poison, communicated to her system by some yarn, which she placed in her mouth, and which came in contact with a sore.—*Ex.*

Some colors are dyed with arsenic. Thus the beautiful light sea green on cotton, is dyed with arsenic, sulphate of copper, and caustic alkali. The yarn of this color is poisonous.—*Sci. Am.*

Domestic Economy.

To Keep Away Ants.—Spirits of turpentine placed in their way, or placed around sweetmeats, will effectually intercept these troublesome insects,—it must be kept up for two or three days. It will also remove the striped bug from vines, by wetting a string and placing it around the hill.

Johnny Cake.—1 pint of sour milk, 1 egg, 1 spoonful of molasses, 2 spoonfuls of wheat flour, Indian meal sufficient to make a light batter, 1 tea-spoonful of saleratus, dissolved in warm water.

French Rolls for Breakfast.—1 pint of flour, whites of 3 eggs, table-spoonful of butter, 2 large spoonfuls of fresh yeast; milk enough to make it stiff dough. Let it rise over night.

Cake Yeast.—Take a spoonful or two of brewer's or distiller's yeast, or if it can be had, a yeast cake left from a previous supply, which should then be thoroughly dissolved in a little water. Stir this into a pretty thick sponge of flour and warm water, and let it stand till night. Boil a handful of hops down strong and strain, stir in flour while boiling hot, till you have a stiff batter, let this cool to blood heat, then stir in the sponge and let it stand till perfectly light, when Indian meal should be added, enough to make stiff dough. Roll it out, cut into cakes half an inch thick, and lay them on a board and dry about ten days, in the shade, turning them each morning. Keep them hung up in a close bag and they will remain good for years. A little boiled potato improves the sponge.—*Ohio. Cult.*

Mildew Stains—Are very difficult to remove from linen. The most effectual way is to rub soap on the spots, then chalk and bleach the garment in the hot sun.

Tomato Sauce.—Peel and slice twelve tomatoes, picking out the seeds; add three powdered crackers, pepper and salt to your taste; stew twenty minutes.

Use hard soap to wash your clothes, and soft to wash your floors. Soft soap is so slippery that it wastes a good deal in washing clothes.

Educational.

[Written for Moore's Rural New-Yorker.]

SCHOOL HOUSE SITES.

One of the greatest errors in the erection of School Houses, is the selection of the proper sites. In the first place, they are almost universally too small, and very often chosen without any regard to adaptation to the purpose for which they are to be employed. Frequently they are located in an angle where two roads cross, so that a considerable portion of the unfenced "lot" belongs rightfully to the "Public," and that important personage generally usurps the right to complete the triangle, by making a hypothenuse in the shape of a carriage-way, across from one road to the other. By the time this is done, and a School House, small though it be, erected, it is seen that the "lot," diminutive at first, has grown "smaller by degrees and beautifully less." The only play-ground is the triangle aforesaid, whose dimensions we must ascertain as in other irregular solids, by its loss of weight in water, for it is generally surrounded by, sometimes submerged in that liquid, which is always "as clear as mud."

The School House is as narrow and limited as its builder's knowledge of physiology. It is without any provision whatever for ventilation, and the benches are constructed in the best possible form for sowing the seeds of consumption. And here, with a poor stove and poorer wood, is installed the teacher, who is expected to bar the door against ignorance and vice, or rather to eject them after their entrance. Here with forty urchins, "more or less," of all ages, classes and conditions—"black spirits and blue, green spirits and gray"—here, in this heterogeneous mass, he is expected to bring order out of chaos—to build upon this basis a temple of knowledge, glorious as that of King Solomon of old, and that too "without the sound of any tool whatever." Here, under these adverse circumstances, he is expected to make great advancement up the ladder of learning—rapid strides up the hill of science—to make giants in intellect—prodigies in morals—to give to each a sound mind in a sound body. Utopian scheme! vain hope! As well may we expect the triumph of temperance principles when men are licensed annually to retail liquid death! As well may you expect that the poor in your community are supplied with food and raiment, because you have said to them, "Be ye clothed and be ye fed," and at the same time have "shut up your bowels of compassion."

And yet this educational disease, though chronic, is not incurable. In fact it suggests its own remedy. Large and well chosen sites—natural groves, when they are to be obtained, when these are not to be had, ornamental trees should be planted; flowers, plants and bushes cultivated; walks laid out, together with large and commodious play-grounds for healthful exercise. The building should be large, with a high ceiling,—provision should be made for thorough ventilation, not a mere lowering of the windows,—it should have a cellar under the whole of it, for storing wood, and for a furnace, by which it might be thoroughly and evenly warmed. Then, with good teachers, good books, and good apparatus, we might reasonably hope to see scholars, mentally, morally, and physically educated, and fitted to act their part in the great drama of life. We believe that the "good time" at which we have hinted, will yet come. Already we behold the dawning of a brighter day—may we soon bask in its noontide effulgence!

East Varick, N. Y. B. R.

EVENING SCHOOLS.

The following extract from the Annual Report of the Superintendent of our city Schools R. D. Jones, Esq., illustrates forcibly the advantages to be derived from the establishment of evening schools, as auxiliary to the day school, for the purpose of disseminating the blessings of education among that class of persons who have neither the time nor the ability to devote the day to purposes of intellectual culture; to these the value of the evening school is inestimable:

Seven teachers, on an average, were employed in the Evening School, which closed on the 27th of February, having been taught four months. The amount paid for teachers for this school, was $564. Other expenses, including gas fixtures, gas, &c., about $311, making the expenses of the evening school, $875.

The whole number of scholars that attended the evening school, was 400. Average attendance, 250.

The experiment of establishing an evening school, has proved eminently successful. At the commencement, it was doubted by some whether there would be a sufficient number of scholars disposed to attend, to occupy the time of one teacher. Almost immediately, it was found that one teacher could not successfully teach all seeking admittance, and other teachers were employed. The number of pupils regularly increased, until the several rooms in No. 1, the house occupied, were filled to their utmost capacity. At the close of the school, there was a less number of scholars in attendance, owing to the fact that some of them had become so situated that they could attend the day schools; others were engaged in occupations rendering it more difficult to attend.—There was no abatement of the interest felt, and those who left, except those who had become so situated as to enjoy greater advantages, universally regretted the necessity of withdrawing.

The good done by the evening school cannot be estimated. Those in attendance were an interesting class of our population.

They were young persons whose circumstances compelled them to labor through the day, and they were engaged as clerks, apprentices, journeymen, &c. A large number were foreigners, some of whom, at the commencement of the school, could not read, nor scarcely speak a word of English. They commenced with the alphabet, determined to know something of the rudiments of the English language. They lost not a moment by idleness or inattention, and at the close of the school, many of them could read with considerable facility. They learned the first principles of the language, and judging from their often expressed gratification and zeal, they will continue when away from school to employ their leisure time in study. Others speaking no language but their own, were scarcely less advanced in the rudiments of education. The evening school afforded them opportunities never before enjoyed, which they diligently improved, and seemed highly to appreciate. Reading, spelling, writing, geography, and arithmetic, were the principal branches taught. A few, whose advantages had heretofore been better, pursued a higher class of studies.

Aside from the intellectual culture, and the moral training received by the attendants of the school, its effect in withdrawing this portion of our juvenile population from temptations to evil, is a consideration of no small moment. A majority of the 400 scholars registered in the evening school, had they not been in attendance upon it, would have spent their evenings in the streets, and at various places of resort, where evil, and only evil, would be learned. The better faculties of their nature would be crushed out by the vicious examples around them, and the seeds of vice allowed to become so strongly rooted, that it would be next to impossible to eradicate them, and plant a desire for virtue and intelligence.

In a city like this, there will always be persons of school age situated like those mentioned, unable to attend a day school, and yet willing and anxious to learn, and it is most devoutly to be hoped, that those who shall succeed the present Board, will follow the example so auspiciously commenced this season, and provide evening schools for all, otherwise deprived of educational facilities, who can be induced to attend them. If the present Board has taken advance steps in the cause of education, the establishment of the evening school must be regarded as the noblest of them all.

TEACHERS' INSTITUTES.

The history of these institutions in our State is full of instruction. A law was passed in 1847, appropriating sixty dollars to each county in the State, on its compliance with certain regulations. Prior to that, they had been held with the best of success in a large number of counties. But the abolition of the office of county superintendent, and the excitement incident on the passage of the free school law, had a tendency to detract from their interest and usefulness. Another cause of their decline was the difficulty of securing competent men to conduct them. All of these influences would have been counteracted, however, if teachers themselves had kept up their interest. The flagging of their zeal was the real cause of the decline.

But a new interest is springing up. Teachers have done much within the last two years in advancing their cause; and now, are they not ready to revive institutes? The legislature have made the appropriation for the ensuing year, and will undoubtedly continue it if the money is well used. Now is the time for action. A bill was passed in 1847, and upon which the present appropriation is based.—Though its provisions are quite stringent, they can be followed to the letter, if the proper effort be put forth.—*N. Y. Teacher.*

THE COCHINEAL.

[THE COCHINEAL.]

The Cochineal or Commerce has the appearance of a seed or grain; and few persons who are unacquainted with the natural history of the article which is the principal ingredient in all of our most brilliant dyes, would, on inspection, believe it to be a member of the animal, instead of the vegetable kingdom. But so it is, and millions of pounds of these minute insects are reared and sacrificed, made an important article of commerce, and sold in the various marts of the whole civilized world, in order to gratify the eye of man.

Two members of the lower animal creation play important parts in ministering to human luxury and pride, viz., the silk worm and the Cochineal fly;—the former in spinning the thread of all our most costly textile fabrics, and the latter in giving them their brilliancy of hues, from the flaming scarlet, the brilliant orange, and the blushing crimson, to the delicate pink, and the pale-tinted rose. All these colors, in their infinite variety of shade, as well as all others where a tinge of red enters as a component, are made from Cochineal.

The insect is obtained from Mexico and the neighboring countries, and is raised on a tree of the Cactus family, on the juice of which it feeds. When the insects are properly matured, they are killed by pouring over them boiling water, or by roasting them on plates of iron. After being thoroughly dried, the insect is packed for the trade. Immense quantities of this dye-stuff are used, both in Europe and the United States, in silk and carpet manufactories.

The belle who, in a five hundred dollar shawl of Canton crape, promenades Broadway, captivating the hearts and turning the heads of fools and coxcombs by the magnificence of the display, does not, perhaps, know enough of natural history and the mechanic arts, to understand that all the costly paraphernalia is manufactured out of the shroud of a crawling worm, and dyed with the life-blood of an immolated bug.

Useful Olio.

PHILOSOPHICAL LECTURES.

You have all observed, I have no doubt, boys, your mothers' tea-kettle boiling on the hob. Before it arrives at the boiling point, how it sings, and shakes, and sighs, as if some demon-spirit was confined within, and was striving to get loose. It is a curious performance, and many of you have speculated upon the cause. The steam is generated from the water in contact with the hot metallic surface; and then as it rises towards the surface, is condensed by the water above not yet raised to a boiling point. This produces a partial vacuum, and is the cause of the commotion in the fluid. Look at this glass flask, under which I have set a spirit lamp; see how the bubbles rise to the surface as the water boils, and look at the white cloud which you call steam, as it rushes out of the tube. Close down to the mouth of the tube you can see no steam, but as it passes further and further away, the column of vapor grows larger and whiter, until it forms a cloud, and then scatters and mixes, and becomes invisible in the air. Is it lost, do you suppose? Is the water I have boiled away destroyed or annihilated? No; it has only changed its form, and passed off into the atmosphere in the form of vapor, from whence it will return again to the earth in the shape of dew or rain.

The cloud of vapor which you see issuing from the tube—the spout of a tea-kettle, if you please to call it such—is not steam after it becomes visible, but water in minute particles. Steam is as transparent as air, and can no more be seen than air. If a locomotive boiler could have a shell of glass, we could see inside, above the water, only what appears to be an empty space; and yet there would be a body of steam in that apparently empty space, so densely compressed, that it requires *seventy pounds* on every square inch of the boiler shell to confine the steam. If the iron plate of which the boiler is composed should prove weaker than that, it would be torn to rags, killing and wounding all within its reach.

You see this hollow iron ball. If I should fill it half full of water, stop up the orifice, and then throw it into the stove, it would be blown to pieces, as it would be by so much gunpowder. It would not be necessary for us to seek egress at the doors or windows, for there would be none left in the room, nor would there be any occasion for us to repeat the philosophical experiment. Steam is a potent agent for the execution of human purposes, but it is a demon that must be bound in strong fetters; but the stronger they are, when he does break them, then the more terrible will be the slaughter he produces. It is an excellent servant when kept under control, but confined in fetters which it can snap asunder with the exertion of its wonderful strength, it scatters death and destruction in all directions. The caution which one of our poets gives when assuming to speak for steam, is truthful to the life:

"But harness me down with your iron bands,
Be sure of your curb and rein;
For I scorn the strength of your puny hands,
As the tempest scorns the chain!"

At the sea shore women bathe by themselves; they are clothed with a long robe which conceals them from their own looks; but in the evening you encounter at the balls, these same women, just sufficiently covered to cause the remark how little they are covered; so that they have the appearance of dressing to go to the bath, and of undressing to go to a ball.—*Monitor of Fashion.*

INCIDENTS OF TRAVEL.

Eds. Rural:—Incidents of travel upon the great thoroughfares of our country, have furnished ample themes for the "pen of the ready writer," until now there is scarcely a city, thriving village, or enchanted spot to be met with upon the line of a railroad, navigable river, or canal, but what has, in fancy, been repeatedly placed before the gaze of all newspaper readers in the country, and thus become to them almost as "familiar as household words." In complying with a request of yours, on leaving the dust and noise of the city, to transmit to you occasional notes of travel, I will not "bore" your readers with a lengthened account of everything that drew my attention at the far-famed Falls of Niagara and vicinity—what might be said of a trip through on the Great Western Railroad, passing through Her Majesty's Dominions from Niagara Falls to Windsor, opposite Detroit, nor yet what cannot fail to interest the eye of every traveler who passes through on the M. C. R. R. to Chicago. Literally, there is "nothing new under the sun" to be said about these oft-frequented routes, and their associations.

Remaining at the city of Chicago for a few days, gave me an opportunity to witness how business is done in this great emporium of the West. Without the hurry and hustle usually attending the transaction of business in many of our Eastern cities,—implicitly obeying the old adage, "haste slowly,"—every movement indicates the transportation of heavy burdens. I could but think, while walking the thronged streets, and seeing the teeming population, how grand is the thought that here, *upon the very roots of the primitive forests*, has suddenly sprung up a vast metropolis, whose pulsations are felt to almost the farthest verge of our continent! With her commerce upon the waters, her railroads, her internal resources, and the fine rich country around, Chicago is destined to have few rivals among us.

Taking the steamboat at evening, the next morning we were safely moored in the harbor of Grand Haven, at the mouth of Grand River. We were not long in stepping from the cabin of the Pacific to that of the little river steamer Michigan, and soon were plowing the smooth waters of the river. The width of the stream gave a fine opportunity to view the scenery upon both sides. The boughs of the beech, maple and elm skirting the shores, bent down as if to embrace the bright glassy waters; and the dense foliage, with its variety of hues, changing from time to time by the gentle winds and glancing sun-light, possessed a richness, a luxuriance, I never remember to have witnessed before. To one who, during the long, dreary winter, had been shut in by high walls of brick and mortar, you can well imagine how enchanting was the scene all along the river course.—Occasionally, upon the sloping bank, is to be seen a little quiet village, with its church and school-house, and many indications of improvement and growth. At night-fall we arrived at the little city of Grand Rapids. This city, with us, would be honored with no higher appellation than that of a village, notwithstanding it has its Charter, Mayor, Aldermen, &c. It numbers nearly 5,000 inhabitants, and is rather pleasantly situated at the rapids of Grand River, which are about a mile in length. With its fine fruitful country around, its immense water-power, and facilities for communication with larger cities on the lake coast, it will doubtless, in process of time, become no inconsiderable city. Navigation is quite as effectually stopped here, as at the rapids of the Sault St. Mary's, and a Sloop-canal was contemplated and partially built around the rapids, but for want of means, or some other as good reason, has been abandoned.

Stepping on board another little steamer, above the rapids, we passed through the midst of as fine scenery as the day before, and what, with slow sailing and occasional stopping along the shore, "to take on" and "let off" passengers, it was nearly night when we arrived at Ionia. From this place you may hereafter hear from me again. S. A. E.

Ionia, June, 1854.

The Seventeen-year Cycle.—The seventeen-year period is one of the most important in the animal world. Epidemics are known to occur at this period, the cholera being one of these. In 1816-17 it commenced its ravages in India; it was prevalent in Europe in 1832-33, and again in 1848-49. Humboldt mentions a similar cycle as having been observed in South America, in the prevalence of the small-pox. In the United States locusts have appeared every seventeen years in large quantities, concurrently with the epidemical diffusion of cholera, namely, in 1832 and 1849. There is a species of *Cicada* which has its trivial name from its periodical recurrence at this interval of time, the *C. septemdecem punctata.*—*Quarterly Review.*

Prepare yourself for the world, as the athlete used to do for their exercises; oil your mind and your manners, to give them the necessary suppleness and flexibility; strength alone will not do.—*Chesterfield.*

Trifles make perfection, but perfection itself is no trifle.—*Michael Angelo.*

TRUST IN GOD.

BY IDA FAIRFIELD.

I trust in Thee,
Father of life! Thou great and glorious one,
The shadow of thy wing is over me,
And terror there is none.

Why should I fear?
My God who on the stormy billow rides,
Gives the glad sunshine and the calm, to cheer,
And the lone bubble guides.

No harm can come,
Thy hand o'erveileth all things for my good,
Thou hand which guides the sparrow to its home,
And gives the raven food.

When earth is drear,
When sickness lays her hand upon my brow,
Thy voice, O heavenly comforter, I hear,
Like music soft and low.

In the lone night,
When darkness spreads her wings from pole to pole,
What visions of unspeakable delight
Flow in upon my soul!

In lowly prayer,
When heart and soul bow 'neath thy searching glance,
Some angel-wings my spirit seem to bear
Upward in holy trance.

And then I know,
Thy chastening hand is stretched out in love,
The thorny hedge guards from the gulf below,
The sky is bright above.

For every tear,
Which sorrow wrings, the patient soul shall win
An added gem, in that bright crown to wear,
When freed from earth and sin.

Then Holy One!
Be still my stay—to Thee my cry is given,
Gird up my soul, till the bright rest is won,
The glorious rest of Heaven.

New Haven, June, 1854.

[For Moore's Rural New-Yorker.]

THE CONTRAST.

Everybody loves him. That is, everybody that knows him. He is an apprentice boy, about seventeen years of age, the son of a poor widow, and of course has not a large circle of acquaintances. But he is a modest, quiet boy, industrious, and faithful to his employer, who confides in him, knowing that his work will be as faithfully performed in his absence as in his presence. His evenings are spent at home; he is fond of books,—not light, trashy novels, which dissipate without informing or strengthening the mind,—but histories, biographies, travels, popular scientific works, religious memoirs and treatises. His Bible lies constantly on his table, and a portion of it is perused every day.

From his active daily labors, he finds in these rest, recreation and enjoyment. His Sabbaths are to him days of rest, but not of idleness. He has a little class in the Sabbath School, and he is interested and delighted in instructing them. His bright face is always seen in the accustomed place in the sanctuary, and he is always cheerful, furnishing a model for a picture of quiet, peaceful enjoyment. His widowed mother lays her hand upon his head, and smoothes his glossy hair, with maternal pride and comfort, for he promises to be the support and solace of her declining years.—There is a smile for him on every face, and every eye grows brighter when he enters the home his presence always makes happier,—all who know him love him.

I know another youth, a little older. He, too, is an apprentice, and his mother a widow. He hurries from his work in the evening, and mutters his impatient displeasure if his supper is a little delayed, because he is in haste to be out again among his companions. He is reckless and boisterous,—has no taste for reading, beyond an occasional glance at a newspaper, and his evenings are uniformly passed in the streets, and as often as he can get the means, in the theatre. His conversation is always low and vulgar, often obscene, and generally interspersed with profanity. He thinks it manly to be able to toss off a glass of liquor at a tavern-bar,—affects the bully, and often threatens to fight. He delights in rude and mischievous pranks, and finds pleasure in tormenting others,—helps to "make night hideous" with his boisterous laugh, his ribaldry and blasphemy, and at a late hour he seeks his bed, more wearied by his amusements, than by his labor. His work indeed, is irksome to him, and frequently neglected or slighted. His Sabbaths are gala-days, being spent upon wild excursions, or in roving the streets in search of amusement. His mother's heart is oppressed whenever she thinks of his wayward life, for he is no comfort to her now, nor is there any probability that he ever will be. His home, never happy, is more wretched when he is in it. For, boisterous as is his mirth in the street, at home he is grumbling and sullen. He is cauterizing all his social affections, leaving uncultivated his intellectual powers, so that few love, and none respect him.

It does not need a prophet's foresight to predict the future course of these two young men. In all probability the former will be a respected, useful member of society; the latter a scourge and a curse in the community, or at least he will find a level among the lowest and most debased classes. The one may look forward to the confidence and regard of men; the other to their scorn or indifference. The one has already begun to rise; the other, to sink. The influence of the one will be beneficial; of the other, baneful.

These characteristics and habits of youth must mould the future life, and prove a blessing or a curse, even if there is no eternity. The young man is a silly fool who trifles away his time, and forms habits that are necessarily unfitting him to fill any position of influence or respectability among men. But there is an eternity. What then?

Coeno, Illinois, June, 1854.

Miscellaneous.

[Written for Moore's Rural New-Yorker.]

NEBRASKA.

How oft along the pleasant vale
That skirts thy turbid river,
Have I with Indian followed trail
And bore for him the quiver.

Thy scenes are fresh to me, as when
We roamed thy green savannas;
When every herb with flower did bend,
And gentle gales did fan us.

Thy barren plains of burning sands
Seem dreary still as ever,
Where tree, nor shrub, nor flowret stands
To greet the gentle zephyr.

Thy turbid Platte—along its beach,
Pass sons of every nation;
And on its banks will ever bleach
The bones of emigration.

Thy red men driven by "pale faced" wile
Will from their homes disperse;
Thy Council fires will blaze awhile,
Then leave thy Bluffs forever!

The wicked hearts of *Christian* men
Have labored hard to blast thee;
By wily schemers, and fiendish plans,
To ruin thee, Nebraska!

Springwater, N. Y., 1854. D. B. W.

NIGHT AND DARKNESS.

There is many a period in man's career, when night and darkness seem to close around him like a pall, and shut out from his vision almost the star of hope. Almost, not entirely; for utter and irretrievable despair puts an end to all exertion, and results usually in unnatural or suicidal death. Such despair, such an utter blotting out of hope, falls only to the lot of the guilty wretch, against whom the door of mercy has been shut, in consequence of heinous crimes committed either against community or against himself; the murderer, the blasphemer, the man guilty of confirmed intemperance, or of kindred crimes. The habitual drunkard, in the last stages of that terrible disease known by the name of Delirium Tremens, is the best illustration of the horrors of a guilty conscience tormenting the wretch before his time; and such an example is the most potent lecture upon the evils of intemperance ever yet uttered by man.

But a virtuous and upright person need never despair, however cheerless the prospect may be before him. When difficulties press upon his path, and seem to present insurmountable obstacles against all further progress, some unexpected opening is sure to present itself at the last moment, offering an easy means of escape; and the difficulty, vanishing in perspective behind him as he proceeds, finally disappears below the horizon, leaving not even a cloud or shadow athwart the sky.

The difficulties which every man must encounter in the career of life, is aptly illustrated by the every-day experience of the traveler in a railroad car, through a mountainous country. He looks out of the car window, and observes in the blue distance an apparently inaccessible mountain barrier stretching across his path, toward which the fiery steed plunges in its mad career. A vague feeling of awe and fear comes over the spirit of the observer, which is only half allayed by the confidence he feels in the ability of the engineer to keep the powerful motor in perfect obedience to his will. Nearer and nearer the train approaches the barrier, and the interest and anxiety increase to learn the solution of the mystery. No check is observed in the speed of the train, and when at last it seems inevitable that the moving mass must be dashed against the rocks, the engine makes a graceful sweep across the line of vision, and, curving around the base of the incumbent cliffs, glides off through a narrow gorge, which, in its narrowness and the height of the enclosing walls, seems open only upwards to a strip of bright blue sky. Gradually the lateral barriers recede, until the gateway expands into a beautiful open country, with its waving fields of grain, and its cattle grazing on a thousand hills. The threatening impediments have vanished like a vision of the night, and it seems scarcely credible, while viewing the lovely prospect, that such formidable obstacles had an hour before crossed the traveler's path.

And such is life. Resistance must be overcome, obstacles surmounted or turned aside, and barriers removed; but stout hearts and willing hands can do it, and in the act they prove to be really less than they appeared in contemplation. Every man's experience who has not faltered under formidable difficulties, will coincide with the above, and bear witness to its truth.

The Morning Sun.—Very few persons, particularly in cities, are at all acquainted practically with the glories of the morning sun.—The poet *poetizes* about it—the prose writer *proses* about it—the singer *sings* of its beauty—the musician plays tunes at a midnight serenade, under a lady's window, comparing her eyes to stars, and her countenance to the rising sun; and she flutters a white handkerchief out of the casement as a token of acknowledgment. All of the above, get up themselves in the morning, after the sun has run his course half way up toward mid heaven.

[Written for the Rural New-Yorker.]

UNIVERSAL COMPLAINT.

Who can pride himself in his health and wealth, and vaunt that naught ails him? Are they free from every pain, whom doctors' bills do not overwhelm, nor nauseid prescriptions annoy? Though we scorn all nostrums and ridicule the heroic deeds of the sons of Æsculapius, and though we regularly consume our meals with the greatest appetite, we are nevertheless dragging along some complaint or other. Yes, it is an undeniable fact that both rich and poor, great and small, are all burdened with some uneasiness. Though they are not as yet candidates for the grave, still they are not for that reason any healthier or happier.

And are we not able to *guess* what ails us, one and all? For what is there that can give health and strength to him who continually utters cries of woe and lamentation? What will provide for all his wants? *It is Contentment only.* Who can glory in *its* possession? Go from the cradle to the grave, and you will rarely find that "continual feast"—contentment.

The city coxcomb is the embodiment of vanity, and he is amazingly vexed when his "honor," forsooth, is not regarded, or when his "consumptive" purse will not allow him to play a more magnificent fop than he really is. Say that the coxcomb is free from all complaint, and you utter a paradox that will never become orthodox.

Then there is a representative of a very numerous tribe, who at every accession to his stomach or pocket, is stung by a murmuring conscience which puts him a little "out of tune." He fears that his aims and motives, or that his tricks and falsehoods will one day come to brand day-light. This man is surely afflicted with a contagious disorder, and what can be worse?

Then there are some who are pained to learn that no praise has been awarded to their miserable *verses*, which, after a long scribbling, they may have sent for some country paper's "poet's corner." Then there is that passionate desire of "being up" to the fashion of upper tendom, which makes *her* so sickly, when she finds that *his* purse will not "split" with gold.

But why enumerate all the sickly, fidgety, sniveling, unhappy tribes of the human race? Every where "vales of misery" abound. You are not sure that whosoever appears to be "both healthy and wealthy and wise," may not "complain" of something or other. E. T.

EMBARKATION OF CAVALRY.

The embarkation of the horses was not accomplished without the occurrence of many exciting scenes, in which were evinced the strength and terror of the horses, and the address and resolution of the hussars, who, when foiled again and again in their attempts to fasten the sling upon their steeds, seemed never to doubt of success, and ultimately triumphed over all. Some were blinded by a kerchief tied over their eyes, others were quieted by kind words, others by caresses, even kisses, and in this way were seduced to submission; but a few of the horses were intractable by such gentle means, and a fore foot held in the hands of a hussar, or the twitch, a pole with a loop of leather at the end, fastened by twisting it on the upper lip or ear of the horse, reduced a hot-tempered horse to the desired state. But one or two desperate encounters happened. We saw a mare raise her fore feet over the shoulders of a hussar who was holding a halter at her mouth, and knock him to the earth under her. He fortunately was not much injured. Another hussar, while attending the last horse that was embarked, was bit in the arm by the animal as he was being taken into the air, and narrowly escaped making an involuntary ascent.

The worst struggle, however, remains to be told. It was with a powerful horse: we heard it belonged to the sergeant-major. His temper being known, the hussars, and riggers who assisted them, stood warily by as the sling was being applied. Three or four were at his head, smoothing the forehead, blinding his eyes, and holding him firmly by the halter; but the instant he felt the sling beneath him, he spurned it with his hind legs, and, rearing his fore ones, drove off all but those who held the halter, and them he dragged to some distance from the ship's side. He was drawn back, and a second attempt was made, but with a similar result. It was some time before he could be brought a third time under the yard of the ship, but when there one of his fore legs was doubled up and fastened by a rope. This operation did not tame him, but he pawed in the air with the leg which was free, clearing a way before him, and, the attempt being a failure, the bound leg was liberated. Numbers of men then came around him. The pain inflicted by the instrument seemed to doubly infuriate the animal; he stood upon his hind legs, plunged forward, or kicked and reared alternately, throwing from him all but the three men who held the two ends of the halter and the twitch.

His frantic motions compelled those who held the halter to let it go, but the third soldier stuck to his twitch with a tenacity which was the surprise and admiration of all who beheld the contest. At times he was borne off the ground by the horse, but he never let go, and the horse at length stood still, trembling, mastered probably by the torture of the twitch. He was led back to the centre of the sawdust, and for a moment or two seemed to submit to the desired operation; but as one of the riggers was passing behind him with the breech cord, the terrified animal once more flung out his hoofs, and in doing so kicked the rigger in the abdomen. The poor fellow staggered on one side and fell with a piteous exclamation. An officer ordered him to be removed to the doctor's office, and instantly he was taken from the spot in the arms of his mates. We understand the hurt he received, although agonizing for the time, is not likely to be fatal. It was a bare escape with life.

After this serious accident, a long rope was procured, and a noose made at one end. This was laid on the ground, and the horse brought to step on it. The line was jerked, and the noose was fastened on the horse's hind hoof.—The instant he felt the trammel, he kicked, if possible, more violently than before, and then darted to and fro with a velocity that made it impossible for any one to hold the leg rope.—The man with the twitch, however, never let go his hold on the horse's nose, and, after a terrible scene, that made the spectators fly to a distance for safety, the gallant soldier had the satisfaction to see the animal stand exhausted by his exertions. He was brought back to the ship's side once more, and the rope fastened to the hoof was brought between his fore legs over and around his neck, and secured. By this means the horse's power to resist was effectively diminished; the twitch was then applied to the ear instead of the nose.

The effect of this treatment was magical.—The horse did not stir while the sling was hixed and hooked to the tackle. The signal was given; the soldiers retired; the laborers ran off with the yard; back he swung, and oscillated once or twice, beating the air futilely; even that soon ceased, and in a few seconds he was deposited in the hold, where he was with some difficulty taken charge of by the dragoons below. The scene was extremely exciting, and at one moment even alarming; but the bravery and determination of the hussars made them superior to even the most fiery of the quadrupeds they had that day to deal with. Such men will be thunderbolts in the hottest brunt of battle.—*Exeter Gazette.*

THE WASHINGTON MONUMENT.

We learn that the workmen engaged in the erection of this noble structure, commenced laying the first course of stone of the season, only a few days ago, the unusual inclemency of the weather having prevented operations sooner. The height of the column is at present about one hundred and fifty-two feet. Owing to the smallness of the force employed—there being but thirty men, including masons and stone-cutters—and the want of funds, the work does not progress so rapidly as it ought. Last year but twenty-six feet was added to the height of the monument, and this year there will be added probably not more than thirty or thirty-five feet. At such a rate, ten years at least will be required to complete its erection.

The height of the obelisk, when finished, will be five hundred feet; and it will be fifty-five feet square at the base, and thirty-three feet square at the top. The wall is of the most substantial character, being fifteen feet in thickness at the base, and gradually decreasing to a thickness of four feet at the summit. At the present elevation, the thickness of the wall is about twelve feet three inches.

The monument will be lighted by gas from pipes attached to the winding iron staircase that will ascend to the top. It is not, as yet, known what will be the crowning piece, but it will probably be a huge mass of glass, bearing upon it some patriotic device.

The number of stones contributed by the different States, associations, &c., up to the present time, is about one hundred and ninety, of which there are seventy in the obelisk.—These are arranged in a conspicuous and systematic manner, and will be visible to the visitor, who, as he ascends the staircase, can examine them at his leisure. All of the States, we believe, have now contributed blocks.

The stones, mortar, &c., are raised to their place by means of an engine below, and derricks above, the latter having attached to them bells which serve as signals to apprise the engineer of the safe arrival from *terra firma* of some important body essential to the progress of the work.

As an instance of the facility with which different articles are hoisted, we should mention that the Massachusetts block, weighing four tons, was lifted to a height of one hundred and four feet, swung round, and set in its place in five minutes from the time it left the ground. —*Globe.*

A correspondent of an Eastern paper, says that the village of Niagara Falls, where he stopped, is just becoming a manufacturing place. Heretofore it has been given over to a harpy brood of hotel keepers and their rapacious satellites. The regular price for looking at a porter or waiter is two shillings, for speaking to him fifty cents. We gave a man a quarter to point out to us the log on which a poor fellow who was washed over the Falls a few months since clung for hours, and as there happened to be another log in the same range, he thought he ought to have an extra ninepence for that. Mammon is a popular deity, and his congregation, we imagine, must be disinherited descendants of the golden (or some other) calf.

A Turkish Will.—A testator left to his eldest son one-half of his horses, to his second son one-third of his horses, to his third son one-ninth of his horses—the testator had seventeen horses. The executor did not know what to do, as seventeen will neither divide by two, by three, nor by nine. A Dervish came up on horseback, and the executor consulted him.—The Dervish said, "Take my horse and add him to the others." There were then eighteen horses. The executor then gave to the eldest son one-half, 9; to the second son one-third, 6; to the third son one-ninth, 2; total 17. The Dervish then said, "You don't want my horse now; I will take him back again."

Mistrust the man who finds everything good, the man who finds everything evil, and still more, the man who is indifferent to everything.—*Lavater.*

Ladies' Department.

CONDUCTED BY A——E.

NEAR THE BANKS OF THAT LONE RIVER.

BY GEORGE P. MORRIS.

Near the banks of that lone river,
Where the water-lilies grow,
Breathed the fairest flower that ever
Bloomed and faded years ago.

How we met and loved and parted,
None on earth can ever know—
Nor how pure and gentle-hearted
Beamed the mourned one years ago.

Like the stream with lilies laden,
Will I fix future current flow,
Till in heaven I meet the maiden
Fondly cherished years ago.

Hearts that love like mine forget not;
They're the same in weal or woe;
And the star of memory set not
In the grave of years ago.

Trans-Atlantic Epistles,

TO COUSIN KATEY.

Communicated thro' Moore's Rural New-Yorker.

EPISTLE SEVENTH.

Rome, April 15th, 1854.

Dear Cousin Katey:—We are in Rome, the "seven-hilled," the "eternal city," which so long held the reins of universal empire, and which still proudly claims to be the capital of the Christian world. My last letter was dated at Brussels. From there we hastened our journey here, that we might be in time to witness the imposing ceremonies of "Holy Week." I must reserve an account of the objects of interest we saw upon our route, particularly of the glorious scenery of the Rhine, until another time; at present I can talk of nothing but Rome, this city of ruins and of palaces, which has impressed me more than anything I have yet seen. What surprises me most is the extent and abundance of the ancient monuments. My idea of Rome before coming here, was that it contained ruins, and gigantic ones too, but that these were comparatively rare objects, which must be sought for to be found. On the contrary, I find I can hardly take a step in the city or its environs without encountering some relic of Rome's former grandeur, so colossal in its proportions as entirely to dwarf the modern constructions by which it is surrounded. Sometimes it is almost impossible to ascertain what was the original destination of these edifices. The guide-books give a host of conflicting opinions, and the indolent Italians who people these famous localities, are content to pasture their flocks and cultivate their vines on the very soil which the Cæsars once trod, without giving a thought to the glory and greatness which environed their ancestors,—perhaps without even knowing they have ever existed.

Next to the ruins in interest, are the specimens of ancient sculpture, which are collected here in such rich profusion. The famous group of Laocoon, the Apollo di Belvidere, the dying Gladiator,—each is a study in itself. The anguish and terror so vividly depicted in the Laocoon, the breathing life and power of the Apollo, and the mingling of suffering and of fortitude in the attitude and countenance of the Gladiator, impress the beholder more deeply than words can describe. In modern sculpture, nothing can surpass some of the works of Canova. His Angel of Death, in the tomb of Clement 13th, at St. Peter's, is a personification of all that is lovely in form and feature, while the lions which repose at the base of the monument, are equally perfect in their kind. More than all this, Rome is the city which Michael Angelo and Raphael embellished with their finest works. At every step we meet with some of the sublime conceptions of the former, whose towering genius sought expression in painting, in sculpture, and in architecture, or with some more unpretending work of art, whose spiritual grace and beauty are due to the pencil of the latter.

Private palaces and villas abound, whose magnificent halls and saloons, filled with paintings and statuary, are opened to the public with the most princely generosity. Just fancy me, Katey, roaming hour after hour through these splendid apartments, where the windows, the doors, and often the walls themselves, are hung with the most costly tapestries, and, when weary, sinking upon a gilded couch, covered, perhaps, with glittering embroidery, and fixing my eyes on some fine old painting, very conveniently hung just opposite. Do you fear I shall lose my relish for simple pleasures and republican institutions, amid all this pomp and splendor? Not at all, dear Katey! I would exchange the proudest palace in Rome for a quiet cottage home in "my own, my native land." Italy is a delightful country to visit, but the last in which I should wish to live.—The Pope's tiara itself would not tempt me.

This reminds me of the ceremonies of "Holy Week," of which you doubtless wish to hear something. These performances begin upon Palm Sunday, with a service intended to represent Christ's entry into Jerusalem, just before his crucifixion. Unfortunately, however, the ceremony forms a most striking contrast with the event it professes to commemorate. The Pope, instead of making his appearance like our Savior, meek and lowly, mounted in the most humble manner, is borne in state on the shoulders of twelve men, with a canopy covering him; is flanked by Swiss guards, and preceded and followed by a long train of Cardinals and other dignitaries, whose robes, like that of the Pontiff himself, glitter with gold and precious stones. Even the palms which are borne by the procession, have undergone a metamorphosis. They are no longer simple branches of trees, but are fanciful fabrications, from a kind of straw like that of which palm-leaf hats are made.

On Wednesday, Thursday and Friday of this week, at four o'clock in the afternoon, services called the Penebræ, are held in the Sistine Chapel. It is at the close of these exercises that the famous Misereres are sung. This name is given to them because the psalm which is chanted at this time, (the 50th,) begins, in Latin, with the word *miserere*. The psalm is repeated every day, but the music is varied, being by a different composer on each occasion. The notes are exceedingly sweet and plaintive, and the effect is heightened by the obscurity which reigns throughout the Chapel during their execution.

On Thursday, about noon, the Pope washes the feet of thirteen persons selected to represent the apostles, and afterwards serves them at table. In these ceremonies the same contrast is to be observed between the original event and the commemorative rite, as on Palm Sunday. The apron which is tied on the Pope to represent the towel with which our Savior girded himself, is trimmed with the most costly lace, and the basin in which the feet are washed is of silver gilt. The table glitters with gold and silver, and each dish which the pontiff serves, is presented to him by a kneeling attendant. The stay of "His Holiness" at the table was short—after supplying his guests with soup, wine, fish, and then with wine again, he gave his blessing and retired. At his departure a restraint seemed to be removed, and the apostles continued their meal with excellent appetites. Two roguish looking boys, who *stood among* the attendants at one end of the table, exchanged glances and smiles, apparently much amused at the evident relish with which the various dishes were despatched. When the apostles had satisfied their hunger, an attendant stationed himself behind each of them with an immense covered basket, large enough to hold nearly half a bushel. To these persons the dishes, with which the table was still loaded were handed, and their contents transferred into the aforesaid baskets; sweet-meats, fruits and vegetables being mingled in one indiscriminate mass. When everything had been swept clean, and not till then, the apostles took their departure, each being accompanied or preceded by his basket of provisions.

Easter Sunday, which closes Holy Week, is the grand festival of rejoicing, designed to commemorate the resurrection of our Lord. The Pope himself celebrates high mass on this day in St. Peters, assisted by an imposing *cortege* of Cardinals and other dignitaries in church and state. At the close of this ceremony the immense throng of people with which the church is filled, pass out into the large square in front of the building; all the military in the city are drawn up there in brilliant array, and the sovereign pontiff, who makes his appearance in a balcony directly over the principal entrance to St. Peters, bestows his benediction on the gathered multitude. All the bells in the city then peal out together, the cannon from the castle of St. Angelo thunder forth their responsive congratulations, the troops march off to the strains of martial music, and all is gayety and rejoicing. In the evening St. Peters is illuminated, and so remains far into the night, its massive form defined in lines of flame upon the dusky azure of the sky. We were not sorry to have an opportunity of seeing this marvel of the world under a new aspect, and of imprinting its fiery outline on our memories in ineffaceable characters. A week's study is necessary to comprehend this building alone. Its accurate proportions so deceive the eye, that the mind refuses to receive the impression of its vastness, and it is only after repeated visits, after wandering for hours through its immense naves, and gazing on its magnificent dome from every possible point of view, that one sees this giant edifice in its true light.

On Monday evening there was a brilliant display of fireworks, and with this the exhibitions of Holy Week were brought to a close. *Exhibitions*, I say, and no other word, to my mind, expresses the idea so correctly. Everything in the services except the mere outward form, seems designedly removed, as far as possible, from the comprehension of the multitude. The prayers, psalms, the extracts from the Bible, everything, in fact, is read or sung in Latin; and I saw but very few, even among the devout Catholics, who made the least attempt to follow the different parts of the service. Such, dear Katey, are the religious privileges which the subjects of the Pope, who claims to be Christ's vicar, enjoy. I could not but recall our Saviour's message to John, when, in recounting the proofs of His Messiahship, he gave as the last and most convincing of all, "And the poor have the gospel preached unto them." Minnie.

MOORE'S RURAL NEW-YORKER

ROCHESTER, JULY 1, 1854.

To Agents and Others.

A new half volume of the RURAL commences next week—a favorable time to subscribe or form clubs for either six months or a year. Agents and other kind friends throughout the country are requested to give the matter such attention as may be consistent with their engagements. The RURAL will be furnished for six months, from July to January, at half the yearly rates, or as follows:—Three copies for $2,50; Six copies (and one free to agent) for $5; Ten copies (and one to agent) for $7,50; Twenty copies (and one to agent) for $12,50.

The Sixth Volume of THE WOOL GROWER AND STOCK REGISTER,—improved and enlarged to 32 pages monthly—also commences the 1st of July. We will furnish the two journals, *one year*, at the following low rates:—Three copies of W. G. & S. R. and one of RURAL for $3; Five copies W. G. and two of RURAL for $5; Nine copies W. G. and three of RURAL for $8; Twelve copies of W. G. and four of RURAL for $12. ☞Specimen numbers, &c., of both journals sent free to all applicants.

July to January.

THE second half of our present volume will commence on Saturday next. Those whose subscriptions expire this week, will bear in mind that a prompt renewal is necessary to secure the regular continuance of the RURAL, as we adhere strictly to the cash system in its publication. And in renewing their subscriptions, we trust our friends will not "forget to remember" that the names of as many of their acquaintances as may be conveniently obtained, will prove acceptable. Though we have been favored with an unexpectedly large increase of subscribers during the past six months, our books are not yet full, and we shall not object to additions to any reasonable extent.

—The RURAL has thousands of well-wishers, every one of whom could obtain at least one new subscriber, without trouble or loss of time,—and very many could, by giving the matter a little attention, form respectable clubs of subscribers. Those disposed to exercise a portion of influence in support of this or our monthly journal, are referred to above item for terms, &c., with the assurance that any substantial aid rendered will be duly noted and appreciated.

The Glorious Fourth.

JUST as this paper is going to press, we are reminded that the Anniversary of American Independence will occur before the publication of another number. We had intended to give in the RURAL preceding the Fourth, reading and illustrations appropriate to the occasion, but it is now too late for more than a brief paragraph. We trust the Day will be appropriately celebrated by Americans, and all lovers of Freedom and Free Institutions. In the language of JOHN ADAMS—"It ought to be commemorated as the DAY OF DELIVERANCE, by solemn acts of devotion to Almighty God. It ought to be solemnized with pomp, shows, games, sports, guns, bells, bonfires, and illuminations, *from one end of the Continent to the other*, from this time forward forever."

—While we subscribe to this sentiment, we would caution all against carelessness, or extravagant indulgence. The juniors should be especially careful in the use of fire-works—for, even in the hands of men, prudence is necessary to secure safety. We wish all the young people—and particularly the Boy-Farmers, whose labors are so arduous at this season—to have a glorious holiday, for American boys were not born to work on the Fourth of July.

THE FOREIGN NEWS.—The news from Europe by the late steamers is of great interest in many respects. So far as regards the markets for breadstuffs, our predictions have been fully realized; and the farmer who harnessed up his horses and took to market the last bushel of wheat he had left on hand to sell, did a wise thing, for the downward tendency has been even more rapid within a few days past than for some time previous.

The war movements indicate a crisis between the belligerents on the shores of the Black Sea, and ere this, a great and decisive battle may have been fought. Silistria was, at the last accounts, in a state of siege by 60,000 Russians, by whom several attempts had been made to take the place by storm. They were repulsed, however, by the Turkish garrison, with great slaughter, and the place was holding out with the expectation of relief from the allied army. Decisive measures will be taken now or never, as the summer is advancing, and nothing can be done in a winter campaign. The eyes of the civilized world are now turned towards the banks of the Danube, in expectation of great events transpiring there.

CANADIAN PARLIAMENT.—The ministry have been defeated in the Canadian Legislative Assembly, whereupon the Governor General, Lord ELGIN, dissolved the Parliament, and has issued writs for a new election. The legislature was dissatisfied that the Governor General did not, in his speech at the opening, announce his intention to submit a bill for the immediate settlement of the Seigorial question, and the secularization of the Clergy Reserves. The popular branch of provincial parliament shows a sturdy spirit of independence, and will not be over-ridden by the crown-appointed officials. Canada will yet become independent.

A Great Strike.

ON Tuesday, the 20th inst., at 12 o'clock at noon, all the engine drivers on the eastern and middle divisions of the New York & Erie Railroad, some 200 in number, struck, and left their engines wherever they happened to be. The consequence was, that all the trains were stopped, and the transit of passengers, as well as the mails and freight, came to a dead halt, greatly to the inconvenience of the public, as well as of the Company.

The cause of the trouble was the adoption of certain rules by the Company which were offensive to the engineers; the chief objection being to a rule that they would be held responsible for running off any switch at stations where the trains were required to stop. The Superintendent says the engineers are bound to see that the track is right ahead at the time of starting or stopping their trains; and that the rule of running the road most be, "safety first and speed afterwards." He gave three days to the engineers to return to their stations, after which new men would be employed in place of those who still held out. The striking engineers and their friends have made riotous demonstrations at several points, and at Susquehannah, on Thursday, forcibly took an engineer from his train. A police force is on active duty at Jersey City, and the sheriffs of the counties of Rockland and Orange, in this State and Susquehannah, Pa., are out with posses to protect the property of the Company.

The Veterans of 1812.

THE surviving officers and soldiers of the war of 1812, met in Convention at Syracuse on Tuesday of last week, and held an interesting two days session. Speeches were made, and addresses and resolutions passed. Delegates of Indians representing the Six Nations, were also present, and took part in the proceedings. They were invited to select one of their number to address the Convention, when Mr. HENRY JORDAN, an Indian of the Oneida tribe, made some remarks upon the neglect with which the whites and the government have treated their services.

Three cheers were then given for the Indians, and, by request, they were gathered together, and the War Whoop three times given and responded to. Three cheers were then given in return. The Indians performed the ceremony of adopting Gen. BENSON, and named him ON-WEN-JA-KWE-GON—"*Whole World.*"

Intolerance Repudiated.

THE *Shepherd of the Valley*, the organ of the Roman Catholics in St. Louis, has been discontinued for want of support. This intolerant organ was the one which gloried in stating that if Popery ever gained the ascendancy in the United States, as it undoubtedly would at some future day, religious toleration would be at an end; and also solemnly declared in substance, that popular education and the general diffusion of knowledge was a curse rather than a blessing.

The Buffalo *Sentinel*, a Roman Catholic paper of kindred sentiments, has also been discontinued. The publisher says the expenses of the paper for the past year have been $60 per week, and the receipts $13. The aid and comfort of the Archbishop of St. Louis, who headed the columns of the *Shepherd* with his own name and sanction, could not save it from perdition.

The Weather and the Crops.

THE recent rains and the present warm weather push vegetation along very rapidly. The summer grains are hastening toward maturity, and the fall crops are "spreading themselves like a green bay-tree." The hoe is active in the corn and potato fields, and the scythe will not be far behind in activity, if indeed it is not now sweeping through the tall grass of the meadows with destructive effect.

The scent of new-mown hay is grateful even to the nostrils of a citizen, and is much pleasanter than the snuff he usually inhales, compounded of McAdamized stone, street offals, hoof-parings, coal dust, and ferruginous particles from iron-shod feet and locomotive wheels.

"God made the country, and man made the town!"

DEATH OF N. DAVIDSON REDPATH, ESQ.:—It becomes our painful duty to chronicle the decease of this able and esteemed contributor to the pages of the RURAL. Though personally unacquainted with Mr. R., we have long regarded him as a gentleman of talent and worth.—Many readers will, with us, sincerely lament his sudden demise. The following notice was received by mail:

DIED, suddenly, at Fogo P. O., Allegan Co., Michigan, on the 30th ult., N. DAVIDSON REDPATH, aged 48 years.

THE readers of the RURAL will recognize in the death of Mr. REDPATH, one of its able contributors. A man of an erudite, comprehensive and investigating mind, he took a warm interest in whatever pertained to the advancement of Agricultural science. His urbanity of manners, unassuming deportment, benevolent disposition, and christain character, secured to him many sincere friends, and his family will sustain, by his death, the loss of a kind husband and an affectionate father. ALEX. GILLES, M. D.

THE TEMPEST INSURANCE COMPANY has acquired an enviable reputation as a safe and well-managed association. Its principal officers and stock-holders are men of character, possessing the means, and, we doubt not, the disposition, to make good the assurances and engagements of the Company. Unless we are misinformed, the Tempest Company is worthy the attention of farmers and others who wish, as all should, to secure insurance upon their homes. See advertisement in this paper.

"Who Killed Cock-Robin?"

LAST week we briefly noticed a ridiculous charge by Dr. D. LEE, [editor of the *Gen. Farmer*,—also senior editor of the *Rochester American*, (a political paper) and the *Southern (Ga.) Cultivator*,] accusing us of "resorting to falsehood to injure the *Farmer*." Since then we have been credibly informed that the Dr. *supposed* we had furnished copies of his *southern* paper to certain journals of this city, from which they had extracted his fast-becoming-celebrated essay on "Hireling and Slave Labor"—hence his complimentary notice. Our amiable friend was never more mistaken. The only person to whom we have furnished the *Southern Cultivator* (with which we exchange) containing the article in question, is *Dr. Daniel Lee*, who applied for it during his controversy with the city dailies! Neither have we written a line on the subject for any other paper than the RURAL,—and not for that until the suspicious Dr. had attacked us on *hypothesis*, though his prelence was an article published by us a month or two previous to his charge.

But a correspondent of the *Daily Union* informs the Dr., and the "rest of mankind" interested, how his labored production, intended exclusively for a Southern market, first appeared in a Northern paper. He says:—"A gentleman in South Carolina, when writing on business matters, called my attention to this article by Dr. LEE, and also sent me by mail a copy of the *Southern Cultivator* containing the article.—Happening to meet Mr. DOUGLASS, [editor of the Rochester paper which first published Dr. L.'s article on 'Hireling and Slave Labor,'] I handed him the paper, stating that he would find in it an article by Dr. LEE, requiring his attention. It will be seen, therefore, that this matter was brought to light, and this 'attack' commenced, by a South Carolina Slaveholder! I give below some extracts from the letter of this gentleman:

"* * * There is a strong prejudice here against Northern men and Northern journals. Slavery is the god too many worship—and Northern men are to a great measure responsible for this feeling. Witness the attack of Dr. Lee on the New York Times, and other Northern Journals. By the by, I will send you a copy of the *Southern Cultivator*, published at Augusta, Georgia, and edited by Dr. Lee, of your city. See what a Northern man finds it to his *interest* to say in a Southern paper. While Northern men are found who will thus disgrace and sell themselves, is it strange that men born and educated at the South, should think Slavery a necessary evil, or even a great good?"

"* * * Is it true, that an able bodied man, willing to work, such as Dr. Lee describes, cannot in the city of Rochester, earn a peck of corn meal and a pound or two of pork, [the allowance of a slave here,] by a week's labor. If this is true, God help Rochester."

"* * * I think the people here, needlessly and foolishly sensitive on the subject of slavery, and the people of the North, or at least many of them, imprudent and rash in their opposition to it. I am a slaveholder, and my friends and neighbors are all slaveholders; yet I believe Slavery to be a great wrong, and I cannot but despise every Northern man who professes to believe it good."

CHEAP TRAVELING.—A strife for the through business, from Cincinnati to the lakes, has sprung up between the two railroad routes, one running by the way of Cleveland, and the other by way of Sandusky. Passengers are now carried from Buffalo, boarded on the lake steamers to Cleveland or Sandusky, and then taken through to Cincinnati by rail, all for four dollars. At such rates of fare, it is cheaper to travel than to stay at home, to say nothing of a chance for the cholera, yellow fever, or some other summer epidemic thrown in; but the contest is ruinous to the interests of the companies, and ultimately of the traveling public; for when competition reduces prices below a living profit, ruin must follow if persisted in. A healthy and active rivalry is beneficial to all parties, but beyond that point, it is no permanent advantage to any one.

ANNEXATION OF THE SANDWICH ISLANDS.—A despatch has been received at Washington from the American Commissioner at the Sandwich Islands (Mr. Gregg,) stating that the authorities of these islands propose to throw themselves into the hands of the American Government for protection against the British, French, and other foreign settlers. The Commissioner, the N. Y. *Courier and Enquirer* states, has been empowered to accept the Islands for the United States, and assure the native government of American protection.

It will be recollected that overtures of a similar nature were made to Mr. FILLMORE'S administration by the authorities of those islands, and rejected, much to the grief and scandal of filibusters and annexationists.

A GREAT LAKE.—Nearly due north of Quebec, one hundred and eight miles as the bird flies, and probably one hundred and thirty by a constructed road, lies a magnificent lake, covering an area of 600 square miles, and abounding with a variety of fish. It is fed by numerous rivers, some of them navigable for a considerable distance for a schooner or batteaux; it is the lake St. John, and from it flows the "Great Discharge," or main stream of the Saguenay river, as far down as Chicoutimi, a few miles beyond which the river is navigable for ships of the heaviest tonnage. On either bank of this river may be seen a flourishing settlement; the soil is of a rich and loamy nature, producing wheat, corn, fruit, &c., equal in quality and quantity to any raised in Upper Canada; and although 1½ degrees further north than Quebec, yet from the peculiarity of its geographical position, its climate is milder in winter than that of Montreal. For many miles on both banks of the river, as well as along both shores of the lake, are thousands of acres of the finest land, covered with a noble forest.—*Quebec Chronicle.*

News Paragraphs.

☞The Washington Star says, we understand that all the Indian tribes in Kansas and Nebraska have concluded treaties with the Commissioners of Indian Affairs, for the relinquishment of the lands at present occupied by them, within the scope of country proposed to be included under the two new governments. These treaties are one and all before the Senate, and will doubtless be promptly ratified, that body being quite anxious to expedite the formal organization of the new territorial governments.

☞The President of the U. States, accompanied by Mrs. Pierce, and her relative, Mrs. Smith, of New Hampshire, Gen. Cass, the Secretary of the Navy, and his private Secretary, Mr. Sidney Webster, embarked on the United States steamer Engineer, at the Washington Navy Yard, a few days since, for Old Point Comfort, where the party propose to remain until Tuesday or Wednesday next.

☞The Worcester Spy says, among the presents sent out by the Government to the Emperor of Japan, were some bottles of *American whiskey*. It was doubtless thought by the administration, that if His Royal Highness could only get a taste of the real "Old Monongahela," that he would forever after have a desire to trade with a people who could manufacture such a beverage.

☞The British Chancellor of the Exchequer has proposed to put an additional tax of 3s. a barrel on beer, and the retailers propose to increase the price twenty-five per cent. This addition to the expenses of his beer-drinking troubles John Bull a good deal, and will doubtless tend to render the Eastern war unpopular among many of the citizens of Great Britain.

☞Mr. Frederick Kemble, from the neighborhood of Rumney, Harrison county, Ohio, arrived in Steubenville last Wednesday, by railway, with his wife and nineteen children, twenty-one in all. It is said that he owns enough land in that State to give each one of his family one hundred and sixty acres and retain a "slice" for himself.

☞The Newark Advertiser says that a few miles from Trenton lives a woman of masculine frame and disposition, who is a very skillful mechanic. She has constructed a handsome carriage, makes and plays violins, and has manufactured a gun, besides many other articles. She is entirely self-taught, and is only 25 years old.

☞Antoine le Duc, a Frenchman, ran ten miles in 58 minutes, at Eagle Harbor, Michigan, beating two Indians and an Irishman, for a wager of $100. The Irishman gave out on the fourth mile, one Indian on the eighth, and the other Indian was just a mile behind the victor, who left the ground shouting "Vive la France!"

☞According to the Boston Post the Sandwich Islands had better reciprocate favors received, and send missionaries to the United States. On the Island of Molakai, with a native population of 3,565, only two persons, one native and one foreigner, are reported as having been intoxicated during the year 1853.

☞U. S. Commissioner Carpenter publishes a long communication in the Philadelphia Gazette, denying the constitutionality of that portion of the Fugitive Slave Law making it the duty of Commissioners to issue warrants and hear cases. He says he has refused, and will continue to refuse, to issue warrants.

☞Senator Douglas has been presented by the officers at Fort Leavenworth, (the seat of Government of Kansas,) with a walking-cane. It is hickory, studded with large nuts, and was cut in that Territory. The ferule is steel, and a head of deer's horn, with a gold plate, inscribed "Kansas and Nebraska."

☞The Richmond Enquirer, in expostulating with Southerners against sending their youths to Northern institutions, says:—"If Southern gentlemen would not be instrumental in the political prostitution of their sons, they should not send them to Harrard for law, nor to Yale for science."

☞A little child named Hinds died in Boston on the 14th inst. from the effects of a sunstroke. Parents who send their children out in care of domestics, cannot be too careful in admonishing them to keep in the shade. When the walks are not shaded, an umbrella should be carried.

☞The Attorney General of the United States has given an opinion, in which he holds that the United States must pay the expenses incurred by the U. S. Marshal at Chicago in raising a posse in his district to aid him in the execution of the warrant for the arrest of a fugitive slave.

☞The Commissioner of Patents has renewed the Morse Telegraph Patent of June, 1840, for the term of seven years—Prof. Morse having disclaimed so much of his eight specifications as brings it within the decision of the Supreme Court in the recent case of Morse vs. O'Reilly.

☞The Cincinnati Enquirer says:—"The Georgetown (Ky.) Herald comes to us dressed in mourning, and upon looking for the cause of the funeral appearance, we find that the editor has been committed to jail by some municipal tribunal for *refusing to testify where he had got his liquor.*

☞On the 14th ult., Mr. Geo. W. Bowman, on his farm in Bullit county, Ky., killed a rattlesnake six feet four inches long, and eighteen inches round the body, with twenty-one rattles. It is believed that this was the largest and oldest rattlesnake ever seen in the Western country.

☞Capt. Barclay, the first man who is recorded to have walked 1,000 miles in 1,000 hours, died lately in Scotland, at the age of 76. He was an enthusiastic farmer, and traveled through the United States a few years ago, making agricultural observations.

☞A private soldier was lately shot at Fort Henry, Kingston, C. W., for desertion. In our army, flogging is the extreme penalty of the crime of desertion, except during actual war, and even then it is often superseded by confinement.

☞A U. S. Commissioner named Wilcox, of Columbus, Ohio, was called upon a few days since by a slave-hunter from Kentucky, for a process for the arrest of a fugitive slave. He declined to grant it, and resigned his office.

☞The Overseers of the poor at Tarrytown, posted notices at the hotels, stating that certain persons are known to be habitual drunkards, and forbidding liquor venders from selling them any intoxicating drinks whatever.

☞A New York news-boy, named Thomas McQuade, has just recovered $3000 from the New York & Erie Railroad Company, for damages received by him from the car in which he was seated running off the track.

News Brevities.

—There were nine deaths from Cholera in Brooklyn last week.

—Fifteen hundred dogs have been slain in the Cincinnati war.

—Opal, topaz and garnet stones have been found in Burke county, S. C.

—The wheat harvest commenced in Virginia during the present week.

—The people of Jackson, Miss., had ripe pears and apples on the 1st ult.

—Gen. Houston is to deliver an oration at Norwalk, Conn., on the Fourth of July.

—Immense flocks of pigeons are nesting in Fulton, Hamilton and Herkimer counties.

—A cargo of new wheat passed through Norfolk on Monday week for Baltimore.

—The Chinese emigration to California, this year, has been quite large, reaching above 4,000.

—A State Anti-Nebraska Convention will be held at Madison, Wis., on the 13th of July.

—Ten barges are in the regular hay trade from Albany, exporting $600,000 worth a year.

—The Troy Times says Marshal Mott has arrested thirty-five counterfeiters since he took office.

—There were ten fatal cases of Cholera in Boston last week, and on Sunday there was one more.

—The Batavia Advocate recommends Hon. Gen. W. Patterson, as the Whig candidate for Governor.

—Extensive coal fields are said to have been recently discovered in the county of Anson, N. C.

—The fare on the Richmond and Petersburgh (Va.) Railroad has been raised to six cents per mile.

—A new palace has been uncovered in the ruins of Nineveh, whose beauty excels any yet found in Assyria.

—One hundred and nine dogs were killed in Cleveland in four days, under the direction of the City Marshal.

—The whole debt of Philadelphia city is $18,000,000, of which $9,000,000 are in railroad stocks drawing interest.

—Sixteen hundred gallons of liquor were seized at Providence on Wednesday week—the first under the new law.

—A preliminary meeting has been held at Chillicothe to make arrangements for a company to emigrate to Nebraska.

—The boring for the Artesian well at Charleston, S. C., has reached 1150 feet, and so far with very doubtful success.

—Cincinnati contains 100,000 inhabitants, and yet there are raccoons and rabbits still within the limits of the corporation.

—Preparations are progressing for the rebuilding of the Suspension Bridge, at Wheeling, recently destroyed by a hurricane.

—The people of Kalamazoo, Mich., lately celebrated the completion of the first quarter of a century since the town was settled.

—A white man and two negroes were hung at Versailles, Ky., on Saturday, for murder, in the presence of 10,000 people.

—It is thought that the yield of peaches in New Jersey will be far less than last year; consequently, the prices will be much higher.

—Over 14,000 emigrants have arrived at Quebec within the last five months, of which a greater number were from England than Ireland.

—The Emperor Napoleon has established a system in Paris, by which the poor receive medical attendance at their own houses, free of expense.

—The Anniversary of the Battle of Bunker Hill, was celebrated in Charlestown, Mass., by the firing of cannon, ringing of bells, and a military parade.

—There were forty-five cases of cholera in New York last week—a decrease of twelve from the week previous. In Philadelphia six are reported.

—The grape culture at the West, particularly in Illinois and Ohio, is rapidly extending, and the first producers will probably realize large fortunes.

—The Great Tubular Iron Bridge over the St. Lawrence at Montreal, has been commenced. Fifteen hundred workmen are to be employed on it this summer.

—Prof. Stowe, the husband of Mrs. Uncle Tom's Cabin Stowe, has publicly announced that he will not shave his face until the fugitive slave law is repealed.

—The Brockport Collegiate Institute, recently destroyed by fire, is to be re-built, upon a large scale. A portion of the necessary funds have already been subscribed.

—John Van Buren expects to sail for Europe on the 1st of July, to be absent from three to four months. He intends to visit Scotland, St. Petersburg and Constantinople.

—It is stated that an important change has been made in the Constitution of Buenos Ayres, under which all persons born in the country are citizens, whatever may be their parentage.

—About 50,000 cigars, and some other articles, were seized at Portland by the Custom House officer on Saturday night. They were brought in a vessel just arrived from Cuba.

—Some $40,000, in ten dollar red back notes of the bank of Tennessee, were recently stolen from a box, in charge of the express, on a steamer between Cincinnati and Nashville.

—Metallic cornices are more generally in vogue this spring than heretofore. They possess all the qualities of stone, without the expense, and avoid the dangers from fire incurred by wooden ones.

—The Supreme Court of Rhode Island has given a unanimous opinion that the act of the last Legislature, expunging the record of its conviction of Thomas W. Dorr for treason, is unconstitutional.

—Queen Victoria has established a school for her out-of-door servants at Windsor, and for some time nearly every day occupies herself in teaching from the Bible, seating herself on a form for this purpose.

—We have learned, says the Trenton (N. J.) Gazette, the curious and rather alarming fact, that within two or three years past, the sale of opium in this city has increased something like one thousand per cent.

—The Artesian well at Frederick, Md., has been completed. The shaft has been carried down 585 feet, and now, the Examiner says, the water runs out at the rate of one hundred and fifty gallons a minute.

Literary Notices.

TWENTY YEARS IN THE PHILIPPINES. Translated from the French of PAUL DE LA GIRONIERE. New York: HARPERS.—1854.

AN interesting and romantic narrative by an adventurous French Physician, who "saw the Elephant" in many positions during a sojourn of twenty years among the barbarous natives of the Phillippine islands—inhabited by Indians, Chinese, Spaniards, Creoles, &c. The author gives in a simple, unaffected style, many interesting incidents, and much information concerning a region and people about which little is known. The volume is well and profusely illustrated. For sale by DARROW & BR.

JULIENNE: The Daughter of the Hamlet. By HENRI DE NORMAND. Rochester: WANZER, BEARDSLEY & Co.—1854.

SUCH is the title of an excellent story reproduced from a French romance. A friend who has perused the volume, assures us that it will bear warm commendation. The character of the heroine is pure, simple and religious—such as is too rarely delineated. The work presents a fine external appearance, and is quite creditable to its enterprising publishers.

ARMENIA:—A Year at Erzroom, and on the Frontiers of Russia, Turkey and Persia. By ROBERT CURZON. New York: HARPERS.

THIS is a volume of rare interest, descriptive of what the intelligent author saw and learned in a country which he aptly terms "the cradle of the human family." It is in elegant style, with a map and several illustrations. DARROW & BR. have the work.

CALAVAR; or the Knight of the Conquest. A Romance of Mexico. By ROBERT M. BIRD. New York: REDFIELD. 1854.

AN apparently readable volume, and certainly presented in fine style. A reliable contemporary remarks of this work that "there has never been a novel written, relating to the truly romantic period of American history—the age of the Spanish conquests—so admirable as this from the pen of the late lamented Dr. BIRD." For sale by DEWEY.

THE QUIET HEART. From Blackwood's Magazine.—HARPERS.

A VERY pleasant Scotch story, issued in cheap pamphlet form, as one of a series of select novels. DARROW & BR.

THE PEOPLE'S JOURNAL.—The second volume of this beautiful monthly, devoted to Agriculture and the Arts, commenced in June. Like its predecessors, the last number is profusely illustrated, and generally well filled in other respects. It has proved a better work than we anticipated, and we again commend it as worthy of support. Published by ALFRED E. BEACH, New York; 50 cents a volume (six months) or $1 a year.

Congressional.

Congressional.

THE principal matters of interest transpiring in the Senate during the past week are as follows:—

A report was submitted from the Committee on Patents, with a bill amending the Patent Laws of the United States.

The bill to promote the efficiency of the navy was passed, after the appointment of midshipmen by members of Congress had been stricken out.

Mr. Seward, from the Committee on Commerce, made a report, stating that the Committee had not been able to agree upon the proposition for aid by Congress for the construction of a ship canal around the Falls of Niagara. The Committee asked that they be discharged from the further consideration of the subject. Agreed to.

Mr. Hamlin reported a bill to establish a steamboat inspection district on the Pacific.

Mr. Rockwell, of Mass., presented a memorial signed by 1900 citizens of Massachusetts, including many of the first business men of Boston, in favor of the repeal of the Fugitive Slave Law.

Mr. Clayton submitted a remonstrance from a number of citizens of Delaware, against the proposed reciprocity in the exchange of breadstuffs between the United States and British American Provinces.

The following appointments were sent to the Senate yesterday: Gen. W. O. Butler, of Kentucky, Governor of Nebraska; A. H. Reeder, of Pa., Governor of Kansas; Mr. Woodson, of Va., Secretary of Kansas; Mr. Cummings, of Iowa, Marshall for Kansas; Mr. Ferguson, of Michigan, Chief Justice of Nebraska; and Messrs. Bradley, of Ind., Hardin, of Ga., and Elmore, of Ala., as Associate Judges.

Several Indian treaties were ratified.

HOUSE.—The House has agreed to meet hereafter on the first Monday of November, instead of December.

The Speaker presented a message from the President, stating that he had received information from Mexico that the Treaty, as amended, had been agreed to by Santa Anna. The President asked that an appropriation of $7,000,000 might be paid on the exchange of ratifications, which is fixed for the 30th inst. Also, an appropriation of $3,000,000, to be paid when the boundaries shall be settled.

The Clerk submitted an estimate of the expenses of the new books ordered, the expense being $17,500.

Resolutions were adopted granting the usual *per diem* and mileage to the family of Hon J. F. Snodgrass, of Va., deceased, and to Hon. Zeno Scudder, resigned.

Mr. Pratt, of Conn., submitted a series of resolutions passed by the Legislature of that State in favor of a reduction in the rates of ocean postage.

A number of private bills, reported from committee of the whole, were taken up and passed.

REV. PETER KROEMER, a Roman Catholic priest in Trinity Church, Cincinnati, has been held to bail in the sum of $2,000, to answer the charge of having committed an indecent assault upon Katherine Myers, a young girl 14 years of age, while at the confessional, on Monday week.

Foreign Intelligence.

Arrival of the Canada.

THE steamship Canada arrived at Halifax June 21st. Her news is of an interesting character, but has been superseded by despatches received by the Atlantic four days later. Preparations were making to push the war vigorously on all sides, and important movements are going on in the vicinity of Silistria. This important Turkish fortress, on the south side of the Danube, is closely invested by a Russian force numbering 80,000 men, and several assaults have been made upon it without success. The besieging forces, commanded by the Grand Duke Constantine in person, are struggling to capture the fortress before relief arrives from the allied forces encamped at Varna. There had been considerable fighting elsewhere. The Governor of Widdin writes that on 31st of May, a severe affair occurred at Slatina, when the Turks defeated 2,000 Russians, killed 500, and captured their artillery. Other encounters, more or less sanguinary, are reported.

Arrival of the Atlantic.

THE U. S. mail steamship Atlantic, with four days' later news from Europe, arrived at New York June 25.

It is reported that on the 8th the Turks in Silistria made a sally and destroyed the approaches of the besiegers, and filled up the mines before Silistria. The confidence of the Russians was visibly declining. They are said to have suffered serious loss on the springing of a Turkish counter mine.

Russian reports say that Massa Pasha, commander of Silistria, has been killed by a cannon shot. The Turks were to make a movement to relieve Silistria about the 18th. The Russians are fortifying Jassa.

The Chronicle correspondent telegraphs a report from the Baltic, that some English vessels off Brabstadt, in Finland, demanded the gunboats building there. They were refused entrance into the harbor. They then took or destroyed the gun-boats, and a large number of merchant ships, and fired the wharf. Ten thousand barrels of tar, and property to the amount of 300,000 silver rubles, were destroyed.

The Journal's Austrian correspondent at Vienna, states that the meeting of the Austrian and Prussian monarchs, furnishes another proof that the interests of Germany and Europe will be cared for in the war now waged by Russia against Turkey.

THE EAST.—The whole of the English light division is now at Varna. The third French division was daily expected to arrive at Constantinople. A great part of the combined fleets has left Sebastopol to transport troops from Constantinople to Varna. The dragoon corps has been ordered to advance by forced marches to Moldavia. The Transylvanian frontier is described as swarming with Cossacks. The combined squadrons have captured the redoubts Kale and Kali, with their arms and ammunition. The London Gazette officially announces the blockade of the Danube by the combined squadron.

CIRCASSIA.—A letter from Trebizond says Selim Pasha has sent 10,000 regular troops and 9,000 Baski Bassouks to Ozburgeli.

All the Russian troops who have evacuated the fortresses on the coast from Anapa to Kedoubt Kale have marched on Tiflis. Schamyl is within 18 hours' march of that place, at the head of 35,0000 men.

GREECE.—According to advices from Athens, the 30th, King Otho has amnestied the officers of the Greek army who had taken part in the insurrection in Epirus.

ARCHANGEL, May 27.—The ice in the river broke up on the 12th, and since then two ships have arrived from sea.

It is reported that Sweden has openly declared against Russia, and that she has recalled her minister from St. Petersburg; that the rupture between Prussia and Russia is complete; that Russia meditates an attack upon Austria; that the Turks have retired again from Lesser Wallachia, to concentrate at Kalafat.

LIVERPOOL MARKETS.—The weather being more favorable for the harvest, prices incline downward.

Brown & Shipley's Circular quotes the market on Tuesday as dull. Flour was nominally 38s-@38s6d for western, and 39s6d@40s for Ohio. Wheat and Indian corn sold at rather easier prices.

California News.

Arrival of the United States.

THE steamship United States arrived at New Orleans June 21, bringing intelligence from San Francisco to the 1st inst., 15 days later. The through trip from San Francisco has been one of the shortest on record.

The Isthmus Railroad had been so far completed that the trip across was made in 6 hours. Good health prevailed along the entire route.

Further accounts from Grenada throw considerable doubt upon the previous reports of a successful revolution.

The jury in the case of M. Dillon, the French Consul at San Francisco, charged with violating the neutrality laws of the United States, had failed to agree, and were discharged.

In the markets, since the departure of the steamer of the 15th May, there had been but a moderate business transacted.

The crops were coming in finely.

Further difficulties with the Indians are reported in different sections of the State.

Mr. McHaunchu, President of the Legislative Council of Washington Territory, was recently drowned in Puget's Sound.

Arrival of the North Star.

THE North Star, from Aspinwall, arrived at New York June 23. Her news has been anticipated via. New Orleans. She has 250 passengers, and $100,000 in dust on freight.

Marriages.

In Livonia, on the 21st ult., by the Rev. B. G. Ildley, GEO. C. BEECHER and Miss HELLEN M., daughter of Geo. B. Gibbs, Esq.

In Victor, June 18th, at the residence of Peter S. Bonesteel, Esq., by Silas Richardson, Esq., Mr. TUNIS BRIZEE, of Pittsford, Monroe Co., to Miss LUCINDA WOODARD, of the former place.

Deaths.

In this city on Monday, June 19, JNO. LORD, aged 68 years.

Commercial.

BUSINESS AND FINANCE.

THE imports and exports of the precious metals about balanced each other during the past week. The two Isthmus steamers bringing in about a million, and the Cunard and Collins steamers taking out $873,000.

The first million of the State loan for enlarging and finishing the Canals has been taken at a premium of from seventeen to twenty per cent. It was bidden off by bankers and brokers who have U. S. stocks deposited in the bank department, as a basis for banking purposes, and is designed to take the place of the latter. As the United States Treasurer offers 21 per cent. premium for the redemption of the public debt, this change of securities gives the operators a handsome profit.

There has prospect of an early disbursement of $7,000,000 of the coin accumulated in the Treasury, as the President has communicated to Congress the acceptance of the treaty by SANTA ANNA. The message asks for an appropriation of the above sum to be paid down, and the other three millions is to rest until the new line is run between the two countries.

Railroad stocks are unusually depressed, N. Y. Central has been down to 94, and Erie to 91. The strike on the latter road, probably depresses the stock.

P. S.—Since the above was in type, the telegraph announces the arrival of the steamer Prometheus, bringing between 500 and 600 passengers, and a million and a half in treasure from California.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, June 29, 1854.

BREADSTUFFS show a further depression both at home and abroad. Foreign advices indicate the prospect of good crops in Europe, and a consequent absence of speculation and activity in the market; and at home buyers are unwilling to assume the risk of large purchases under present contingencies. Prime Genesee wheat will not bring, in our market, over two dollars per bushel, and flour is selling to the trade at ten dollars, to ten twenty-five. Corn scarcely sells, and is forty-eight to fifty.

Hay is better, and sales quick at $16 for first quality.—Other products of the farm about as last week.

Wool dull, and little offered at previous quotations.

Rochester Wholesale Prices.

NEW YORK MARKET—June 26.

FLOUR—Market for common grades of flour rules in favor of the buyer. Holders can only realize by submitting to easier prices. There is some demand for export both for England and France, but at very low figures. The better grades without important change, yet it is difficult to sell anything but small parcels at former prices. Sales 4,000 bbls $8,75@8,87½ for inferior State, $7@7,50 for common to straight State, $7,12½@7,75 for mixed to fancy western. In addition to the above there were 3,000 bbls State sold, deliverable the first fifteen days in July, at $7.

GRAIN—Wheat market dull and lower. Sales 3,200 bus. fair red Upper Lake $1,60. Fair demand for rye. Corn—moderate business doing, and prices without important change. Sales 27,000 bushels 75@81c for unsound to good mixed western; 80@85c for strictly prime do.; 86c for round yellow, closing heavy. Oats less plenty and better. Sales at 55@56c for State and western.

PROVISIONS—Pork is a shade easier with a moderate business doing, $13 for mess; $11,50 for prime. Lard—no change; bbls. 9½@9¾c.

ALBANY MARKET—June 24.

FLOUR—The transactions sum. up 600 bbls at $8@8,50 for common to good State and western; $8@9,60 for good Michigan and Ohio; $9,62@10,25 for extra western, and $10@10,75 for extra Genesee. The market at the close was dull and heavy. Corn Meal is in fair request and firm at $1,56 ₩ 100 lbs.

GRAIN—Our wheat market is heavy. Sales of some 6,300 bushels good to prime white Michigan on private terms. Corn less firm but more active, with fair supply. Sales of 13,000 bushels at 77@78c for western mixed, the latter figure for lots at the depot—78@80c for inferior to prime round yellow. In Barley and Rye nothing doing. Oats quiet; no sales.

BUFFALO MARKET—June 26.

Holders of best brands of flour, in the advance of any demand, offer no concession from former rates, but inferior brands are offered at 25c decline. There are sales of 250 bbls fair to choice Ohio at $7,87½@8,12½.

GRAIN—Wheat dull and inactive, and without any movement to fix quotations. Corn in fair demand, at a decline of 2@3c. Sales about 50,000 bushels at 64c afloat, and here to boats. Market at noon dull. Oats dull and inactive—no sales.

NEW YORK CATTLE MARKET—June 19.

AT Washington Grove Yard—Offered during the week 2,010 Beef Cattle. Supplies did not come in so freely yesterday as on the previous Monday; but purchasers showing no disposition to operate to any extent beyond immediate wants, the market was dull, and prices at about the figures of last week, which we accordingly repeat. About 200 head left over. Veal and Mutton without much variation. We quote Beef Cattle $7@10, but $11 is a fair average; Cows and Calves are advancing; sales at $20@35; Veal Calves 4@5c per lb; Sheep $3@7; Swine (corn fed) $4,75@5 per cwt.

At Browning's—Prices at this market for Beeves have declined. Sales at $9,00@11,00 ₩ 100 lbs. for Beeves; Cows and Calves sold at from $30 to $45@55. Veal sold at from 4½ to 5½c per lb., live weight. Sheep range at from $2,50 to $7,50; Lambs at $2 to $4@6.

At Chamberlain's—Prices of Beef ranged at from $8,50 to $10,50 per 100 lbs. Cows and Calves of good quality in demand—sales at from $30 to 60. Veal Calves 4@5c per lb. Sheep and Lambs in good demand; wooled sold at 4@5c per lb.; sheared 3@5c. Lambs 2½@3c.

At O'Brien's—Sales of Beeves at $8@10,00. Cows and Calves at from $35 to $45.

CAMBRIDGE CATTLE MARKET,—June 21.

AT market 218 Beeves, no Stores. Market Beef—Extra, $9,00 per cwt.; 1st quality, $8,50; 2d do, $7,75@8,00; 3d, do, $7,75; ordinary, $7,50. Hides, ₩ cwt. $6,00@6,50.—Tallow $8,00@8,50. Pelts, 50@1,00. Calf Skins, 16c ₩ lb. Veal Calves from $2,50 to $5.

STORES—Working Oxen—$120 to $170@184.

COWS AND CALVES—$27 to $54@70. Two years old—$24 to $30@30. Three years old—$42 to $74@82.

SHEEP AND LAMBS—2,608 at market. Prices—Extra—$5 to $8,00@12,00. By lot—$2,50 to $4,00@4,50.

SWINE—None.

BRIGHTON CATTLE MARKET—June 22.

AT market 575 Beef Cattle, 40 pairs Working Oxen, 80 Cows and Calves, 3,100 Sheep and Lambs, 750 Swine.

PRICES—Beef Cattle—Extra $8,75@9,00; first quality, $8,00@8,50; 2d, $7,25@7,75; 3d, $6,50@7.

Working Oxen—Sales from $85 to $175. Cows and Calves $25 to $62. Sheep—Small lots $3@6,50.

Swine—Shoats, selected, 6½@6¾c; ordinary lots, 5c.—Spring pigs 6@6¾. At retail from 5 to 7½c.

Of all the welcome visitors that pay their respects weekly to our domestic circle, we one is more eagerly received than "Moore's Rural New-Yorker." We have ever regarded it as a model Family Newspaper, and since our first acquaintance with it, now of three years standing, we have never read a single line in it that would offend the most sensitive moral feeling.—*Kalamazoo Gazette.*

WE HAVE so frequently commended the *Rural New-Yorker* that an attempt to add thereto would be like "lending perfume to the rose." In our opinion it is the best Agricultural, Literary and Family paper extant.—*Pa. Herald & Whig.*

Announcement.—A Very Interesting Book Coming!

Will be Published immediately, DANIEL BOONE, and the HUNTERS OF KENTUCKY! By WILLIAM H. ROGART, *Esq. In one elegant* 12mo. *volume, 390 pp. fully and richly Illustrated.*

"INTERWOVEN with the History of the entrance of the Great West into the family of civilized nations, is the career of DANIEL BOONE. It has been the object of the compiler of this volume, to present the narrative of that career in fidelity, and in such light as would rescue the memory of this great man from the common judgment passed upon him, of being only an Indian fighter and a bold hunter.

To DANIEL BOONE, the Great Pioneer of the West—having ever a purpose and a destiny before him—this volume invites the reader."

THE DATE LEAVES;

A HISTORICAL GAME OF FORFEITS, by C. A. BLOSS, Principal of Clover Street Seminary, Rochester, N. Y.; Author of Bloss' Ancient History; Heroines of the Crusades, &c.

Over Four Thousand Packs Sold in the First Ten Days.

The Date Leaves form a system of Social Games, intended for Parlor Amusements, Educational Incentives, or regular School Instruction.

It is believed that they possess all the *social qualities* of Gaming Cards, without that tendency to dissipation which makes card-playing so dangerous to young people. They place the company in pleasant seats, face to face; they inspire mirth, and furnish subjects for conversation; and these subjects are such as excite inquiry and provoke research, and give systematic arrangement to the items of information which float uselessly in the memory.

No person can become acquainted with these Cards without gaining more historical information than he could by a year's reading, according to any method now before the public, and the *readiest* way to become acquainted with the Cards, is to *play* the games according to the directions which accompany the Cards. Price 50 cents. Published by WANZER, BEARDSLEY & CO., Rochester,
232 4t ALDEN, BEARDSLEY & CO., Auburn.

WOOD AND COPPER PLATE ENGRAVING.

MILLER & MIX, Designers and Engravers, No. 10, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of book Illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed at short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. L. C. MIX.

THE HORTICULTURIST.

AND JOURNAL OF RURAL ART AND RURAL TASTE.—The Horticulturist is a Monthly Journal, devoted to Horticulture and its kindred arts, Rural Architecture and Landscape Gardening. It is edited by P. BARRY, late Horticultural Editor of the Genesee Farmer, and author of that popular work, "The Fruit Garden." To those who cultivate Fruit and Flowers, this work is indispensable, as it contains full directions for cultivation, as well as every thing new on the subject, either in this country or in Europe.

The Horticulturist is beautifully printed on the best paper, with costly illustrations on wood and stone. It contains 48 pages, without advertisements, and each number has a full page engraving, on stone, of some rare fruit or flower, drawn from nature, by the best living artist in the line.

TERMS.—Two Dollars Per Annum, In Advance. A discount of twenty-five per cent. allowed to agents. Postmasters and others are invited to act as agents, to whom specimen numbers will be sent, free of postage, on application to JAS. VICK, Jr., Publisher, Rochester, N. Y.

P. S.—A new volume commences on the first of January. January 1, 1854

KETCHUM'S MOWING MACHINE.

THIS machine stands without a successful rival, as *the mowing machine of the age.* The supply will not be equal to the demand. If any person desires one for the coming season, they cannot speak too soon. The uniform price at Buffalo is $110,00. All who will forward us an order accompanied with the cash or satisfactory reference, may depend upon being faithfully served with a machine in good season. H. C. WHITE & CO.,
Buffalo Ag. Warehouse and Seed Store, 11 & 13 West Seneca street, Buffalo, N. Y 211tf.

LAND PLASTER

AT Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.
217-4m. JIREH ROWLEY.

Ketchum's Mowing Machine.—GEO. W. EMERY, 47 Liberty St., Albany, is Agent for the sale of this Machine for Albany and vicinity. Also Seymour & Morgan's New York Reaper. 230-4t

Poetical.

[For Moore's Rural New-Yorker.]

TO A SUMMER STREAM.

BY ANNA M. LANGELAND.

Wind onward, bright streamlet, wind gently away,
The sunbeams are shedding their earliest ray,
Fell swiftly their beams will onward be speeding,
Till they kiss thy bright waters, that glide all unheeding,
The bright flowery gems that thy borders adorn;
For they still hurry by at eve and at morn,
'Twas not thus in the cold winter hours long ago,
When they gazed at the stars, till for. ething to flow
Their warblets were chilling,
Their warbling was stilling.

I have gazed upon waters more famous than thine,
Yet, silver-tooed Huron, I choose thee as mine,
There's a magical music to me in each bower,
That thy footsteps are seeking each moon-lighted hour;
Yet tell me, I pray thee, why speed thus along;
Why not linger 'mid bowers o'erladen with song,
That bright fairy warblers with paradise hues,
Trill forth every morning 'neath diamond-like dews?
Still unheeded their wooing;
What art thou pursuing?

E'en so is the life-stream that hurries me on,
I catch just a glimmer, thro hasty to be gone;
From each happy lower that woos me to stay,
I shall haste like thyself till the cold winter day,
The cold winter of Death my footsteps shall meet,
I shall rest me at last in that wished-for retreat,
While the spirit shall bask in that Aidean Spring,
Whence the pure and the beautiful never take wing;
Where ever abiding,
Life's river is gliding.

I saw thee last night through the moon-lighted sheen
Glide gaily along unheeding the screen,
That Spring had flung o'er thee as some silken veil
That lifts to the breeze at each sighing gale;
Yet the tree that with brightest of blossoms was drest,
Cast as darkly its shade on thy light heaving breast,
As the willow that weeps o'er thy soft flowing stream;
So the shadows that linger from Love's fairy dream,
Shall be dark as a shade
The death-wing hath made.

I would that my spirit might ever pursue
Its unyielding her way 'midst the false and the true,
Unheeding the song that pleasure may sing,
Uncaring the gloom that sorrow may fling,—
Might hasten as swift to a far wider sea
Where shadows ne'er dim the multi-lighted lea:
But Destiny keeps me afar from its wave,
And tone and long is the path to the grave,
Yet I bless thee, bright stream,
For thy light-giving beam.

Milford, Michigan, June, 1854.

Rural Sketch Book.

A PROFESSIONAL SCAR.

BY AN OLD LAWYER.

Your kind letter, Henry, came duly to hand; and you will be surprised to learn that a careless question of yours will draw forth enough to cover a sheet: "What caused that scar on my temple?"

It is a professional scar, Harry; one that I have carried ever since my earliest practice; and although I have now arrived at a tolerable old age, and have many intimate friends, it is a most singular fact that you are the first and only person that inquired into its origin.—I can tell you all about it, but must avoid names and places, for the parties most interested in the incident are yet living, and I am under strong bonds of secrecy.

In the year ——, after passing through an examination before grave judges and shrewd barristers, I was pronounced a properly qualified person to appear before juries and courts for others as well as myself, and at once proceeded to a large southern city, where, by a modest little sign over the door of a modest little office, I announced my readiness to commence the practice of the law. For three months I waited, but alas! no business came, and I sat in my office on a dreary night, at about eleven o'clock, in this very comfortable position: my money was gone entirely; my board bill was to be paid in the morning, and my rent the day following; and I absolutely feared to go to my boarding-house, and waited in what seemed the forlorn hope that something in the way of fee might appear, either dropping from the skies, or suddenly appearing on my desk. Outside, no step was heard; and I occasionally glanced through my window; the flame of the street-light, moved by the wind, would seemingly more no homeward; but I would not go. A footstep sounded in my entry; a second, and a third, and more, but so light that my heart-beating prevented my counting them; and then a little delicate knock. I compelled myself to say "Come in" with a calm voice, although I expected to be vis-a-vis with a young woman; the door opened, and I saw—an old one.

I had only time to move forward a chair before she was in the centre of the room and speaking:

"I have no time to sit. Young man, you are a lawyer; are you good for anything?"

My insulted dignity was controlled by an effort, and I answered that I flattered myself that I possessed some talent for my profession, or I should not have chosen it.

"Well, well, no gas; can you draw a paper?"

Here, again, I ventured to remark, that it depended somewhat on its nature, but I saw from her impatient manner that she wanted no trifling. Before I finished the sentence, she interrupted me with a fierceness of manner exceeding her former rough one, saying:

"I want a will drawn, quick, hurriedly! but so strong that all the furies in h—ll can't undo it! Can you do it?" and she fairly glared at me with impatience for my answer.

Now you know, Harry, that my legal education was obtained entirely in a surrogate's office, and you may presume that on the law and forms of last wills and testaments I felt myself sufficiently posted up. I therefore assured her that I could draw a will which, although I could not warrant it to pass the ordeal she mentioned, would, I was sure, be proof against the efforts of all the lawyers in Christendom.

And now her manner changed from the fierce and bold to the anxious and hurried.

"Come, then, quick! quick! young man, and you shall pocket one thousand dollars for your night's work!" she exclaimed.

And amazed and bewildered as I was, I found myself at the neighboring corner, stepping into a hack, before the startling but comfortable words, "One thousand dollars for your night's work!" had ceased ringing in my ears. My combatress followed me, and without orders we were rattled furiously along the streets to the —— House, then the largest hotel in the city. My visions of one thousand bright dollars kept my tongue bridled, and I was led in silence up two flights of stairs into a suit of rooms comprising parlor and two bed-rooms. The parlor, however, was occupied by a bed, in which lay an old and evidently dying man. A servant was with him, but he left on a motion from the hand of my companion, who approached the bed and said:

"I have an attorney here, sir; shall he proceed?"

The old man's eyes brightened up, and, after glaring on me for a moment, he spoke:

"If you can draw my will, do it; quick, now, for I must save my breath."

I turned to the table, where I found paper, pens, ink, and everything necessary; and by the light of two sperm candles in heavy silver candle-sticks, I was soon busily engaged at the will.

I will not trouble you with the details, nor, in fact, do I remember them; but it is enough to say that a large amount of property, real and personal, bonds, mortgages, etc., were left, in the words of the will, to "my good and faithful housekeeper, Angeline ——, as a token of gratitude for her long, faithful and meritorious service." But the concluding words of the will I shall never forget; they were written from his own mouth, and made me shudder as I wrote them. There was something fearful—yes, devilish—in thus deliberately recording, in what purports to be your last written wish, a curse upon your own offspring. And I felt, as I wrote it, an involuntary desire to tear the paper into fragments, and to rush from the room, but the thousand dollars were like so many anchors, and I staid and wrote:

"I leave to my daughter Dora, all the satisfaction she can obtain from my hearty curse. When rags whip about her in her only home, the street, and dogs share with her the refuse of the gutter, she may regret that she disobeyed him who once loved her, but who, dying, cursed her."

There was something like a chuckle in the direction of old Angeline as the dying wretch dictated these fearful words; but as I looked and saw the stern face as rigid as marble, I concluded I must have been mistaken. I could not, however, divest myself of a certain feeling that all was wrong. A rich old man, accompanied by an old housekeeper, and dying in a strange city, her anxiety to have the will so strong; the curse on his daughter; and the large fee, all conspired to make me feel that I was being instrumental in the accomplishment of some villainous object. Again I meditated the destruction of the paper, and again my fee and my wants conquered. The will was finished, and I read it over aloud, the old man groaning, and the old woman looking an occasional assent; but when I read the terrible curse, a new actor appeared on the scene.

"Oh! tear it! tear it! Oh God, you know not what you do!"

The plaintive tones of that voice touched my heart, even before my eyes beheld its owner; but when I saw her, heavens and earth! what an angel she was! The language is yet undiscovered, Harry, that is competent to give you a description of that face, the eyes dancing with excitement, yet liquid with tears; the mouth proud as Juno's, yet compressed with anguish. But why do I attempt a description? The most majestic, yet the sweetest countenance I ever beheld, appealed to me, and not in vain; for while the old man, drunk as he was, jumped from his bed screaming "Kill her! kill her!" I tore the will into fragments, and we both fell to the floor, he dead, and I stunned by a blow from the heavy candlestick wielded by the old hag, Angeline.

When my consciousness returned, I found myself in my own bed at my boarding house, my host and hostess my sole attendants. My mind was clear the moment I looked about me, and I knew I had been brought home, and was now confined from the effects of that blow. I resolved to keep my own counsel, and ascertain what I could of the subsequent proceeding of the night. Upon inquiry I found that I had been brought home by a young gentleman in a carriage, who had left funds for the employment of a physician, and had also left a letter for me. I opened the letter as I was alone, and found a fifty dollar bank-note, with these words:

"You did last night a deed worthy of more gratitude than our present means enable us to express. The property which so nearly belonged to the infamous hag who struck you will soon be ours; and you shall then hear from us. May the same kindness which prompted you to tear the paper, seal your lips hereafter as to the painful scenes of last evening!

Gratefully yours,
DORA AND HER HUSBAND.

My first act was to conceal the letter beneath my pillow; my second to call my host and tender him the amount of my board bill; to my astonishment he told me that my companion paid when he left the letter. It seemed I raved a little about my inability to pay my host while I was unconscious, and thus the husband of Dora (for I had no doubt it was he who brought me home) had ascertained the fact and paid my bill. Added to this, my wound was not severe enough to need any surgery more than was offered by my kind landlady; so when I recovered, (which was soon) I had only my office rent to pay, and then resumed business with the larger part of fifty dollars in my treasury. I made cautious inquiries about the —— House as to the subsequent movements of the mysterious clients, but could only ascertain that the old couple arrived on that eventful night, the old man ordering a pleasant room in which he could die; that the young couple came by another conveyance, and had taken other rooms; that the old man's body was immediately boxed up and shipped for the north under charge of his man-servant; the young man paid the whole bill, and left also with his wife. To do my worthy host and kind lady full justice, I must say that they never even hinted at the matter, and I never had a question to answer; they probably took it for granted that I had been the victim of some broil, and avoided annoying me by any reference to it.

Thirty years of hard work rolled by, Harry, during which I acquired a family, fortune, name, and grey hairs; but I never, in all that time, saw or heard from my clients, with the exception of one letter, which was received some years after the occurrences which I have related, and which contained two more fifty dollar bills, with the words:

"We are very happy; may God bless you!"
"DORA."

But in all that time, I have never forgotten that beautiful, angelic face, nor the mute appeal which it made to my heart; the answer which cost me the deep scar which is the subject of your present curiosity, and a one thousand dollar fee, less the amount received from the young folks. Neither did I, in all that time, regret the course I took.

Some ten years ago, as you probably remember, I spent a winter in Havana. I boarded with a Spanish landlord, whose house was generally filled with American visitors.—But strange to say, I passed one week without a single American arrival, and I was mentally resolving one day to leave for New Orleans, where I could find troops of friends, and rid myself of the ennui consequent upon my solitary position, when I heard my host calling to me:

"Senor, Senor, los Americanos — Americanos."

Looking from my window, I saw a fine, portly gentleman attending to his luggage, and answering the demands of the thousand and one leeches of porters who each claimed to have brought something for him. Thinking that I might be of service to him, I went out, and with two or three dimes dispersed the villains, who, knowing me for an old stager, submitted to my orders. The gentleman turned to thank me, but suddenly started back, then glanced at my temple, and seeing the end of my candlestick-mark peeping out beneath my sombrero, he caught me by the hand, exclaiming:

"We have met before, sir! how glad I am to see you!"

And then, without explanation, he drew me up to the door-way, in which stood a matronly but still beautiful woman.

"See, Dora," said he, "is not this our old friend?"

At the word "Dora," I started; and there before me, sure enough, stood the Dora of thirty years previous; still retaining many of her charms, but with the marks of time, notwithstanding, impressed upon her features.

You may well believe our re-union was most pleasant; and after dinner was over, and we were out enjoying the sea-breeze, the whole story was told me. I will not give you the details of it; it was long, but the main features of it were about what I had surmised. Dora was the only child of her wealthy father; her mother died when she was a mere child; old Angeline had remained with her father in the capacity of a housekeeper, and had, while Dora was away at school acquired, as is generally the case, complete influence over him. Dora was wooed and won by a poor clerk; the father would not listen to it; an elopement was the consequence; and the old man in his rage broke up housekeeping, and taking old Angeline with him, had started for the South. Dora followed him with her husband, although she knew he would not see her, and although he had always been harsh and unkind to her, yet she knew he was in the last stages of consumption, and she determined, if possible, to be with him when he died. At the time of his death, they had been following him about a month from place to place, keeping concealed from him, and eluding the keen eyes of Angeline. When Dora appeared in the room, it was only because the man-servant, who had been with her father, and who, as you remember, left the room when I entered, had observed their arrival, and had gone kindly to her and informed her that her father could not live an hour; she was entering the room to make one last effort at reconciliation, when my voice recalling the fearful words of her father's curse caused the outcry and the denouement. Her husband, who followed her in, found the old man dead, Dora in a swoon, me senseless, and old Angeline in vain trying to put the many pieces of the will together, raving and cursing like a bedlamite. He and the man-servant put the old man's body into the bed, took Dora to her room, and while the servant kept guard over Angeline, took me home in a carriage. The rest you know.

I have only to add that, whenever I wander north, either alone or with my wife and family, we always stop at the house of our kind friends. They have spent one winter with us at the south, and we expect them again in the coming season. And the young gentleman who studied law under my instruction, and who now practices law with my name on the sign with his (as senior partner, although he does all the business,) is Dora's son, and from certain conscious looks and bright blushing on my pretty daughter's cheek when he calls, I imagine he may possibly be mine, too. But of this, Harry, rest assured—I shall not curse her if she marries him.

THERE is nothing more costly, more ruinous, and more inconvenient, than change of lodgings. Not only things are lost, are upset, are broken, but it has no influence upon the soul; the ideas are deranged, are troubled, and some time must elapse before they assume their first order.—*Ange Pandolfini.*

LITTLE things should not be despised.—Many threads will bind an elephant. Many drops make a river.

Youth's Corner.

ILLUSTRATED REBUS, NO. 28.

☞ Answer in two weeks.

[Written for Moore's Rural New-Yorker.]

AGRICULTURAL ENIGMA.

I am composed of 26 letters.
My 1, 25, 12, 9, 10, 9, 19, 11 is much needed on most farms.
My 3, 14, 21, 15, 18, 23, 9, 7, 13 farmers are too apt to neglect.
My 11, 25, 12, 4, 26 is a delicious fruit.
My 20, 18, 23, 2 is the first principle in stock raising.
My 6, 17, 12, 19 is a condition not profitable for farm stock.
My 8, 9, 25, 3 is sometimes used for fencing.
My 5, 9, 19, 2 is a valuable timber.
My 14, 21, 5, 17, 1 is what ignorant farmers are apt to be.
My 23, 21, 16, 22 was once a prominent farmer and writer in England.
My whole is two cardinal principles in agriculture.

QUESTION.—A man let 1,000 weight of sheep to be doubled in 4 years, but by mutual consent took them again in 3 years. How many pounds should he return? I cannot give the answer, but as it is a proper business question, and never yet satisfactorily solved, (at least to me,) I will be much obliged to any man who will give the proper answer. J. B.

Answer to Illustrated Rebus No. 26.—*Cultivators of the soil can be independent by persevering.*

Answer to Miscellaneous Enigma in No. 25.—*Reading and writing make a full and exact mind.*

Answer to Question in No. 25.—Nos. 7, 21, 66, 198.

Wit and Humor.

"I STILL LIVE!"

LORD BYRON once remarked, "Glory consists of being shot in battle, and having one's name reported wrong in the dead and wounded list."

We never more strongly reminded of the truth of this assertion, and how little the great me remembered after their death, than on hearing a few days since, the following anecdote of an Eastern farmer, trying to repeat the last words of the "Godlike Webster," "I still live!"

A gentleman remarked, "Life is very uncertain."

"Ah, yes," replied the farmer, "that's true, every word of it; and by the way, Captain, that makes me think of what one of your big Massachusetts men said when he died a spell ago."

"Who was it?" inquired the Captain.

"Well, I don't just call his name to mind now, but at any rate he was a big politicianer, and lived near Boston, somewhere. My newspaper said that when he died, the Boston people put his image in their windows, and had a funeral for a whole day."

"Perhaps it was Webster," suggested the Captain.

"Yes, that's the name! Webster—General Webster! Strange I couldn't think on't afore! He riz up in the bed, and says he, 'I AIN'T DEAD YET!'"—*Literary Museum.*

A RESTAURANT in Brooklyn has the following soul-stirring couplet displayed "in characters of living light," on its door-post:

"*This is the spot*
Where good oysters is got"

"I WILL never marry a woman who can't carve," said M.

"Why not?" inquired his friend.

"Because she would not be a help meet for me."

"MY dear," said an Irish gentleman to his wife, "I would rather the children were kept in the nursery when I am at home, although I should not object to their noise if they'd only be quiet."

AN Irishman's description of making a cannon: —"Take a long hole, and pour brass around it."

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

THE FACT that the circulation of the W. G. & S. R. has more than *trebled* during the past two years, and is daily increasing, induces us to venture an enlargement and improvement, which will at once render the work far more acceptable and valuable, if not indispensable, to all engaged in Wool Growing, the breeding of Improved Stock, or the rearing of Domestic Animals generally. Though our arrangements are not entirely completed, we can safely announce that —

On the commencement of its Sixth Volume, July, 1854, the WOOL GROWER AND STOCK REGISTER will be enlarged to THIRTY-TWO PAGES monthly, printed upon new and handsome type, and essentially improved in other respects. The Yearly Volume will comprise 384 octavo pages, or *double* the number contained in the present, (exclusive of the advertising cover, which will probably be omitted.)—This will give ample room for the discussion of many subjects which require attention, but which we can scarcely notice with our present limited space. Among other matters, we propose to publish Pedigrees of pure bred cattle, horses, sheep, &c., and to give the names, residence, &c., of the principal breeders of improved Stock throughout the country—for the mutual benefit of owners and those desirous of purchasing.

Arrangements are making to improve the *quality*, as well as increase the amount of reading matter. Regarding the reliability and value of its CONTENTS as of far more importance than the size or appearance of the paper, we shall endeavor to secure the assistance, as contributors to its pages, of the best and most experienced writers on the various subjects discussed,—and cordially invite the co-operation of all disposed to aid in enhancing its value and usefulness.

Although we hope to double the *value* of the paper, its subscription price will not be increased—except perhaps to clubs of 20 or over. Single copies will be furnished at Fifty Cents—5 copies for $2, and 8 for $3. ☞ The first five volumes, bound in colored paper, will be sent post-paid, and the numbers of the 6th volume as issued, for $3.

The attention of all interested in the subjects and objects of a Stock Journal, is respectfully solicited. The readers of the RURAL NEW-YORKER are especially invited to give the W. G. & S. R. an examination, and, if approved, their encouragement. Specimen numbers, &c., cheerfully sent, gratis, to all applicants. Address

May, 1854. D. D. T. MOORE, Rochester, N. Y.

PURE SHORT-HORN CATTLE.

SIXTY HEAD—Female Calves, Heifers and Cows—descendants of Mr. George Vail's "Duke of Wellington," "Meteor," "Lord Harrington," "Fortune," and "Belvidere." Also, "Prince of Wales," "Lord Marquis," "Sir Walter," "Monk," etc. All first class animals.

Address T. P. REMINGTON,
232-51* No. 22 South Front-st. Philadelphia.

LETTERS PATENT FOR DESIGNS, &c.

PERSONS wishing to obtain U. S. Letters Patent for Designs, are respectfully informed that all the necessary drawings and papers are executed by the undersigned, at the *People's Patent Office*, 86 Nassau st., New York, with dispatch, on very moderate terms.

Under the laws of the United States, Patents are granted for ornamental works and decorations of every kind, such as the ornamental designs upon stoves, walls, ceilings, wood and metal carvings, busts, statues, compositions of all kinds in alto and basso relievo, new forms of jewelry, watch cases, new designs for stamping on woolen, silk, cotton, or other fabric, or for any new impression, label, or ornament, to be placed on any article of manufacture, or any new and original shape or form of any article of manufacture. Such Patents secure to the Patentee the exclusive right to make and vend the same, for a period of seven years, the government fee being $15, gold.

The law for Designs requires the same process in soliciting, as for a mechanical invention, viz.: a model or specimen of the article, duplicate drawings, specifications, claims, &c. All the papers and drawings are executed by the undersigned. For further information, which can be had free of charge, apply to or address

ALFRED E. BEACH,
Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau st., New York. 231-4t

CHAIN HORSE-POWERS, THRESHERS, &C.

ENDLESS CHAIN HORSE-POWERS, Threshers and Riddles, (lately improved,) made and sold by the subscribers, at Central Bridge, Schoharie Co., N. Y. Warranted to suit. Price, for two horse machine, $155.

One of these machines threshed the wheat allotted it for trial, at the trial of Agricultural Implements, at Geneva, in July, 1852, in less time (and gave a better percentage of clean grain,) than any other machine on the ground, considering the amount of power applied.

230-tfeow. C. WESTINGHOUSE & CO.

THE PEOPLE'S PATENT OFFICE

THIS well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with inventors from 9 A. M. to 5 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid,

ALFRED E. BEACH,
Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Inventions and Agriculture. Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Address as above.

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

EMERY'S HORSE POWERS, Threshing Machines and Separators, Circular and Crosscut Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand-use — Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—BRAIN, FIELD AND GARDEN SEEDS, of the best Imported and Shaker growth.

E. D. HALLOCK.

Warehouse and Sale Rooms No. 24 Exchange Street, Rochester, N. Y. 226-tf

MOORE'S RURAL NEW-YORKER,

IS PUBLISHED EVERY SATURDAY,

BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

SUBSCRIPTION—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to Agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the RURAL,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

. The postage on the RURAL is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

ADVERTISING.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance*. The circulation of the RURAL NEW-YORKER is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. MOORE, Rochester, N. Y.

MOORE'S RURAL NEW-YORKER

VOLUME V. NO. 27.} ROCHESTER, N. Y.—SATURDAY, JULY 8, 1854. {WHOLE NO. 235.

Moore's Rural New-Yorker:

A QUARTO WEEKLY

Agricultural, Literary, and Family Newspaper.

CONDUCTED BY D. D. T. MOORE,

ASSISTED BY

JOSEPH HARRIS, in the Practical Departments:
EDWARD WEBSTER, in the Literary and News Dep'ts.

Corresponding Editors:

J. H. BIXBY,—H. C. WHITE,—T. E. WETMORE.

THE RURAL NEW-YORKER is designed to be unique and beautiful in appearance, and unsurpassed in Value, Purity and Variety of Contents. Its conductors earnestly labor to make it a Reliable Guide on the important Practical Subjects connected with the business of those whose interests it advocates. It embraces more Agricultural, Horticultural, Scientific, Mechanical, Literary and News Matter, interspersed with many appropriate and handsome engravings, than any other paper published in this Country,—rendering it a complete AGRICULTURAL, LITERARY and FAMILY NEWSPAPER.

☞ FOR TERMS, &c., SEE LAST PAGE. ☜

Rural New-Yorker.

Progress and Improvement.

RAISE YOUR OWN CLOVER SEED.

Of the great value of clover on all wheat farms we have often reminded our readers.—The most economical method of increasing the acreage production of any wheat farm, is, in our opinion, by growing a large quantity of red clover, and plowing it under or consuming it on the farm, by sheep and other stock, in summer and winter. This is owing to the fact—fully established alike by experiment and common practice—that clover—a leguminous plant—requires for its growth a different proportion of the elements of plants, in the soil, from that required to produce wheat. Peas, beans, tares, and probably other leguminous plants, to some extent require similar qualities of soil to red clover, and, in a good degree, produce a similarly beneficial effect on the fertility of a wheat farm. But our object is not at this time, to enter into a consideration of the *rationale* of this subject, or to recommend the increased cultivation of peas, beans, tares, lentiles, &c. There are some practical objections to these crops, which retard their extensive culture; but clover is, in every respect, suited to American agriculture, it grows most luxuriously, occupying the land, to some extent, conjointly with other crops,—is liable to no disease,—requires no cultivation except what is required for the crop with which it is sown, the only expense being the cost of seed; and our climate is so well adapted to the production of clover seed, and each farmer can raise his own so cheaply, that the expense of growing clover is, or may be, merely nominal. The cost of red clover seed in England, the climate not being hot enough to ripen it, is seldom less than $15 per bushel; and twenty lbs. per acre are frequently sown for the purpose of *insuring* a crop, and, after all, the crop is quite precarious. The turnip crop is called, and most justly, "the sheet anchor of British agriculture." It appears to us that, when all things are taken into consideration, the same may be said, with equal truth, of RED CLOVER on all American wheat farms.

In order to induce farmers to sow as much clover seed as will be to their interest, we know of nothing more necessary than to persuade them to *raise their own clover seed*; for when a farmer has to pay one dollar per acre to the city seedsman, or his neighbor, for seed, he will not be likely to sow so much clover as though he had raised his own seed, at a comparatively trifling expense. We were over a farm a few days ago, where the owner said he paid last spring over $100 for clover seed. On asking him why he did not raise his own, he said that he had "no field of clover but what was too large to be spared, and he had no time to fence off a portion." He was well convinced that it was cheaper to raise his own seed, and agreed with us, that he would sow more land to clover, had he abundance of seed without paying cash for it. There will be, generally, some little difficulty attending raising clover seed; but let every farmer be well satisfied that it is a "consummation devoutly to be wished," to be spared the temptation of sowing less clover seed than his judgment tells him would ultimately be profitable, and every obstacle will give way before an earnest purpose.

The largest crops of clover are generally raised by grazing the clover with sheep till the middle of May, and allowing the clover to grow and go to seed. But the common method is to cut the first crop for hay. In this case the earlier it is cut the better, and if it is mown in showery weather, though the hay will run a little risk of being somewhat injured, yet the second crop will get a good start, and the seed be all the better for it. After the first clover is cut, a bushel of plaster sown per acre, will much improve the growth of the second crop; though, as it has a tendency to prevent early maturity, and as there is much danger from early frosts, it is seldom used. The only injury, however, frost does clover seed is in checking its growth; after the seed is matured, the severest frost will not injure it, so that there is no danger in letting it remain in the field till quite late; and now that we have several excellent machines for taking off the heads of clover seed, thus avoiding the expense and labor of curing the clover in cool and wet weather, it may be left out late in the fall without any loss or inconvenience. Of course, in selecting a piece for clover seed, care should be taken to have it as free from all weeds as possible, for weeds spread rapidly enough without farmers being at the trouble of sowing them with their seed. We repeat, raise your own clover seed, and never, if possible, sow a field with wheat or barley without seeding it down with 10 to 15 lbs. of red clover per acre. It will *pay*, even though you plow it up the next spring.

WILL UNDERDRAINING KILL QUACK GRASS?

WE continue to receive answers to Mr. JOHNSTON's query as to whether "a farmer in the State of New York ever saw quack grass growing on land that was dry," and all without exception in the affirmative. As the communications are similar to those already published, we have concluded to "lay them under the table," and glance for a moment at the positions of the disputants.

We understand Mr. JOHNSTON to assert that Quack, Twitch, Couch (*agopyrum repens,*) or by whatever name it is known, is an "aquatic grass," and that it requires for its growth more water than any other grass, and sufficient to ruin the wheat crop; and furthermore that by thorough underdraining it may be destroyed. To none of these assertions can we fully assent.

There is no evidence that Quack is in any sense of the term an *aquatic* plant, and none has been adduced by Mr. JOHNSTON. That it *delights* in more moisture than our commonly cultivated and nutritious grasses, or than the wheat plant, none will question; but that it *requires* more for its growth we cannot admit. That underdraining alone will kill it, few, we think, can seriously believe; but as this is the point on which Mr. JOHNSTON's position rests, we will consider it particularly, for, if it conflicts with observed facts, it follows that the other assertions are equally faulty.

In introducing a letter from Mr. HILDITCH, an English correspondent, in the RURAL, of May 6th, we observed that the Couch or Quack was the "great pest" of all the light-land farmers of Great Britain, and Mr. H.'s letter was in reference to a new mode of destroying it by double plowing. Now Mr. HILDITCH is one of the best practical farmers of England, and we know that his farm has been for many years *most thoroughly underdrained*; it is, therefore, perfectly evident that if underdraining would kill Quack grass, there would be none on this farm, and the resort to double plowing, instead of several plowings, harrowings, &c., would be unnecessary. Mr. JOHNSTON will admit that underdraining is more generally practiced in Great Britain than in this country, and he cannot but be aware that Quack grass is infinitely more troublesome on British farms than it is with us.

It is certain, therefore, that underdraining will not kill Quack grass. But it is also equally certain that it will greatly retard its growth and extension. This is well understood in England. We well recollect walking over a turnip fallow in the spring with an intelligent English farmer, and observed that about four acres of the field was completely covered over with heaps of Quack grass, which, by repeated plowings, harrowing, rolling, &c., had been worked out of the soil, and were then ready for burning (the burning, with all due respect for our friend's practice, cannot be recommended; for better draw the Quack off and mix it with stable manure and cover the heap with loam; in this way it makes a most valuable compost,) while, on the other portion of the field, there was scarcely any Quack. On asking the reason he said "the couchy part is not underdrained, while all the rest of the field is." This case came under our own observation, but such facts are every where to be met with and are well known. We believe, therefore, that while underdraining will not kill Quack grass, it is one of the best of means for accelerating its extermination by the ordinary processes of summer fallow, and other cultivation, and that Mr. JOHNSTON is more than half right.

ABOUT ROOT CULTURE.

THE following excellent dialogue is from a late number of the WOOL GROWER AND STOCK REGISTER. Those who desire a farther acquaintance with the writer, will find his whittlings in future numbers of the journal named:

Whittling Shingles.

Scene.—Mr. PLOWHANDLE'S front room. *Time*—Just after tea.

Persons.—The EDITOR; JOHN, and his family. The EDITOR commences by apologising to Mrs PLOWHANDLE for whittling in the room. JOHN faults that it's a much more genteel pastime than smoking, as no one is thus compelled to inhale the tobacco vapor which has been blown from the mouth and nostrils of another. The habit of using tobacco, except as a decoction for killing ticks on sheep, he calls vile and filthy. The lady very good naturedly says she likes to have her husband pleased, and to hear him talk, and to confess the truth she says he always talks better when he whittles; besides she has a broom in the other room and knives how to use it. At ten the subject had been roots, and it is again commenced by the

Editor—The fact is, JOHN, you are decidedly stupid. You dislike any kind of labor that requires care. What you can do with your plow or cultivator, is all very well, but any thing that requires hand labor, or patience, you dodge, if possible.

John—Well, I confess to a great dislike to trying to grow any other roots except potatoes. This getting down on your hands and knees and crawling along on the ground all day hunting out young onions, in juvenile carrots, or ruta bagas, and pulling the weeds from them, is a *leetle* too small a business for my big hands and stiff back.

Editor.—But there is very little need of having the weeds get so very troublesome.

John—I should like to know how you can prevent that evil?

Editor—In the first place you should use manure that has been composted and is well rotted, so that no seeds can grow from it. Then you should, if possible, follow after some hoed crop, where the ground has been kept clean.

John—Suppose that can't be done?

Editor—Then sow your seed as soon as you can after preparing your ground, so that the weeds will not get the start of your plants. After my ground is harrowed for the last time, I reverse the harrow and go over it again, which leaves the surface quite smooth. Then with a marker I make the drills, and sow the seed either by hand or with a seed planter. If the seeds come up before the plants appear, I have the ground well hoed over between the rows.

John—But you don't get rid of hand weeding yet?

Editor—No. Nor can it be entirely dispensed with. Yet, if well hoed between the rows it requires but little labor to hand weed, and generally only once if well done.

John—Yes; but that once is the trouble. Besides, to confess the truth, I have no faith in your roots. I had rather have one acre of good Indian corn, than all the roots you can grow in a whole township.

Editor—Did you ever use them any, good JOHN?

John—Yes, sir. Some three years ago, BULL, the Englishman who bought out SLACK, over in the hollow, told great stories about what he had done, and seen done in England with ruta bagas; and to do him justice, he had a fine field of them in the fall. So, to please the children—by the way your WOOL GROWER has turned their heads.

The Children—But it's filled your pockets, father. For it was only last week you were boasting to the neighbors that it had saved you hundreds of dollars.

John—Well, never mind that, now. I put in half an acre, and we harvested full four hundred bushels of as nice bags as you ever saw. BULL came up to see them, and confessed he never saw handsomer at 'one. We had got the elephant, but what to do with him. BULL said they were used for fattening cattle and sheep with great profit. So I tried the *critter*. I fed the oxen, and I fed the cows, but the more I fed them the less fat they got. And the upshot of it all was that I made up my mind I could make more beef or mutton from one acre of corn than all the roots that would grow on the farm.

Editor—Have you tried carrots, and mangel wurtzels?

John—Yes, I have tried them all, and think my cattle, and sheep, and horses would do just as well on hasty-pool sawdust, and snow balls, as upon any kind of roots. The fact is, the whole subject of roots is one of your book farming humbugs, and no mistake.

Editor—So, what is not in your thick head is not worth knowing. Ah! my good JOHN, I should be out of all patience with you if there were not a great many other stupids, besides yourself. In the first place you don't like to raise the roots because it's too much small work—a *puttering job* you call it. And then you don't see any good in it. Your first experiments failed because you did not feed properly.

John—I would like to know why?

Editor—You shall. In England and Scotland the farmers would not be able to pay their rent but for the turnip culture.—I may say root culture for they are not now confined to turnips as formerly, but use the beet, particularly the mangel wurtzel. And the cultivation is constantly extending. Now, the farmers there find that they could not live without the roots.

John—But they have no Indian corn as we do?

Editor—All true. But our corn would not and does not make a good substitute for roots, where it's worth even no more than 50 cents per bushel. Root feeding is but little understood in this country; and great improvements are being made abroad in regard to this subject. Perhaps you will better understand some of the benefits by my giving you the results of some very carefully made experiments by a gentleman in Scotland some two years ago.

He was in the habit of feeding about 250 steers yearly; and one fall he selected 60 from the lot, as nearly alike as possible; these he divided into 10 lots, 6 in each lot. Ten different experiments were tried. Some were fed with turnips or beets, three times a day; some only twice, with hay or straw, or bran meal. They all consumed about the same quantity of roots, but the profit was not in the quantity of the roots consumed, so much as the gain of other feed. One lot in particular he fed with roots morning and night, but at noon he fed each bullock 4 lbs. of cut straw, and 4 lbs. of bran meal *cooked*, and they had no other hay, straw or meal. Others were fed with same, dry, and hay instead of straw. But the result of all was, that the most profit was made upon the lot fed with the cut straw and 4 lbs of meal cooked. And so conclusive were the experiments considered, that the best feeders now adopt the plan of feeding the noon meal of cut straw and oil meal, or bran meal, 4 lbs. of each for each ox weighing from 1,200 lbs. to 1,400 lbs. live weight—and from 80 to 120 lbs. of roots morning and evening. But it is essential to the good condition of the animal that it be kept warm, and it does not require water when fed as that man fed his. It is true that roots alone fatten but slowly. But a light feed of meal with the roots makes the whole more profitable than either alone.

John—This cooking business looks like a great bother to me.

Editor—You only have to cook the straw and meal together—not the roots. It's a small matter for the number you or I should feed. A tub or barrel would hold straw enough for 10 or 15 head of cattle. Set it in the wood-house or swill-room, turn on hot water, stir in your meal and cover it up tight, and the whole would be sufficiently cooked by the time you would want it.

John—I have a good kettle set in an arch in my piggery, and it would be no great trouble to cook for 20 head, if that's all that's necessary to do. But will it pay to feed?

Editor—Now you are sensible, JOHN. That's the question,—*Will it pay?* Much depends upon circumstances. My own opinion is, it will. We must have manure. No manure, no crops; no crops, no cattle; no cattle, no manure. On a good grain farm it will pay if judiciously managed, even if you get nothing for your trouble but the manure.

John—You don't mean that!

Editor—Yes, I do mean just exactly that, and no more. If you can get pay for your grain and straw a fair price, and your money back for your manual, and your net profit is only the manure, I think you are well paid. The manure we must have, and I know of no cheaper method of making or getting it. But if you use *any* kind of judgment in making your purchases, you cannot fail to realize a good profit aside from the manure.

The Children—Well, father, let us try it again. Our hands are smaller and our backs limberer than yours, and if you please, we will raise the roots and corn and feed them this winter to the fattening cattle as the Scotchman did.

Editor—Do, boys, and I will come again next winter and see how you get along. But you would do well to get up a good pile of muck and bogs out of the swamp this summer to litter the cattle with during the winter. It will help you out with your manure finely.

John—I intended to ask your advice about getting my front yard fixed up, what trees to put out, and the best way of doing it, but the confounded roots have taken up all your time. Suppose you stay all night.

Editor—Can't do it now, my good JOHN, but another day we will talk about the trees. So good night all.

THE value of live stock in the U. S., according to the last census, is $600,000,000.

SHEEP DIPPING APPARATUS.

Most of our readers probably know that in Great Britain, especially in warm showery weather, sheep are very much troubled with the maggot-fly, a species of *muscar*. We have known the maggots to make such progress during a few showery days as to kill the sheep, and even if this does not happen, the wool either comes off or is much injured. To guard against this, a week or ten days after shearing, the sheep are dressed with the "fly powder," which generally lessens the evil. Recently, dipping the sheep in some liquid preparation has been adopted with very beneficial results. It kills ticks, keeps off the fly, and, the advertisement says, promotes the growth of the wool.

The apparatus most used for this purpose is the one represented by our engraving, which we saw at the Crystal Palace last fall, and which, we presume, is still on exhibition. It consists merely of a tank somewhat in the form of a common bathing tub, with planks for platforms. Upon the right hand platform is a grating, and as the end of the platform nearest the tub is a little lower than the other end, the liquid which drains from the animal as it is pressed out of the tub, on the grating, will run back by means of grooves in the plank beneath the grating, into the tub. Thus little of the preparation is lost. Five men will dip 500 sheep in a day. Happily our sheep are seldom troubled with these flies, except from grass negligence in tagging, &c. This is probably attributable to our comparatively dry summers, and also to the compact nature of the wool of Merino sheep. Whether the long wooled English sheep are much troubled with the fly here we are not informed. We should judge not, however, otherwise we should have heard of it. Such an apparatus, therefore, is not generally necessary on an American farm. In case of scab or other skin diseases, when it is desirable to apply a liquid preparation it would be found valuable. Any ingenious farmer could make an apparatus of this kind in a few hours.

Communications.

CONVERSATIONS ON AGRICULTURE.—NO. 6.

BY HUGH T. BROOKS.

HAY AND HAY-MAKING.—Having spent some two months of every summer in the hay-field for the last twenty years, I will venture some *practical* remarks on hay-making.

No man, unless he is *quite forehanded*, can afford to mow any other than a smooth surface, free from sticks and stones, and miscellaneous rubbish. If our meadows answer this description, we shall, of course, use the mower and the horse-rake. For a rough surface, especially, where the grass is light, a wheel horse-rake is much the best. A man with twenty or more acres to cut, can afford to own a mower; if he has less, he may try the virtues of combination.

Mowing, more than almost any other work, requires *skill*. The laziest man I ever knew, with the stiffest back, good for nothing else, was the best of mowers. His scythe always had a keen edge, and was hung to a charm. Evidently he had all the requisites to fill a "professorship" under government patronage, and ought to be employed to teach the "young idea" how to mow—a branch of instruction far more useful than many which are honored by legislative munificence. By all manner of means let beginners under *good instruction learn* this art, before they attempt to *practice* it.

Are you ready? Tools in all their variety, some to break and some to lose, and enough for every emergency? Five, ten, fifteen tons of hay down—a sudden shower—all hands to pitching and cocking. Where are the forks? A broken tine with half a handle has earned me (for want of a better) a dollar in half an hour. Have a place for tools, and don't let them out till wanted. Have you twice as many wagons as teams, so that you can in an emergency unload one wagon while you load up another? Wagons are cheaper than teams. If you have a load of hay on, 30 minutes to sundown, you can't in justice to yourself and men, pitch it off and load it again; but if you have another wagon in rig, you can pitch on, and perhaps save a load of hay from the dew or the rain. I have bought old wagons for $10, which have earned me by the above process $20 or more in a single season. It is better to let hay stand on the wagon over night, as it will sweat less when it gets into the mow, and the morning while the dew is on is a good time to clear the wagons.

The time to commence cutting will depend on circumstances. Mow out all the corners of the fences, and the by-places, before the meadows are ready: let nothing be lost. I have seen the time in the winter, when I would mow pretty short grass if I could. The *best* time to cut grass is of short duration. Without a doubt it is from the time grass is in blow, to the period when the seed is fully formed, and is in a soft or milky state. Horses require timothy to be fully out of the blow before it is cut, and I have no doubt it is more nutritious, as well as more free from dust, when the seed is partially formed; the hay is heavier, the juices are less watery and have more consistency, any theory about "saccharine matter" to the contrary notwithstanding. Animals do not live by sugar alone. Sheep require, in the opinion of JOHN C. PAINE, of Covington, and Mr. GLASGOW, of Perry, earlier cutting than horses. They will leave a great deal when the grass is allowed to get ripe, as indeed it should never be for any animal. It is better to cut too early than too late, for grass, after it gets at maturity, wastes faster than it gains before that period.

Hay will be better if cut when free from dew or rain, on the same principle that tobacco is "*sweetest*" when gathered with the same precaution, (I beg pardon of *decent* herbs for bringing them into such disgraceful associations.) If grass is cut wet, or becomes so after it is cut, no time should be lost in stirring it up and giving it air, especially when it is green and heavy, and the weather sultry; otherwise fermentation will commence, as indicated by the loss of color. The less hay is exposed to the sun in curing, the better. If the grass is cut when dry, I would scarcely spread it. Let it remain during the first day in the swath, and at night rake it with a horse-rake; this brings the green side up. If there is danger of rain, cock it; if not, let it remain till the next day, and if necessary turn the winrows, and they will be ready to draw in most cases. Hay requires more drying if it is to be put into stacks—it never should be—than in a mow, and more for a mow than for a shed. Sheds and scaffolds are very convenient for putting in loads that we find it convenient to draw before they are well cured. I sometimes throw in loads quite green, and pitch them over once or twice, and thus make the best of hay. If grain is to be put on to hay, or if it is to be subjected to great pressure in any way, it needs more curing. It requires much artful dodging to get hay in good order, when we have what farmers call a "ketching time," but in this as in war, "prudence is the better part of valor." My father often repeats a rule of great value: "Never leave out a load of hay a minute after it is ready to go in." Slow curing is undoubtedly best; but when it *is* cured, leave every thing else and secure it. Don't wait too long for hay to dry before raking; it dries faster while moving, and in the winrow, than before.

Consult your barometer or *rheumatic pains*, and all other *sure* signs, and if a storm is brewing, prepare for it; every load of hay once cured, which gets wet, will leave you minus from two to ten dollars. In general you will lose half the value of the hay, and all the pleasure of getting it, to say nothing of the extra labor.

A great deal of hay when taken out of the mow, is brown and musty, giving evidence of having been put up too green or too moist.—A little *water* is worse than a good deal of *sap*. If hay gets wet, great caution is required in drying it. The moist parts should be separated and shook out lightly and evenly, and that which has remained dry in the middle of the cock kept from exposure.

There is so much difference in *days*, that the *time* grass has been curing is no evidence of its fitness for curing. Watch it closely, and if you have got a good deal down, shake and turn it, and catch up as soon as possible. It is a difficult and delicate matter to dry hay just enough. The hay crop is of great and increasing value. If it is poorly managed your stock will tell of it.

Pearl Creek, July 1st, 1854.

CULTIVATION OF CORN AT THE WEST.

EDS. RURAL:—In last week's RURAL, I noticed an article on corn-culture, recommending Mr. DARLINGTON'S practice. Being somewhat acquainted with the old system of cultivation in Western New York, I was somewhat surprised that one man had dared to lay aside the old-established practice of hoeing corn twice, at least. Perhaps all of your readers are not familiar with the system generally followed in most of the Western States, which I believe could be profitably adopted in your vicinity, where labor is scarce and high. It is the only mode of cultivation that will pay here; and if it brings good crops at the West, why will it not in Western New York?

Much of the soil here is a clay loam, mixed with sand, and underlaid with limestone, very similar to much of the best wheat lands in Western New York. We have also strips of black prairie land, unlike any there, which is generally preferred to corn, on account of easier cultivation, though clay brings as good a crop of ears, but not so much fodder. Corn is planted, as the ground will permit, from the first of May to first of June. This ground is usually furrowed both ways with a shovel-plow, three feet apart. A boy will drop for a man to cover with a horse and what we call a jumper. It is made very light, and raised up at every hill. It requires some practice to use one well. In this way, two hands and a horse will plant about ten acres per day. As soon as the corn is up, we take our old-fashioned crotch-drag, knock out the forward tooth, and with two horses—one each side of a row—harrow it well, having a boy to uncover. After this, the shovel-plow is the only implement used,—plowing both ways twice in a row, and running very close to the corn. There can be as much skill displayed with a shovel-plow as any other; and such as are skilful can earth the corn as well, and keep down the weeds better, than can be done with a hoe. One hand to plant and tend thirty acres is the custom, and it requires all of his time until the middle of July, when the crop is called secure. Corn on clay lands here, one year with another, will average over fifty bushels per acre; and I think the same plan could be followed in New York with the same results.

J. C. HOLLOWAY.

Grand Prairie, Ohio, June 25, 1854.

MORE GOOD CALVES.—Noticing in the last No. of the RURAL an article taken from the Maine Farmer, describing large calves, I thot it would let you know what could be done in "Old Steuben." I have *two* heifer calves which have been raised from the milk of *one* cow, which at eight and nine weeks old weighed respectively, 230 and 265 pounds. One of them is one-half Hereford, and the other three-fourths Durham. They have had nothing but the milk of the cow and a little grass which has been cut and thrown to them in the yard in which they run. If this can be beat among common backwoods farmers, I should like to know it.—JOHN E. TALLMADGE, *Bradford, Steuben Co., N. Y.*

PULLING STUMPS.—Our plan for pulling up stumps, is to get a pole 20 feet long, stiff and light, which we use as a lever. We then dig under one of the main side-roots, and hitch a very heavy chain around it, and the other end of the chain around the lever; then hitch a good span of horses to the other end, and drive around the stump until it is twisted out. If there are no side-roots, we hitch around the body of the stump by what is called a logging hitch; but in this case the chain must be a strong one.—WM. LAYMAN, *West Liberty, O.*

Agricultural Miscellany.

A BOOK ON FARM IMPLEMENTS.

FARM IMPLEMENTS, and the Principles of their Construction and Use; an elementary and familiar treatise on Mechanics, and on Natural Philosophy generally, as applied to the ordinary practices of Agriculture. With 200 engraved illustrations. By J. J. THOMAS. New York: Published by HARPER & BROTHERS, 82 Beekman street. 1854.

THE basis of this work was originally published as a prize essay on "Agricultural Dynamics," in the Transactions of the New York State Agricultural Society for 1850. It now comes to us as a handsome book of some 270 pages, neatly illustrated with 200 wood cuts, divided into sections to adapt it to the use of schools, and thoroughly revised and greatly enlarged. Those who are acquainted with Mr. THOMAS' previous works need not be told that it is written in a clear, concise, practical style, and, though eminently scientific, the language is so free from all unnecessary technicalities, and so pleasingly familiar, and at the same time so well illustrated and enlivened by appropriate incidents, anecdotes, experiments, &c., as to excite and repay the continued attention of the reader.

It does not contain such a minute or extensive description of farm implements as its new title would lead some to suppose, but is rather a treatise on the *principles* on which farm implements should be constructed. The importance of an intimate knowledge of these principles to every farmer and mechanic is generally admitted, yet how few there are who have any idea even of the rudiments of Mechanics, Hydrodynamics, Pneumatics, &c. After a pretty careful perusal of this work, we can sincerely recommend it to every farmer's son and mechanic as the best work on the subject on which it treats, extant. It is published by HARPER & BROTHERS, New York, and is for sale by all booksellers.

SUMMER AND WINTER FOOD OF COWS.

THE editor of the *American Agriculturist* has recently visited the farm of S. B. HALIDAY, near Providence, R. I. His farm contains 130 acres, part of which is used as a market garden. Of course, land cultivated in this way needs thorough manuring, and a large number of cows are kept "constantly manufacturing milk for the city, and fertilizers for the farm." The cows are soiled—in other words, fed with green food in the stables during the summer months. The following method is adopted:

Mr. H. feeds his cows, beginning in the spring with green rye till the stalks get quite hard, and even after this, if necessary, by cutting them up short. The rye is continued till clover is ready, which forms the next food.—Clover is followed by green millet, which for this purpose, is sown as early as possible in the spring. Corn—sown in drills at intervals of 10 to 12 days—follows millet, and continues till frost, when millet or oats is again resorted to, and used till the ground freezes up.

The winter food of his cows consists of cut corn-stalks, roots, oil meal, and shorts. The daily food of each cow is 2 quarts of oil meal, 4 quarts of shorts, half a bushel of turnips and carrots, and as much cut corn-stalks as she will eat. He says that from considerable experience and observation, he is satisfied that no root contributes so much to the quantity of milk as turnips, while carrots do not add much to the quantity, but greatly enrich the quality. He is quite certain that oil-cake is the best milk-yielding food. He says that in feeding turnips, long-continued practice has proved, beyond a doubt, that a little dry hay, or any dry food, given to a cow just before milking, will entirely prevent any turnip flavor from being communicated to the milk.

SALE OF IMPORTED STOCK.

THE recently imported cattle of the Livingston County (N. Y.) Stock Association, were sold at Avon, June 27th. The stock had scarcely recovered from their long voyage of 50 days—during which 12 out of the 24 shipped, died—but the prices indicate the value of the stock and the judgment of the farmers of Livingston. The sales were as follows:

Madie, 18 months old, $690—Chauncey R. Bond.

Lady Ellington, 16 months old, $400—J. Fireman.

Modena, 10 months old, $360—Hon. C. H. Carrol.

Australia, 16 months old, $615—Chauncey R. Bond, Esq.

Miss Dowly, 10 months old, $625—Homer Sackett.

Fahey, 18 months old, $525—Richard Peck.

Hopeless, 18 months old, $400—C. R. Bond, Esq.

Damsel, 18 months old, $350—Norman Chappel.

Treasure, 2½ years old, $505—Daniel H. Albertson.

Phœnix, 2d, 3 years old and calf $380—Daniel McHardy.

Bull Harper, 3 years old, $1,075—Hon. C. H. Carrol.

Bull Botso, $1 600—J. W. Taylor.

Total amount, $6,925.

ONE correspondent who asked where a good Jack could be obtained, will obtain the desired information by addressing W. H. SLOANE, Tedra, Fulton Co., Ohio. He knows of one 3 years old, between 12 and 13 hands high, of a mouse, or ash color, stout and well proportioned. The price asked is $200.

THE WHEAT CROP.—WEEVIL.

FROM information obtained during the past two weeks—principally from well-informed men residing in various localities—we are of opinion that the present Wheat Crop of Western N. York will prove very light,—nearly a total failure in some sections. If two-thirds, or even one half an average crop is obtained we shall be agreeably disappointed, judging from present indications and apprehensions. Many believe the yield will not be one-fourth that of last year. Not a few farmers in this and adjoining counties have plowed in their wheat, and others cut and cured it for fodder. The weevil is proving very destructive in many localities. For this reason many farmers have ceased working their summer fallows, and others resolved to sow no more wheat for years, if ever. Farmers would do well to try the Mediterranean wheat, which, if sown early, usually escapes the weevil. It makes very fair flour, equal to that of the best spring wheat.

In many sections of Ohio, Michigan and Indiana the wheat crop will prove a partial or total failure. The Ohio papers complain of the ravages of the weevil in the wheat fields of that State. The Mt. Vernon Banner states that in Knox and Richland counties, some fields are almost entirely destroyed by the ravages of this insect. The Piqua Register says, in that vicinity, the wheat that is not protected by a "beard," has been destroyed by the weevil. The Mansfield Herald utters the same note of alarm, and fears that the crop will prove almost a total failure in that region.

WESTERN NEW YORK.

A CORRESPONDENT of the N. Y. *Tribune*, who has just been making a tour through Western New York, says:

In passing through the country south of Rochester, the traveler is surprised at the exceeding beauty and fertility of the land. Take, for instance, the region about Avon, Le Roy, Caledonia, Morganville and Geneseo. I do not now recall such beautiful farms and establishments as here. It is not the unbounded fertility of a western prairie, but a succession of rolling fields and woods, so divided as to give the business of farming a respectability different from the aristocracy of the South, and a rigor quite different from the whip-driven labor of the cotton and rice plantations. Just step into this farm-house in Avon, and examine its neat and easy luxuries. The father has been a hard-working man, but 200 acres of such land keep his treasury full. His children are educated in labor as well as to "polite learning." The mother is as independent and hospitable as any southern matron, and bears her "honors as meekly." Just look out on those fields of wheat, how beautiful they appear, and how nice their 1500 bushels of grain will look by and by when reduced to hard cash in hand! What more is needed by a family?—They have money enough to acquire the refinements of education, travel and social life. The good man might go to Europe with his family without feeling that he was wronging any fellow creature. He is not an exception. There are many like him in this region, and one cannot help contrasting the beauty, fertility, cultivation and prosperity of Western New York with the barrens of Maryland and Virginia, and the superficially cultivated wastes of the South and Southwest. Slaves and the lash would be no advantage to the Genesee country.

In Le Roy, a charming village, there is a female seminary which grew out of the energy of two New England women. One of them was a milliner, and had the generosity to educate her younger sister in the best style. Now they have a seminary quite on the scale of a college, with a corps of accomplished teachers and a large body of pupils, mostly collected from the surrounding region. This of itself is a sign of the prosperity which prevails among the laborers of Western New York, and realizes in some degree the right union of labor with mental cultivation. I love the signs of thrift which free labor has scattered so profusely over this part of the glorious North.

So far as I can see, the crops are very promising, and bid fair to be remunerative, especially at present prices. Wages are very high, corresponding with the prices of breadstuffs.

PROFITABLE SHEEP.—A correspondent at Farmington, Ontario Co., N. Y., writes:—"Yesterday, June 23, I sheared from 19 sheep, 100 lbs. 5 oz. of clean, well washed wool. Said sheep were the remnants of a flock I sold in May, 53 for $4 25 per head, three of them yearlings, the rest 2 and 3 years old. The heaviest fleece weighing 7 lbs. 2 oz; the lightest, 4 lbs. 6 oz."

ANIMAL PORTRAITURE.—What is the matter? What *has* befallen the pictures? We mean the pictures of the animals now getting into the agricultural papers. They are beginning to be awful to look at. The horses seem as if the colic, and the bots, and the gripes, had all befallen them at once. The cattle, as if the hollow horn, and the cold weather, and the ice, had all tackled them. What *is* to pay? We have a fancy that we can scent it. The pictures are now taken by the daguerreotype process; of all processes it is the most villainous, unless the artist knows how; which not one in a thousand does, so far as getting animal portraits is concerned. We think we shall try and go without pictures unless we can do better than some of them. They put us in pain even to think of them.—*Prairie Far.*

FLAX.—A recent traveler thinks we shall become exporters of flax, instead of importers, in a few years.

THE OREGON PEA.

A LETTER from the Commissioner of Patents, describing this new Pea, has been published in the Richmond *Enquirer*, from which we make an extract.

The Oregon pea was brought a few years ago from Oregon Territory. Whether it was found wild there, or was obtained from the Indians, I am not prepared to say. I obtained from the State of Mississippi, a year ago last spring, about a tea-spoonful of seed, from the product of which I raised, last season, thirty bushels of peas. Had it not been for the cut-worm, the ravages of which were very great, I would have raised one hundred bushels.

The seed of this plant is very small, less in size than that of the "Lady, or Sugar Pea," and of a pale green color, with a white "hilum," or eye. It grows on a bush from five to six feet high, with five or six large branches near the ground; and they, with the main stem, put out other branches, until the stalks would make a bunch as large round as a tobacco hogshead, or near it. It grows more like cotton than anything else that I know of, only it is much larger, with branches not so horizontal. After leaving the ground a little, all these branches with those which put out at every joint, bear from four to ten pods in a bunch, with about fifteen peas in a pod, which, as an article of human food, are superior to any thing of the kind I ever eat.

The stalks and leaves, which are very large and beautiful, make, perhaps, the finest hay in the world—stock preferring it to any other—and yield a greater abundance. The hay and pea together are a better and a far cheaper food than can be raised from anything else in the United States, for horses, mules, cattle, sheep and hogs. I believe I can raise more and better food for my stock from an acre of land, than I can from five of any other crop.—It will grow on land so poor that it would produce little or nothing else; and tolerably poor land is better for it, and will produce more than rich land. This may appear strange to some, but it is nevertheless true. Rich land will produce more stalks, but not so many peas. In this respect, it is like cotton. As an improver of the soil, I consider it far superior to clover, or any thing known in Tennessee, when fed off on the ground, and plowed in.

If seed is the object one has in view in raising this plant, let it be sown in drills four and a half feet apart, one or two seeds in a place, a foot asunder along each drill. In the course of the summer, weed and cultivate with the plow or hoe, after the manner of raising bush beans or Indian corn. For fodder or hay, sow them broadcast, and lightly harrow them in, like wheat or other grain.

In short, taking this plant altogether, it is one of the finest and richest productions I ever saw; and I am satisfied in my own mind, that it is the greatest acquisition to the farmers of the valley of the Mississippi and the States adjacent, that has been introduced into this country—guano not excepted—for the last thirty years.

SAVING GRASS SEEDS.

MANY farmers neglect to save their own grass seeds because it needs attention at a time when they are most busy with their grain and hay; but if farmers generally would make it a point to save seed for their own use, they would find their account in it, both in prime cost, and in not being imposed upon by buying foul seed from another man's farm, who had no interest in keeping their land free of weeds.

Orchard Grass is among the first to ripen, and will be ready to cut from the 20th of June to the first of July, according to location and soil. This should be either reaped or cradled and immediately put in compact shocks, to stand a couple of weeks. The stubble may then be mowed and hayed, taking care not to disturb the shocks. When dry, the shocks should be moved very carefully to the barn for storage, as the seed shells out easily.

Kentucky Blue Grass comes in season for harvest about the same time as orchard grass. The best method of gathering the seed of this grass is by stripping the heads by hand: the process is rather slow, but no other way will bring the seed in good condition, as it is too light and chaffy to be thrashed and winnowed. At the price for which it sells in market, even this slow way pays well.

Meadow Fescue (English Blue Grass) is ripe early in July, and having a tolerably heavy seed, can be cut by the cradle or sickle, and when dry, threshed and winnowed carefully to separate the chaff.

Foul Meadow Grass ripens its seed in the last of July. We consider this as the best grass that can be raised for meadow swails and marsh lands. It is fine, nutritious and yields a great burden; and—like a good natured wife—will bear a great deal of neglect without spoiling. When in head, this grass very nearly resembles red top, and is often mistaken for it. The seed is very fine and sells at a high price—as much by the bushel as clover seed, tho' much lighter.

☞ *Timothy seed* ripens in July, and as it is continued in strong heads, is very easily harvested and got out, either by reaping, cradling, or with such a machine as Wagoner's clover harvester, simply taking off the heads. We wish to bespeak the attention of farmers generally to saving the best seeds of these leading grasses.—*Ohio Cultivator.*

LIBERAL APPROPRIATIONS.—The Richmond (Va.) Dispatch says the Council appropriated the handsome sum of $5,000 towards the permanent endowment of the State Agricultural Society, and in addition to the praiseworthy and munificent act, unanimously adopted a resolution appropriating $5,000 more to make such arrangements in and about the Fair grounds as may be necessary to accommodate the Agricultural Exhibition in October.

ANIMALS MUST HAVE SALT. They should either have it constantly or regularly. If supplied only once in a while, they eat too much at one time.

Orchard and Garden.

COUNTRY AND SUBURBAN RESIDENCES.

The *Horticulturist* for July has an able leader on Suburban Residences, from which we condense a few particulars. After stating that the present is eminently an age of improvement,—that the rage for money-making has at length so far abated as to allow men to think of their houses, and to set about making them somewhat comfortable, and even beautiful,—that go where we may, people are busy remodeling their dwellings, laying out gardens and planting trees, &c., &c.,—it points out some of the mistakes committed by merchants or professional men, who, tired of the brick and mortar of the city, build them a suburban residence in the hope of enjoying some of the felicities of country life, and yet be within a convenient distance of their business. The most glaring fault is "a passion for building on the most public thoroughfares, and for making an undue display of the dwelling, and every portion of the ground, to the public.—Now, this is manifestly a mistake. *Quiet and seclusion* we have always regarded as among the most important requisites, and, indeed, the greatest charms of a country or suburban residence." Then, again, the clouds of dust from the street cover every tree, shrub and plant, giving them, at the most delightful season of the year, when gardens should be in the meridian of their beauty, a most dismal and forbidding aspect. We have only room for the following extracts, but commend the whole article to all contemplating the improvement of their dwellings or grounds:

"Something might be done, however, to make these residences on public streets much more comfortable and agreeable than they generally are. The houses might be set further back, and masses of low trees and shrubs might be planted, to exclude the noise and dust, and give them an air of seclusion and quiet. No matter how retired the situation might be, we would plant sufficiently to shelter the interior of the garden, as well as the dwelling, from the wind, and to protect it from intrusion; so that, at all seasons, and at any time of the day, any member of the family might work, or amuse themselves as they saw fit, without being observed. Very few gardens are sufficiently sheltered. In the north, high winds prevail during the early spring months, so that, unless shelter be amply provided for, it is impossible to cultivate spring flowers successfully, or for ladies, or persons in delicate health, to enjoy daily the pleasures and recreations of a garden at that season.

Farmers' gardens and dwellings are, as a general thing, sadly deficient in shelter and protection. The house is usually placed, for convenience, close to the highway, and the garden and door-yard inclosed with low, painted board fences. A row of trees, along the street, is all that seems to them necessary; and the consequence is, there is not a spot that can offer pleasant out-door recreation until summer arrives. Why can they not plant, on the exposed sides of their residences, thick belts of forest trees, to break off the winds, and inclose their gardens with high board fences, or what is much more sightly, Arbor Vitæ screens.—Ladies, children, or infirm persons, who may desire out-door exercise, would then have some opportunity of enjoying it with safety and comfort. This provision for shelter, on an ample scale, should be one of the earliest cares of every man who goes about the work of improvement in our boisterous climate, where we have winter full half the year. It is a great sacrifice to people who live in the country, or in the suburbs of a city, to be shut up in the house six whole months together. Winter walks and resorts need to be provided more than summer, because in summer almost every place is pleasant in the country.

We do not propose to recommend that people should inclose their gardens with high walls, as though they were prisons, or to surround them with thickets of trees to such an extent as would give them an air of exclusiveness, obstruct their views beyond their own boundaries, or impede too much the circulation of air. These extremes are as much to be guarded against as that of too great exposure. There is a medium which every person of good sense will discover, if they but give the subject due reflection.

* * * Rapid-growing trees, such as Silver Maples, Pawlonias, European Larch, and Norway Spruce, will make an effective obstruction in three or four years. If the grounds be too small to admit trees of such large size, then live hedges, such as Thorn, Osage Orange, Buckthorn; or evergreens, such as Arbor Vitæ, Hemlock, Red Cedar, or Spruce, all of which may be allowed to grow up (for a screen), without shearing, except on the sides."

THE ROSE-COLORED WEIGELIA.

This beautiful flowering shrub, somewhat recently introduced from China by Mr. Fortune, proves to be a most valuable acquisition.

Mr. Barry speaking of it, says:—"It proves perfectly hardy at Rochester, having stood the past severe winter (1852) entirely unharmed, and bloomed profusely in the month of May. The plants were young, too,—only one season's growth from cuttings. The flowers are in shape similar to the foxglove, of a beautiful deep rosy crimson, changing to a blush. The later and earlier expanded flowers produce a fine contrast, which is one of the charms of this elegant shrub worthy of note. It makes a pretty spreading bush, in foliage

THE ROSE-COLORED WEIGELIA.

resembling a syringa. It is propagated quite easily from cuttings of the young wood, or from layers."

Mr. Horsy, of Boston, also speaks of it in terms of high praise. It blossomed well, and "small plants standing in a cold, damp locality, did not have so much as a single shoot injured."

The following is Mr. Fortune's account of its discovery:

When I first discovered this beautiful plant it was growing in a Mandarin's garden, in the island of Chusan, and literally loaded with beautiful rose-colored flowers, which hung in graceful bunches from the axils of the leaves and the ends of the branches. The garden, which was an excellent specimen of the peculiar style so much admired by the Chinese in the north, was often visited by the officers of the regiment who were quartered at Tinghae, and was generally called the Grotto, on account of the pretty rock-work with which it was ornamented. Every one saw and admired the beautiful Weigelia, which was also a great favorite with the old gentleman to whom the place belonged. I immediately marked it as one of the finest plants of Northern China, and determined to send plants of it home in every ship until I should hear of its safe arrival."

A CLAY GARDEN.

Some of the knowing ones say, "make no attempt to mix sand with greasy, calcareous clay, as it will only turn it into a harder mortar." Very true, but if you mix into this mortar plenty of coarse, stable manure, tan bark, saw dust, fine chips, &c., you have, in a very short time, a soil with all the constituents of the river bottom, porous, yet mellow, and capable of holding more water mechanically and by capillary action, than the best conditioned sandy loam deficient in alumina.

Such a soil, however well under drained it is, will not bring peas quite as early as a coarse, sandy loam, because it is more impervious to the quickening rays of the sun, so necessary to the earliest spring vegetation. But, on the other hand, it will stand a drought much better than sand, besides, it will nature a much heavier crop of corn, cabbage, beets, &c., &c.

Weeds in a clay garden may be made to perform the same office that green clover does in the fallow, by ameliorating the texture of the soil, while it adds to its fertility. I always allow a large patch, intended for late sweet corn, &c., to grow up with weeds; as nature hates a vacuum, so she does a naked fallow; before the first of July, these long weeds are turned under with the spade, and corn is planted; true, in an ordinary field, such a crop would fall a prey to the drouths of July and August; but my weeds, and previously turned in long manure, are my watering pots, and rain or shine, I never fail to get full ears by or before the 10th of September.

I have often thought that if farmers would follow nature's example more understandingly, and pay less attention to the prescriptions of empirics, or to the horns of the crazy moon, they would be more in love with truth, and farm better.

Now, on this 24th day of June, I have rows of corn two inches high and other rows in tassel, in close proximity, like tropical fruit; the soil between the rows is as mellow as an ash heap, and a shade darker; had I eschewed nature's process of re-constructing with the debris of vegetation, and applied Mapes' concentrated superphosphate in its stead, I take it my garden would not then resemble, as it now does, nature's choicest formation, with vegetation to match. S. W.

Waterloo, June 24th, 1853.

Pomegranates are readily propagated by cuttings, layers, suckers or seeds. When by seeds, they should be sown directly after they ripen, otherwise they seldom vegetate. Any good rich garden soil answers well for the Pomegranate, and thin out old or decaying branches occasionally.

THE VALUE OF A GARDEN.

The Hon. T. C. Peters, in his address delivered, last fall, before the Tompkins County Agricultural Society, thus eloquently speaks of the pleasures and associations of gardening:

But I hold that any farmer, who is worthy of the name, will prepare a small plot of ground for wife and daughters, and that he will, out of love to them, make it all they can wish or desire. It is these little things that make home pleasant and happy; and it has been the lack of these that has driven many a loving heart out into the world, and away from a sterile, barren home. Give the wife and daughters a place to plant, tend, and rear their flowers; help them, if needs be, although it may take an hour sometimes that it is hard to spare, and you will a thousand times bless God for so ordering your mind that you did it.—What husband or father, rugged though his nature may be, does not fondly linger around a home made so bright and cheerful by the fairy hands of his wife or daughters, scattering, as it were, in his way, the beauties of their little plot?

What son or brother ever forgets his home who has found his room daily perfumed with the flowers which have been raised by the hand of a fond mother or gentle loving sisters, and placed there through the promptings of their own dear affectionate hearts? What daughter ever forgets the home where she has cultivated her little garden, and year after year been so happy in the blossoms which have been borne upon the plants she has watered and tended with such patient care? Parents, brothers, sisters, the dear old home, all—all come back to her, though years may have passed away, in the scent or bloom of every flower. That family is seldom unhappy whose dwelling is surrounded with shade trees, and whose garden is gay with the blossoms of cultivated plants. Do not, then, I beseech you, forget the little flower garden.

GARDENS THAT NEVER FAIL.

"My garden failed last year, owing to the drouth," was the remark of a friend of ours, when apologizing for the slovenly appearance of the patch of ground which he dignified with the name of *garden*, and in which, each year, after plowing and harrowing the ground, he is accustomed to plant cabbages, onions, beets, cucumbers, melons, &c., for the supply of his family; but the soil being clayey, and not over five or six inches in depth, with a compact sub soil beneath, the crops were of course liable to dry up in such a season of severe drouth as was last year in June; and as such seasons are by no means unusual in this climate, it is good policy for every one who has a garden or vegetable patch, to adopt such a system of culture as will prevent the danger of failure from this source.

Deepening the soil is the only effective means of protection against failure from drouth. Plow or spade up the sub-soil in the fall, so as to expose it to the mellowing effects of frost, say to the depth of a foot at least, and if deeper so much the better, adding a good supply of stable manure; the crops will then push their roots so deep, and moisture will rise from below so constantly, that while other gardens around may fail from drouth, this will continue green and flourishing; and the increased yield as well as improved quality of its products will in a single year almost or quite pay for the improvement.

Cucumber, melon, and similar vines appear to have small roots, but their roots run very deep if opportunity is offered them. Experienced gardeners will not fail to give them *deep* as well as rich ground, in this sunny climate where drouths are so frequent. The same is true of cabbages, and in short nearly all kinds of garden vegetables. The directions for the culture of such things as given in most books on gardening, are written by persons unaccustomed to so dry and warm a climate as ours, and hence are deficient in not sufficiently insisting upon deep culture as a preventive of injury from drouth. We find it necessary to give "line upon line" on this subject.—*Ohio Cultivator.*

Garden Mice.—Coal ashes, sifted very fine, and an inch thick, and four inches wide, over the rows of peas and beans, are an effectual barrier against these marauders.

Those plants which produce seed the first year of their growth, and then die, draw away the substance of the root to mature the seed.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending June 21, 1853.

Jonathan Amory and Wm. P. Parrot, of Boston, for improvement in the furnace of steam boilers.

Jesse Rayman, Shepherdstown, Pa., for improvement in cider mills.

Chas. H. Beatty, Wheeling, for improvement in coffee mills.

S. Oscar Cross, Kingsbury, N. Y., for improved grape frame.

Thos. H. Dodge, Nashua, N. H., for improvement in gas and liquid regulators.

Geo. Esterly, Hurd Prairie, Wis., for improvement in grass-harvesters.

Jno A. H. Ellis and Alex. Gordon, Rochester, for improvement in reversible capstans.

J. Durell Green, Cambridge, for improvement in breech-loading firearms. Patented in England May 12, 1851.

William Hall, Boston, for improvement in bank locks.

Daniel Hill, Burlonia, Ind., for improved seed-planter.

Julius Hotchkiss, Waterbury, Conn., for improvement in manufacturing suspender ends.

Walter Hunt, New York, for improvement in sewing machines.

H. M. Johnson, Carlisle, Pa., for improved rotary cultivator.

D. W. Kennedy, Staunton, Va., for improvement in drying cloth.

Geo. W. La Baw, Jersey City, for improved mitre machine.

Alex. B. Latta, Cincinnati, for improved hydro-pneumatic force pump.

John McF. Lyeth, of Baltimore, for Improvement in Rifles.

Wm. Mallett, Brooklyn, for improved regulator of gas burners.

Wm. Mullder, Brooklyn, for improvement in gas burners.

John H. McGowan, Jr., Cincinnati, for improved double acting force pump.

John Melenly, Southbridge, Mass., for improved fruit-picker.

Daniel Minthorn, New York, for improvement in inhaling tube.

Wm. J. Miller, Cold Spring, for improvement in machines for cutting brads.

Thomas Penrose, Ellington, Ill., for improved road-scraper and spreader.

T. H. Pravey, South Moulville, Me., for improved charger for firearms.

Oliver Pier, Harmony, N. Y., for improved trap for animals.

L. L. & A. L. Platt, Newtown, Conn., for improvement in the manufacture of wooden buttons.

Hiram and Simon H. Plumb, of Honesdale, for improved mortising machine.

H. D. Sanders, Hollitay's Cove, Va., for improvement in winnowers of grain.

Wm. H. Sanders, Hastings, N. Y., for improvement carriage axle.

Pearly Seaver, Oxford, for improved calipers.

Isaac Strub, Cincinnati, for improvement in grinding mills.

Thos. Sumner, Patterson, for improvement in steam hammers.

Hartwell L. Turner, Strykersville, N. Y., for improved head gate for water-wheels.

Enoch Thorn, Philadelphia, for improvement in ventilating sewers.

Philo Washburn, H. G. O. White and Geo. A. Copeland, Taunton, Mass., for improvement in collins.

Henry Weed, Philadelphia, for improved mode of constructing wire bonnet frames.

Wm. E. Woodbridge, Perth Amboy, assignor to Charles Humphrey, of same place, for improvement in whistling tops.

Wm. F. Collier, Worcester, Mass., assignor to himself and Jos. Bayden, of same place, for improved machine for feeding paper to printing presses.

Milton D. and Lyman W. Whipple, of Somerville, Mass., assignors to Lyman W. Whipple and Robert B. Fitts, of same place, for process of engraving or printing upon glass.

F. C. Goslin, New York, assignor to Alfred B. Ely, Boston, for powder chamber to doors of safes and bank vaults.

David Brown, of Baltimore, assignor to Jno. F. Clark, Washington, D. C., and David Brown, aforesaid, for improvement in machines for moulding for metal castings.

Ira Carter, Champlain, for improved pump.

Aug. F. Dalsin, New York, for improvement in milk and other evaporators.

Jas. Eberhardt, Philadelphia, for improvement in the preparation of archil.

Henry B. James, Trenton, N. J., for improvement in smut machine.

Alfred D. Kelley, Rochester, N. H., for improvement in hoel cutters. Ante-dated 20th March, 1851.

Edward Lindner, New York, for improved magazine, repeating and needle gun.

Abner N. Newton, Richmond, Ind., for improvement in breech and loading fire-arms.

James Noble, Leeds, England, for improvement in combing cotton and other fibrous materials.

Thomas Pearsally, Smithboro', N. Y., for ventilated flour barrel.

Jacob Stevenconb, Potetourt Springs, Va., for improvement in plows.

Philos B. Tyler, Springfield, Mass., for improvement in carriage machinery.

Abraham Gesler, Williamsburg, assignor to the "Asphaltic Mining and Kerosene Gas Company," of New York, for improvement in Kerosene burning fluids.

RE-ISSUES.

Henry G. Bulkley, of Kalamazoo, for improvement in drying grain. Patented March 2, 1852.

Isaac M. Singer and Edward Clark, of New York, assignees of Charles Morey and Joseph B. Johnson, of Boston, for improvement in sewing machines. Patented Feb. 6, 1849.

Lasting Effects of Heat.—The French during the time their army remained under Bonaparte in the Holy Land, constructed two very large ovens in the castle of Tiberias. Two years had elapsed at the time of our arrival since they had set fire to their granary; and it was considered a miracle by the inhabitants of Tiberias, that the combustion was not yet extinguished. We visited the place, and perceived that whenever the ashes of the burned corn were stirred by thrusting a stick among them, sparks were even then glowing throughout the heap, and a piece of wood being left there became charred. The heat in those vaulted chambers where the corn had been destroyed was still very great.—*Clarke's Travels.*

LUBRICATING SUBSTANCES.

Lubricating substances, as oil, lard, and tallow, applied to rubbing surfaces, greatly lessen the amount of friction, partly by filling the minute cavities, and partly by separating the surfaces. In ordinary cases, or where the machinery is simple, those substances are best for this purpose which keep their places best.—Finely-powdered black-lead, mixed with lard, is for this reason better for greasing carriage wheels than some other applications. Drying oils, as linseed, soon become stiff by drying and are of little service. Olive oil, on the contrary, and some animal oils, which scarcely dry at all, are generally preferred. To obtain the full benefit of oil, the application must be frequent.

According to the experiments made with great care by Morin, at Paris, the friction of woolen surfaces on wooden surfaces is from one-quarter to one-half the force applied; and the friction of metals on metals, one-fifth to one-seventh—varying in both cases with kinds used. Wood on wood was diminished by lard to about one-fifth to one-seventh of what it was before; and the friction of metal on metal was diminished to about half what it was before; that is, the friction became about the same in both cases after the lard was applied.

To lessen the friction of woolen surfaces, lard is better than tallow by about one-eighth or one-seventh; and tallow is better than dry soap about as two is to one. For iron on wood, tallow is better than dry soap about as five to two. For cast iron on cast iron, polished, the friction with the different lubricating substances is as follows:

Water	31
Soap	29
Tallow	10
Lard	7
Olive oil	9
Lard and black-lead	5

When brouze rubs on wrought iron, the friction with lard and black-lead is rather more than with tallow, and about one-fifth more than with olive oil. With steel on bronze, the friction with tallow and with olive oil is about one seventh less than with lard and black-lead.

As a general rule, there is least friction with lard when hard wood rubs on hard wood; with oil, when metal rubs on wood, or metal on metal—being about the same in each of all these instances.

In simple cases, as with carts and wagons, where the friction at the axle is but a small portion of the resistance,* a slight variation in the effects in the lubricating substance is of less importance than retaining its place. In more complex machinery, as horse-powers for thrashing-machines, friction becomes a very large item, unless the parts are kept well lubricated with the best materials.

Leather and hemp bands, when used on drums for wheel-work, should possess as much friction as possible, to prevent slipping, thus avoiding the necessity of tightening them so much as to increase the friction of the axles.—Wood with a rough surface has one-half more friction than when worn smooth; hence moistening and rasping small drums may be useful. Facing with buff leather or with coarse thick cloth also accomplishes a useful purpose. It often happens that wetting or oiling bands will prevent slipping, by keeping their surfaces soft, and causing them to fit more closely the rough surface of the drum.—*Thomas' Farm Implements.*

* If the friction at the axle be one-twelfth of the force, and the diameter of the wheels ten times as great as the diameter of the axle, the friction at the axles will be reduced to one-twelfth of a tenth, or one hundred and twentieth part of the force, according to the Law of virtual velocities as applied to the wheel and axle.

M. Delaude, of Paris, has presented an invention which consists in certain processes for producing a new metallic alloy similar in silver in appearance, and intended to supersede it in various applications. Tin forms the base of the composition, and to prepare it, the inventor calcines it two or three times with saltpetre, and reduces the calcined part to powder, which is melted down in a crucible. When in a fluid state it is purified by being mixed with charcoal powder, the clear part being drawn into another crucible, ready for use.

An individual in Santiago de Cuba has discovered a method to divest rum of that disagreeable flavor peculiar to it, converting the liquid into a pleasant beverage, similar to wine.

Domestic Economy.

Puff Pudding.—1 quart of milk, 4 eggs, 9 table-spoonfuls of flour, 1 salt-spoonful of salt. Bake as long as any pudding.

Lemon Pie.—Remove the rind of one lemon, cut fine, add one cup of sugar, one-half cup of cream, and one egg.

To Secure Bacon from the Fly.—A writer in the American Farmer recommends as an infallible remedy against the fly:—When your bacon is smoked early in the spring before the fly has made its appearance, take quick-lime slackened to a dry powder, and rub the meat thoroughly on every part with it, leaving it to adhere as much as possible; hang up your meat, and rest secure from any trouble from insects. We have for many years rubbed our hams with hickory wood ashes, and then packed them up in the ashes in close casks, with tight-fitting tops, and we have yet to find the first insect in our bacon. We think ashes preferable to lime, and are much pleasanter handling in packing away, or in getting rid of when the hams are required for use.—*Germantown Telegraph.*

Indian Cake.—Take three cups of Indian meal, two cups of flour, one-half a tea-cup of molasses, a little salt, one tea-spoonful of saleratus, and mix them with cold water.

To Cure Hams.—Take of rock-salt, nine pounds; saltpetre, six ounces; molasses three pints—for one hundred pounds of meat. This is a simple but excellent receipt.

Educational.

(For the Rural New-Yorker.)

RECOLLECTIONS.

When I turn aside from labor
In a meditative mood,
Bid dull care, that vexing neighbor,
Not molest my solitude;

Memory bringeth forth her treasures
Culled in days long past and gone,
When I shared an urchin's pleasures,
Ere to riper age had grown;

Of the glassy, sliding places
On the silent frozen pool,
And the ruddy, gleeful faces
I was wont to meet at school.

Then I think of the old benches
Made of slabs from oaken log;
And the taxes, jerks, and wrenches,
From the master Pedagogue;

Of the shouts of laughter pealing,
Driving ball, and hoop, and top;
Of the kite so proudly sailing,
Of our games of skip and hop;

Of the famous quarter dollar,
Strung by bit of cotton braid,
Worn home nightly by that scholar
Who in spelling was the head.

'Tis to me sad contemplation
That those gleeful days have flown,
And against my inclination
To maturer years have grown.

Let them tell of proud ambition,
Or of youth's gay flowery path,
Or of honor's high position,
Or the joy which riches hath.

Give me life when unannoyed
By the blighting hand of care;
Joys are ne'er so unalloyed,
As in childhood's morning fair.

WILLIE WATSON.

DOES SCHOOL-TEACHING SOUR THE TEMPER?

Most people interested in the subject of popular education, and most boys—especially mischievous ones—cannot fail to have observed, that the man who has labored long and arduously as a common-school teacher, and the woman who has exhaled the dew of her youth amid the trying duties of a school-room, are quite apt both to have lost much of their original placidity of temper, and to have become restless, excitable, easily ruffled, and fretful in disposition. This is not always the case, but the tendency seems to be that way; and the question naturally suggests itself, whether common-school teaching in the abstract, and divested of external and concomitant influences, inevitably leads to such unhappy results.

School-teaching is regarded through the community as a severe and trying occupation, and it is resorted to, generally, only as a stepping-stone to some easier, if not nobler, employment. The pay is usually too small to be considered an inducement to long continuance in that line of duty; and the teacher looks forward to the time when he shall shuffle off the robe pedagogical, and assume one more congenial to his tastes and aspirations. In the meantime his cares and burdens increase; a family, perchance, comes up dependent upon him for support; he just manages to make the year come round, or perhaps not that; and as he glides down into the vale of years, his day-dreams of greatness vanish away. After years of toil and anxiety, he finds himself a teacher still, without an inch of advancement in worldly wealth or worldly prosperity.—Younger, more active, and more ambitious members of the fraternity rise up,—men who have had the advantage of him in point of education, for the world is progressive, and education, as well as other things, improves. He is regarded as an old fogy, and behind the age; and is either pushed entirely to the wall, or shoved back to some of the inferior and ruder schools, where birch and ferrule are more in demand than literature and science. His pay is cut down, or is not advanced with that of his contemporaries; and a feeling of disappointment, and a sense of ill-requited labor, comes over him, that makes the whole head sick, and the whole heart faint.

These outside influences tend much more to sour the temper of the teacher, than all intrinsic causes combined. In our colleges, and endowed literary institutions of a higher grade, where the professors are not subjected to exhausting, ceaseless, and ill-requited toils, where only two or three recitations, at the outside, each day are required, and even those in a special department, and where the pay, if not extremely liberal, is at least above a respectable living limit, and guaranteed to the incumbent *se bene gesserit*, the temper of the instructor does not undergo the *ascetic fermentation* in time, but grows calmer and serener as years go by. Grey-headed and venerable old men, who have taught in many of our best colleges for years, are as calm and unruffled as an undimmed sun, and enjoy a dignified joke, or an amusing incident, with the freshest student in the institution. In our common schools, the nearer an approach is made to liberal compensation, long tenure of office, an independent position, and an amount of labor that permits of ample time for recreation and self-improvement, the less and less will the unhappy propensities of teachers appear, until those propensities die out for want of the poisoning nourishment they feed upon.

PREMISES AND CONCLUSIONS.

When I see parents confide the moral and mental training of their children entirely to the school-teacher, unobserved, I conclude they themselves need guardians, and deserve the strait-jacket.

When I see parents or school-teachers use the rod, sharp words, or angry reproof, to reclaim from error and correct faults, I conclude they are deplorably ignorant of mental philosophy, or unable to deduce consequences from causes.

When I see a person highly entertained with folly, mistaken for fun, I conclude the mental capacity approaches the lower order of intelligence.

When I see young people engaged in *jejune* employment, for recreation and amusement, I conclude that true principles of instruction were contravened in their education, and *knowledge* was taught, instead of *wisdom*.

When I see people pretending to respectability, engaged at cards, and similar games, in the back parlor, with the curtains down, who hide their hands, and even heels, at every approaching sound,—"who know the right, and yet the wrong pursue,"—I conclude they are morally dishonest enough to desire to play a double game of hypocrisy, and lack moral courage sufficient to openly pursue a course of conscious rectitude.

When I see a conductor of a railroad train more ready with excuses for neglect, than will to perform his requisite duty, I conclude he is out of his proper sphere of usefulness, and would be far better employed as lumberman.

EXPERIENCE AND OBSERVATION.

Marcellus, June 20, 1854

SCHOOL-TEACHERS OF THE CITY.

The number of teachers employed in the several school districts of this city, are as follows:—No. 1, three teachers; No. 2, six; No. 3, six; No. 4, three; No. 5, six; No. 6, eight; No. 7, three; No. 8, two; No. 9, six; No. 10, five; No. 11, three; No. 12, five; No. 13, five; No. 14, eight; No. 15, three; No. 16, five; No. 17, three; Colored, 1; Music Teacher, 1. Total, 82.

CONNECTICUT SCHOOLS.

Norwich.—In this enterprising city, through the persevering efforts of Rev. Mr. Gallaher and others, the liberal, or rather, we should say the magnificent sum of $75,000, has been subscribed for the endowment of a free high school, which shall be second to none in the country. When its plans are matured, we hope to lay them before our readers.

Nor is this all. The citizens of Norwich have taken another important step in the improvement of their schools. They have consolidated their districts, and made liberal appropriations for the erection of suitable buildings for the accommodation of their grammar and primary schools.

Stonington.—Mr. W. S. Baker, the well-known educational lecturer, was employed in this town for several weeks during the past winter, and we are happy to learn that his labors have been well received. The districts of the borough have been consolidated, and a vote passed to build a union school-house of the first class. That is glory enough for one year.

Old Saybrook.—The cradle of Yale College, "the wealthy town," the pisentory paradise, whose "banks" discount annually, during the months of April and May, an abundance of the finest shad—even Old Saybrook is touched by a spirit of progress. The establishment of a union school is agitated; the old school-houses have been condemned. The citizens are beginning to feel the need of a better provision for the education of the rising generation.

New Haven.—We have the pleasure of recording another step of progress in this enterprising city. At a full meeting of the citizens, the sum of $29,000 was voted for the erection of another first-class school-house, large enough to accommodate six hundred pupils.

New Canaan.—The three districts into which this village was divided have been united, and a tasteful and commodious school-house has been erected for the accommodation of the union school about to be organized.

Waterbury.—This is probably the *smartest* city in all New England. Old fogyism cannot breathe there. The spirit of Young America seems to animate the very gravel in her streets. They have abolished the odious system of rate bills, and voted a tax on property for the support of schools.

Middletown.—This city is so compact that nearly all the children might easily assemble at one point. She ought to have such a school-house as the people of New Haven are about to erect, and organize in it a grand union school. Her high school is preparing the way for improvements in the lower schools. Her conservatism is evidently beginning to yield to the spirit of improvement.—*Conn. Common School Journal.*

School Salaries in Buffalo.—The principal of the school receives $900, and the assistants in the second department, $350. The principal of the high school has $1,000, and his assistants $350. The itinerant writing master has $1,000, the singing master, $900, and the superintendent, $1,500.

To despise our own species is the price we must too often pay for a knowledge of it.

The Essayist.

THE OSTRICH.

The Ostrich is one of the largest, as well as one of the most remarkable specimens of ornithology. It measures seven or eight feet in height, and weighs seventy-five or eighty pounds. As might be expected, so ponderous a bird is incompetent to fly, but as a compensation for inability of wing, it is endowed with the most powerful muscular action of the body and legs, enabling it to outstrip in the chase,

the fleetest horse. It is a native only of the torrid regions of Africa and Arabia, and has never been bred out of those countries, which first produced it.

This bird, so disqualified for society with man, inhabits, from preference, the most solitary and horrid deserts, where there are few vegetables to clothe the surface of the earth, and where the rain never comes to refresh it.—The Arabians assert that the ostrich never drinks; and the place of its habitation seems to confirm the assertion. In these formidable regions they are seen in large flocks, which to the distant spectator appear like a regiment of cavalry, and have often alarmed a whole caravan. There is no desert, how barren soever, but is capable of supplying them with provision; they eat almost everything; and these barren tracts are thus doubly grateful, as they afford both food and security. In Southern Africa they are exceedingly injurious to the farmers, as they will destroy a field of wheat so effectually as not to leave a single ear behind; and this operation they perform without danger to themselves, as they are so vigilant and swift, that it is almost impossible to get a shot at them.

The plumage of the Ostrich is in great request for ornaments throughout the world, and is worn in profusion by all classes, from a Field Marshall to a Fourth Corporal, and from a princess to the belle of the remotest rural village. It is surpassingly beautiful, and capable of producing a greater variety and combination of ornaments, than any other animal production. Tastefully arranged and appropriately used, the plumage has a very pleasing effect as an ornament; but inappropriately or distastefully called into requisition, it degenerates into mere "fuss and feathers."

SEEMING vs. REAL SUCCESS.

That success is often only failure in another form, may be observed in abundant instances by the thoughtful mind. That it need be so—that to perform one round of duties we must neglect another—is far from evident. But this opens a wide field of discussion, which we will not enter now. We will rather suggest one case, in the hope that the reader will be induced to examine his own heart, and search out his own real and seeming successes. It is never in vain for any soul, from the wisest to the weakest, to look within.

The feeling that we can do what our situation requires of us, and are doing it, is a pleasant lightener of our toil, while the sense of failure and unworthiness gives constant uneasiness of spirit. But many a one who works well and faithfully, and satisfies his associates or employers and the world, fails to satisfy himself. We have an inner, personal life, as well as a public and business one. In this we may fail—largely or wholly fail—and no seeming success in outward life can give contentment to the soul that is conscious of failure in working out its noblest aspirations.

Three forms of failure, we will instance, as those which may mar our peace, even when succeeding well in the eyes of the business world. We fail *intellectually* unless we are making constant improvement. We may have but little time for meditative study, and the intellectual exercise which business requires, often deals only with the surface of numberless things, so as to dissipate and distract, instead of disciplining, informing, and expanding the mind. Thus, though we may still aspire for higher wisdom, larger powers, and nobler attainments, the ability to mount up to them fails us for the want of encouragement and opportunity for exercise. The intellect is dwarfed or perverted, and we fall back forever from what we might have been with the earnest cultivation of our mental powers, carried up and on to the extent of our duty and true ability.

We fail *socially* when we allow ourselves no leisure for society—when we give all our thoughts to our employment—and hold only a business intercourse with our kind. Various causes may hinder men from companionship, and give good excuses for an isolated life, but they suffer therefrom nevertheless. How often the weight, not only of cares, but of *don't cares*, presses heavily, and they feel as if they cared for no one, and no one had an interest in their pursuits or happiness, and that the heart, like a house shut up, became more and more untenantable the longer it was closed and empty. A life like this makes one selfish, and hard and cold; it is no life for happiness or usefulness among men. And much greater our social failure, when, with a home and domestic ties, we fail to find the joys that they should bestow, because so absorbed in business pursuits that we have no time or thought for them. Man cannot live an isolated life without suffering a penalty therefor—he cannot neglect the claims of society without injury to his own social nature.

We fail *spiritually* when, though we keep up and cling to the form of religion, we do not enjoy its peace, or wield the moral power it bestows. Religion—that religion which purifies and saves the soul—is an ever-present and paramount influence which vivifies and ennobles every thought and action. This should ever be remembered, but we often forget it for thoughts of *self* and *now*—and that we do so, should at once humble and alarm us. How much more if thoughts of God and the future never stir the depths of the heart. Alas! how utter the failure of him whose success ends with this brief and uncertain life. Better fail for all worldly ends—better never to have lived—than to fail before God, when called to render account of our stewardship on earth.

—And now, is the *seeming* always and necessarily opposed to *real* success? We do not believe that it is—but have firm faith that one may be a successful business man, and fail not in due intellectual, social, and spiritual energy and advancement. One may very possibly, but still not easily, be a true man among men, and a whole man before God, as far as our nature is capable of such perfection, and thus glorify and bless the world with an example of TRUE SUCCESS.—B.

OLD LETTERS.

What a melancholy thing it is to look upon such records of joys forever gone! How much happiness we have lived out that can never be returned! How one and another has dropped from our side—friends, whom we remember enjoying life so freshly, going and coming, laughing, talking; doing all that we do now; seeming as if all that life and motion could not cease, but must go on so ever; and yet, how they are wiped out from the face of the earth! how men's tongues have forgotten to speak of them or their hearts to yearn for them; and how their places are not empty; but—with the exception of the few who have done some good work in the world—everything is, or at least seems, as if they had never been; for good or bad, much or little, every man, as he passed across the stage, has done his poor part, and helped to make up the world's history. And to think how we are hurrying off to the same blank! Blank for all we see, though not for all we hope and believe; blank to us that are here, though, we trust, not to those that are gone; literally hurrying ourselves, so out of breath with our haste that we cannot stop to think of where we are going, nor of what kind of existence awaits us there beyond; nor whether any awaits us; for I confess that the belief in a future life appears to me to sit very loosely on civilized mankind in general. A vast proportion of them, I hope, do believe in it, after a manner; but with how little real interest—how vaguely, coldly and incuriously! How few people one meets who are disposed to speculate gravely or seriously, discuss this subject of deepest importance, compared to which all the concerns of this life are mere childish joys!—*Mrs. Crowe.*

EXPECTED DECAY OF BOSTON.

In the Ladies' Magazine, published in London, March, 1784, under the head of "Home News" is the following:

"Two ships are arriving in the river from Boston, in New England, both in ballast, not having been able to procure cargoes of any kind, though they had (what was most desirable in that country) specie to pay for all they should have brought away: it appears from hence that the northern parts of the American States are in a much worse situation than provinces to the southward. Boston was once the most flourishing place in America, and employed near 500 sail of shipping, besides coasting and fishing vessels, which were numerous to a degree. Besides the trade, which subsisted within themselves, they were to America what Holland has been to Europe,—the carrier for all the other colonies. At present their distillery is entirely at a stand; their pottery and fur trade, once so considerable, is entirely over; their fishing is exceedingly trifling; instead of their vast exports of hemp, flax, tar, pitch, turpentine, staves, lumber and provisions, the only thing that was offered at Boston, when the above ships sailed, was train oil, which they got at high price."

Sunday Reading.

THE DEAD.

The dead alone are great!
While heavenly plants abide on earth,
The soil is one of deathless worth;
But when they die, a morning shower
Comes down, and makes their memories flower
With odors sweet, though late.

The dead alone are fair!
While they are with us, strange lines play
Before our eyes, and chase away
God's light; but let them pale and die,
And swell the stores of memory—
There is no envy there.

The dead alone are dear!
While they are here, long shadows fall
From our own forms, and darken all;
But when they leave us, all the shade
Is round our own sad footsteps made,
And they are bright and clear.

The dead alone are blest!
While they are here, clouds mar the day,
And bitter snow-falls nip their May;
But when the tempest time is done,
The light and heat of Heaven's own sun
Broods on their land of rest.

THE PURITAN SABBATH.

This commenced, in the old New England colonies, at sunset on Saturday; after which it was against the ecclesiastical and civil law of that time to perform any kind of labor until the Sabbath was over. Early on Sunday morning, it was the custom in some villages to blow a horn, by way of announcing the approach of the hour for public worship. In other places, a flag was hung out of the rude building devoted to that use. In Cambridge, Mass., a drum was beat, in military style. In Salem, a bell indicated to the populace of the settlement. The religious services usually commenced at 9 o'clock in the morning, and occupied from six to eight hours, divided by an intermission of one hour for dinner. The people collected quite punctually, as the law compelled their attendance, and there was a heavy fine for any one that rode too fast to meeting. The sexton called upon the minister and escorted him to church, in the same fashion that the sheriff now conducts the judge into the State courts of Massachusetts and some other States.

The minister was clothed with mysterious awe and great sanctity by the people, and so intense was this sentiment, that even the minister's family were regarded as something more than ordinary mortals. The Puritan meeting-house was an old structure. The first one erected by the colonists was built of logs, and had a cannon on the top. Those standing two centuries ago were built of bricks, with clay plastered over the coarse mud, covered with clay boards, now called clap-boards. The roof was thatched, as buildings are now seen in Canada East. Near the church edifice stood those ancient institutions—the stocks, the whipping post, and a large woolen cage to confine offenders against the laws. Upon the outside of the church, and fastened to the wall, were the heads of all the wolves killed during the season. In front of the church in many towns, an armed sentry stood, dressed in the habiliments of war. There were no pews in the church. The congregation had places assigned them upon the rude bench at the annual town meeting, according to their age and social position. "Seating the meeting-house," as it was called, was a delicate and difficult business, as pride, envy and jealousy were active passions in those days. A person was fined if he occupied a seat assigned to another. The elders occupied seats beneath the pulpit. The boys were ordered to sit upon the gallery stairs, and as "boys always will be boys," three constables were employed to keep them in order. Prominent before the assembly some wretched male or female offender sat, with a scarlet letter "A" or "D" on the breast, to denote some crime against the stern code.

The Boston Transcript, from which we have condensed this true account of the habits of the stern old Puritans, gives the following extracts from the laws at the time alluded to, regulating the observance of the Sabbath.—These are specimens of what are so often cited as the "old blue laws:"

The Sabbath day shall begin at sunset on Saturday.

No woman shall kiss her children on the Sabbath or fasting day.

No one shall run on the Sabbath day, or walk in his garden or elsewhere, except reverently to and from meeting.

No one to cross the river but with an authorized ferryman.

Things that are Coming.—Manhood will come, old age will come, and the dying bed will come, and the very last look you shall cast upon your acquaintances will come, and the time when you are stretched a lifeless corpse before the eyes of weeping relatives will come, and that hour when the company will assemble to carry you to the churchyard will come; and that moment when you are put in the grave will come, and the throwing in of the loose earth into the narrow house where you are laid, and the spreading of the green sod over it—all will come to every living creature who hears me, and in a few years the minister who now speaks, and the people who listen, will be carried to their long homes, and make room for another generation. Now all this you know, must and will happen—your common sense and common experience serve to convince you of it. Perhaps it may have been little thought of in the days of careless and thoughtless and thankless unconcern which you have spent hitherto; but I call on you to think of it now, lay it seriously to heart, and not longer to trifle and delay, when the high matters of death and judgment and eternity are thus set so evidently before you.

Time past is contracted into a point, and that the infancy of being. Time to come is seen expanding into eternal existence.

Miscellaneous.

(For Moore's Rural New-Yorker.]

TWO DAYS DAUGUERREOTYPED.

I.—A WINTER SCENE.

It is a winter-day and winter-like;
The brown earth and the dull drab stubble fields
To ashy grey the scant snow lightens up,
But pond and stream are robed in purest white
And every roof shares in the snowy dress.
The distant forests edge the horizon—
A darker border to the dark grey sky—
While stern and silent stand the scattered trees,
Not as in summer lull-o'life and joy,
(The life of verdure and the joy of song,)
But patient in their power to endure.

Few are the signs of life beheld to-day,
The roads are rough and biting is the air,
No one will travel who can stay at home,
The cattle almost shiver in their stalls,
Nor browse the sheep abroad as is their wont.
O, winter-like is this dull winter-day.

II.—A MORN IN SPRING.

It is an April morn—a sunny morn
After a night of showers. The first warm rain
Calls out the green and delicate new grass
Along the hill-sides, and the shrubs begin
To unfold their buds and show a tinge of green.
Many a plant sends up into the sun,
A tender shoot to try the air of Spring,
And soon the earliest blossoms will adorn
The peach and plum, and even now we find
The wood-sides rich with humble fragrant blooms,
Sweeter than any gorgeous flower of June.

—Day fadeth into eve. The wind has changed,
And cold rain is pouring fastly down,
Chilling the new spring grass, the half op'ed buds
And the more hardy flowers upon the hills.
Another change we'll hope the morn will bring,
For this is but a changeful April day.
—Another change! I'll sing of Spring no more,
The earth is white with drifts of thick spread snow.

The Maples, April, 1854. H.

LAGER BIER AND ——.

Lager Bier and—and what? That's the question. One says Lager Bier and *strength*. This is what makes me strong. With it, I can load the cart, handle the sledge, guide the plow, plant the corn, reap the grain, launch the ship, stem the current, fight the battles, and perform many other wonderful feats.

Lager Bier and *happiness*, says another.—With it, my mornings and my evenings are fraught with happiness. My mid-day toil is sweetened, and my midnight musings are delightful. Honor and fame would not add a whit to my enjoyment.

Lager Bier and *wealth*, says another. When I am supplied with this delicious beverage, I am rich. Not all the wealth of India could make me more so. Yea,

"I am monarch of all I survey,
My right there is none to dispute,
From the center all round to the sea,
I am lord of the fowl and the brute."

Lager Bier and—and—*everything*, says the fourth. When I am cold it warms me, and when I am hot it cools my brow. When I am sad it cheers me, and when sick it is my medicine. It is my food when hungry, and with it my thirst is quenched. It drives away care, and protects me from the pestilence. Without it, my existence would be shortened to utter insignificance, and even that rendered unendurable.

But there is another side to this picture.—The wife of him "who tarries at the cup," says Lager Bier and *wretchedness*. She looks upon the haggard and beastly countenance of him who to her is more than all others, and sighs for the husband of her earlier days. She hears his horrid and blasphemous oaths, and groans, in the agony of her soul, at the wreck of her hopes. His blows and abuses are borne with a fortitude more than human, and she still cherishes undying love for one who has forfeited the last claim upon her forbearance or favor. She looks upon the children of her bosom, and with faint hope of its realization, prays that *they* may be delivered from the perils of the poisonous bowl.

Lager Bier and *disgrace*, cries the forlorn daughter of the drunkard. When first I looked upon my father, I was happy. His smile cheered my childhood. His instruction and counsel guided my youth, but now—how changed! When I expect a smile, a frown or a blow is all I receive. When I ask for the means of comfort and improvement, he mutters language I dare not listen to, and bids me begone. I am shunned by the good and the wise, and consigned to that lower deep known as the sphere of the drunkard's daughter.—Would to God I never had been born!

Lager Bier and *rags*, says little Tommy, as he tries to collect the scattered fragments of his garments to protect him from the gaze of men and the blasts of winter.

Lager Bier and *ignorance*—and *poverty*—and *shame*, says the young man, as he tries to elevate himself from the slough of despair into which he has been consigned by the drunkenness of his father. I feel a crushing weight upon me, that prevents me from acquiring the dignity of respectable manhood. Oh! that there had never been such a thing as Lager Bier.

Lager Bier and *poison*, says the deluded youth. Lager Bier and the *gallows*, says the condemned criminal. Lager Bier and *death*, says the dying drunkard. Lager Bier and—and *eternal misery*, says the immortal part of him who returns to consciousness just as he enters the portals of the grave.

Young man!—old man!—everybody!—"Touch not the sparkling bowl. Touch not, taste not, handle not."

JULY — ITS DERIVATION.

July, now the seventh, was originally the fifth month of the year. From its numerical station, it was called by the Latins *Quintilis*. Mark Antony changed the name to *Julius*, the Gentile name of Caius Cæsar, who was born in this month. In the old Latin, or Alban calendar, it consisted of thirty-six days.—Romulus, who, in establishing his city, adopted, with modifications, whatever of the laws and usages of the neighboring people he thought expedient, reduced the number of days to thirty-one. The calendar was still further modified by Numa, his successor, who diminished the number to thirty. Thus arranged, it remained unaltered until the time of Julius Cæsar, who restored to the month the day of which Numa had deprived it.

The Anglo Saxons called it "maed-month," "mead month," from the meads being then in their bloom; also "aeftern-litha-monath," the "later mild month," in contradistinction to June, which they considered and named as the former mild month.

It is on the nineteenth of this month, that the Dog-days are supposed to begin. At this time, according to Hippocrates, a native of Cos, and a celebrated disciple of the *Æsculapian* art, and Pliny, the Roman Naturalist, "the sea boils, wine turns sour, dogs go mad, the bile is increased and irritated, and all animals decline and grow weak." A. J. E.

WOMEN OF CONSTANTINOPLE.

Bayley St. John, in his "Turks in Europe," gives the following account of the amusements of the women of Constantinople:

Nearly all Turkish women sally out every Friday, to take the air, away from the town, on the banks of the Bosphorus, or to some of the places where water and shade may be found. The wealthy go in carts without springs, of unwieldy and primitive construction—six or seven heaped together; and sometimes their husbands lead the oxen or horses to the chosen spot, and then go away, leaving the women perfectly free to enjoy themselves as they please. The most popular amusements are the singing and music of the gipsy women, who repair thither for the purpose—music which is amorously languid, and singing which is detestably indecent. A lunch is generally brought out, and when this is despatched, smoking and drinking commence—drinking not of sherbet, but of good brandy, or other strong liquors, which soon induce a boisterous gayety, so that the sultanas whom we often imagine as pining away imprisoned, may be seen rolling in convulsions of inextinguishable laughter on the turf, or huddled up in a still more advanced stage of intoxication, like bundles of rags. Their Montenegrin servants, who are the privileged beholders of such scenes, are often compelled to haul them into their carts, in which they are jolted back to the harem. Those who are not too far gone, frequently pull up in passing through the Christian quarter, at the doors of taverns to get more drink; and a file of a hundred carts may often be seen stopping in one street, all full of women, some made loud and chattering by their excess, others hanging sleepily about, and murmuring to be taken home.

There is a walk planted with elm trees, not far from the city, where only women are admitted. Two or three thousand assemble there at a time, and, sitting upon a verdant slope, enjoy the pantomime of a comedy, which some infamous Jews, hired for the purpose, perform on the limits of the forbidden ground for their amusement. On these occasions, it would scarcely be possible for a stranger to recognize Eastern life from the descriptions he is accustomed to read. The free comfort has more than once attracted the attention of the government, which not very long ago published an edict, complaining that they remained out late at night; that they rode forth in coaches with young Christian drivers; that they ventured into shops, especially those of apothecaries, and even pushed their audacity so far as to eat ices in the Frankish coffee houses of Galata and Pera. The edict accordingly recommended that early hours should be kept, and forbade women to enter shops of any kind, or to be driven about by young coachmen. These interferences with manners which were supposed to be great advantages in civilization, and which seem strangely accompanied by proclamations giving permission to women to appear on the public promenades, were of course ineffectual. The women continue their old customs, though some have been hanged or drowned for being found in the back shops of Christians.

It will require something else besides repressive measures to bring about a reform in this respect. All laws in the East, moreover, have the temporary character of proclamations. They are applied for a day and forgotten. It is forbidden, for example, most expressly, for shopmen to have any other than old men as servants; and they almost, without exception, have spruce, dashing young attendants.

To be happy, the passions must be cheerful and gay, not gloomy and melancholy. A propensity to hope and joy is real riches; one to fear and sorrow, real poverty.—*Hume.*

The object of life is life itself—if we do but our duty to our own minds, we shall soon come to do it to the world.

"DIED YESTERDAY."

Every day is written this little sentence: "Died yesterday, so and so." Every day a flower is plucked from some sunny home; a breach made in some happy circle; a jewel stolen from some treasury of love. Each day, from the Summer fields of Life, some harvester disappears—yea, every hour, some sentinel falls at his post, and is thrown from the ramparts of Time into the surging waters of Eternity.—Even as we write, the funeral of one who "died yesterday" winds like a winter-shadow along the street.

"Died yesterday." Who died? Perhaps it was a gentle babe, sinless as an angel, pure as the zephyr's hymn—one whose laugh was as the gush of summer rills loitering in a bower of roses—whose little life was a perpetual Litany, a May-time crowned with the passion flowers that never fade. Or, mayhap it was a youth, hopeful and generous—one whose path was hemmed with flowers, with not a serpent lurking underneath—one whose soul panted after communion with the great and good, and reached forth with earnest struggle for the guerdon in the distance. But that heart of his is still now, for he "died yesterday."

"Died yesterday." A young girl, pure as the orange flowers that clasped her forehead, was stricken down as she stood at the altar; and from the dim aisles of the temple, she was borne to the "garden of the slumberers." A tall, browned man, girt with the halo of victory, and at the day's close, under his own vine and fig tree, fell to dust even as the anthem trembled upon his lips; and he too, was laid "where the rude forefathers of the hamlet sleep." An aged patriarch, bowed with years and cares, even as he looked out upon the distant hills for the coming of the angel host, sank into a dreamless slumber; and on his door-post was next written, "died yesterday."

"Died Yesterday." Daily, men, women and children, are passing away, and hourly in some grave-yard the soil is flung upon the dead. As often in the morn we find some flower that blushed sweetly in the sunset has withered up forever, so daily, when we rise from the bivouac to stand against our posts, we miss some brother soldier, whose cheery cry in the sieges and struggles of the past, has been as fire from Heaven upon our hearts. Each day some pearl-drops from the jeweled thread of Friendship; some lyre to which we have been wont to listen, is hushed forever. But wise is he who mourns not the pearl and music lost, for life with him shall pass away gently as on Eastern shadow from the hills, and death be a triumph and a gain.

THE FALL OF AMBITION.

Mr. Patrick Adamson was once a preacher of highly distinguished popularity. Pride and ambition, however, appear to have influenced his sacred calling. By his influence and popular talents he rose rapidly in church preferment, until he obtained the mitre, and became Archbishop of St. Andrew's. Dazzled with the grandeur and dignity to which he had attained, and vain of the powers which his office combined, he commenced a violent persecution against his inferior brethren, at which he was frequently heard to say, that of whatever else he might be deprived, of three things he was certain—his riches, his learning, and the king's favor. But how vain was his boasting! A short time only elapsed before, in the face of all the people, the judgment of God overtook him, and his pride and cruelty became his ruin. His intellectual powers, of which he boasted, withered, so that, although his eloquence was greatly admired, he was unable to express himself, even in a few words, with coherency: his riches made unto themselves wings and flew away, until he was obliged to seek and subsist on charity from those very ministers he had persecuted; while the king's favor, in which he had trusted, not only was lost, but he became so far the object of his abhorrence, that the prelate himself declared "he was sure the king did care more for the worst of his dogs than for him;" and thus cast off by the world, whose favor he had sought, and by Him "whose favor is life," but whose favor he had rejected, he lived and died in the greatest misery and want.

O, how wretched
Is that poor man, that hangs on princes' favor!
And he, and every one, that God's best scale
And his soul's peace, barters for earthly trash.

A Clerical Pun.—One of the San Francisco Bishops, while delivering a discourse, let fall a very excellent pun, of which he was at the time perfectly unconscious, and which he did not discover until it was pointed out to him in his sermon, which was a written one.—He was speaking of Peter's denial of the Saviour, and of his subsequently going out to weep. "And why," said he, "did Peter weep? Because he had committed a *crying* sin.

Money, like beauty, is greatly disparaged, and eagerly sought, while poverty is highly praised and carefully avoided. It is like a case which often happens in society—that of eulogizing people whom we wouldn't associate with, and sneering at others whom we don't care to "cut."

Justice belongs to humanity.—The gods let all do as they may: their sun shines on the righteous and the wicked; man alone aims at worthiness and merit. No one ought to enjoy what is too good for him; he ought to make himself worthy of it, and rise to its level.

If you have great talents, industry will improve them; if moderate abilities, industry will supply their deficiencies. Nothing is denied to well directed labor; nothing is ever to be attained without it.—*Sir J. Reynolds.*

Adversity overcome, is the brightest glory, and willingly undergone, the greatest virtue.—Sufferings are but the trials of valiant spirits.

We are solemnly obliged to the children of those who have loved us.—*Achilles Poincelot.*

Ladies' Department.

CONDUCTED BY A——E.

TO HER I LOVE.

I know a little hand;
'Tis the softest in the land,
And I feel its pressure bland
While I sing:
Lily-white, and resting now
Like a rose-leaf on my brow,
As a dove might fan my brow
With its wing:
Well, I prize, all hands above,
This dear hand of her I love.

I know a little foot,
Very cunningly 'tis put
In a dainty little boot,
Where it hides:
Like a shuttle it ever flies
Back and forth before mine eyes,
Weaving music for mine eyes,
As it glides:
Well, I prize, all feet above,
This dear fool of her I love.

I know a little heart;
It is free from courtly art,
And I own it every part
For all time:
Ever it beats with music's tone,
Ever an echo of my woe,
Ever keeping with my own
Holy time.
Well, I prize, all hearts above,
This dear heart of her I love.

[Written for Moore's Rural New-Yorker.]

MELVA MAY.

A STRAY LEAF, BY CHARLEY FERN.

"Fall thickly on the rose-bush,
Oh, faintly falling snow!
For she has gone who trained its branches,
And wooed its buds to blow." *Glazier.*

Yes, gone! another victim for the grave's voiceless keeping—another spirit hushed and happy, lulled to rest upon the bosom of its God—another bright form of human beauty gone, leaving the thousand streams of our affection to flow back in an Alpine torrent upon our hearts. Yes, gone on a higher mission than that of earth—gone, to that Elysian abode, where care and sorrow are never known.—Sweet flowers may gather on the fragrant lilac spray, and blossoms fair bask in the sunshine on that rose-bush, but the soft, fair hand which trained their branches, but a little time ago, will train them no more. They have no more work to do. The quiet stars, as they hold their festivals around their midnight throne, will guard them after night-fall, and be their only protector. Melva May is no more. She has been gathered by the reaper to the harvest of the dead. We have clasped her hands meekly over her still heart, and borne her carefully to the forest grave-yard. She slumbers near where the streamlet murmurs by, and there the birds will sing all the year round, and the wild winds chant her requiem. A weeping willow throws its long, green branches over her, as nature weeps over the tomb of the brave, and gigantic maples of a century's growth stand like sentinels, to guard the treasured one. At early spring-time, bright, shining flowers will spring up around, while the white rose, and the myrtle, and the sweet forget-me-not, affection's fairest offering, will bloom above her head, and open their tender petals to drink the dews that gently fall o'er Melva's grave.

Yes, a beautiful girl, too fair for earth, has passed like a Peri from our midst. A being of angelic beauty, one whom angels envied, has gone to the land of the sleepers. Many a sojourner in the city of her earthly abode poured out their souls, gush after gush, as the "clods of the valley" rattled upon Melva's coffin lid. The very fountains of life seemed turned to tears and dust, and methought I could almost catch the notes of the welcome which greeted her in those realms where the rainbow never fades, and the sweet tones of her voice came stealing around me musical and gentle as the zephyrs that kiss the flowers in the summer morning hour, and I catch again the glow of that face radiant with immortal youth as she communes with pure and lofty intelligences.

When spring rides over the earth in his shining chariot, friends repair to her grave to plant a flower and shed a silent tear. And even in the mysterious silence of midnight, when the stars are spread out like the islands that slumber on the ocean, they pause upon the loved name of Melva. There is music in its utterance. It sounds like the moanings of sepulchral winds about the "marble mansions" of those we most believe.

Tread lightly o'er her grave; murmur low, ye winds, about that disconsolate home, for the fairest of their circle is journeying afar off.—All is lonely there now. As they gather around the once cheerful fireside, one vacant chair is found, one voice has ceased, forever ceased, and those eyes that once sparkled with joy and animation are closed, forever closed.—The going out of her life was calm as the falling of a quiet stream, gentle as the dews of heaven falling on the sylvan lake.

I watched the last faint smile of Melva, as she passed away, like a flower cut down in the morning, and they turned away alone and sorrowing, for it was a sad sight to see young and lovely woman fading away from earth, going down to the grave broken-hearted. Such was the sweet spirit of our dreams, Melva May.—Robed in spotless white, her singularly beautiful hair falling in fair, soft clusters low on her bosom, and her face radiant with heavenly smiles, she passed from earth to the skies.

Reader, have you ever ruthlessly planted a thorn in that heart stilled by death? or turned heedlessly away from that pleading voice? or caused a tear to tremble on those eyelids, motionless now? If so, *graver* memories will haunt you in many a silent and desolate hour. And if you ever visit this solemn, silent city of names, where we have left sweet Melva May,

Tread lightly as you approach near her tomb,
And sigh with the willow that o'er her weeps,
Touch not the spring beauties that around her bloom,
But leave them alone, where Melva sleeps.

Maple Grove, Marshall, N. Y., 1854.

MARRIED MEN.

So good was he that I now take the opportunity of making a confession which I have often had upon my lips, but have hesitated to make from the fear of drawing upon myself the hatred of every married woman. But now I will run the risk—so now for it—some time or other, people must unburden their hearts.—I confess, then, that I never find, and never have found a man more lovable, and more captivating, than when he is a married man.—A man is never so handsome, never so perfect, in my eyes, as when he is married, as when he is a husband, and the father of a family, supporting in his manly arms, wife and children, and the whole domestic circle, which, on his entrance into the married state, closes around him, and constitutes part of his home and world. He is not merely ennobled by his position, but he is actually *beautified* by it—then he appears to me as the crown of creation; and it is only such a man as this who is dangerous to me, and with whom I am inclined to fall in love. But then propriety forbids it. And Moses, and all European Legislators, declare it to be sinful, and all married women would consider it a sacred duty to stone me. Nevertheless, I cannot prevent the thing. It is so, and it cannot be otherwise; and my only hope of appeasing those who are excited against me, is in my future confession, that no love affects me so pleasantly; the contemplation of no happiness makes me so happy as that between married people! It is amazing to myself, because it seems to me that I, living unmarried, or mateless, have with that happiness little to do. But it is so,—always so.—*Miss Bremer.*

THE LOVE OF TRUTH.

If there is one thing more than another which we would teach a child, it would be a love of truth. All other things would be worthless without that crowning excellency in human character. Without it, the noblest structure is but a whited sepulchre. With all qualifications a man is to be shunned when deficient in this. The beholder may admire a fabric of general beauty and symmetry, but when the seam of falsehood is found running from cap-stone to base, he will shun the dangerous presence. There are few things more painful experienced in our intercourse with men, than to feel that they are unworthy of our confidence—that they are not what they seem—that they will betray while they smile—that we tread upon a crater's crest where all is hollow beneath.

Teach the child to tell the truth—to venerate and love it. Teach him so that whatever wrong he may commit, he will frankly and promptly admit it all. Reward the honest speech. Washington's father was never prouder of his boy than when he acknowledged his falsehood.

A true heart is not beneath every smiling face. A shark may play beneath the water's sunny surface.

A Great Man's Mother.—When Washington arrived at Fredericksburg, where his mother resided, on his return from Yorktown in October, 1781, the people came in crowds to greet him, but his mother, though proud of her son, was unmoved by the honors paid to him. When the triumphal procession entered the town, she was preparing yarn for the weaver of cloth for her servants, and was thus occupied when her honored son entered the house. "I am glad to see you, George; you have altered considerably," were her first words, and during the whole interview not a word was said by either of his glorious achievements. The next day she was visited by Lafayette, who spoke to her in glowing language of the greatness of her son. Her simple and memorable reply was, "I am not surprised, *for George was always a good boy.*"

Madame Roland, on the scaffold, asked for writing materials to note down the strange thoughts which were passing through her mind in her last moments. It is a pity the request was refused, for, at the end of life, a tranquil mind conceives thoughts, which before were inconceivable.

The setting of a great hope is like the setting of the sun. The brightness of our life is gone. Shadows of evening fall around us, and the world seems but a dull reflection—itself a broader shade. We look forward into the coming night. The soul withdraws into itself. The stars arise, and the night is holy.

The fireside is a seminary of infinite importance; it is important because it is universal, and because the education it bestows, being woven in with the woof of childhood, gives form and color to the whole texture of life.

Be slow to choose a friend, and slower to change him, courteous to all, scorn no man for his poverty, honor no man for his wealth.

A firm faith is the best divinity; a good life the best philosophy; a clear conscience the best law; and honesty the best policy.

MOORE'S RURAL NEW-YORKER

ROCHESTER, JULY 8, 1854.

To Agents and Others.

A new half volume of the RURAL commences this week—a favorable time to subscribe or form clubs for either six months or a year. Agents and other kind friends throughout the country are requested to give the matter such attention as may be consistent with their engagements. The RURAL will be furnished for six months, from July to January, at half the yearly rates, or as follows:—Three copies for $2,50; Six copies (and one free to agent) for $5; Ten copies (and one to agent) for $8,50; Twenty copies (and one to agent) for $12,50.

The Sixth Volume of THE WOOL GROWER AND STOCK REGISTER,—improved and enlarged to 32 pages monthly—also commences the 1st of July. We will furnish the two journals, *one year*, at the following low rates:—Three copies of W. G. & S. R. and one of RURAL for $3; Five copies W. G. and two of RURAL for $5; Nine copies W. G. and three of RURAL for $8; Twelve copies of W. G. and four of RURAL for $12. ☞ Specimen numbers, &c., of both journals sent free to all applicants.

Canal Enlargement.

CONSIDERABLE feeling prevails in the community, particularly in Western New York, in consequence of a proposition made to the Canal Board by Mr. CLARK, the State Engineer, to reduce the dimensions of the proposed enlargement west of Rochester. The lockage is downward all the way from Lake Erie to the Montezuma marshes, and the original plan was adopted with a view to furnish a supply of water from the lake sufficient to feed the canal all that distance. For this purpose it requires a dimension west of this city considerably above the average of 70 feet width by 7 feet depth; and such a plan was entered upon the record, and was considered a basis of operations for the Western Division. Mr. CLARK, in his own opinion, superior in wisdom to such predecessors as the distinguished engineer MCALPINE and others, alleges that the canal can be so fed on a smaller scale than the one heretofore adopted, and urges its change.

The deficiency of the old canal has been all along made up of the waters of the Genesee, to the immense detriment of the hydraulic power of this city; and for which unjust robbery, the State has thus far refused all compensation. An attempt was made, a few weeks since, to feed from the lake, and the consequence was, that all loaded boats were aground west of the city; so the Genesee is again laid under contribution. SAMUEL B. ROGERS, that distinguished advocate and friend of the canals, has been addressing the people in remonstrance against the proposed reduction. He spoke in this city last week Tuesday, on Wednesday in Albion, on Thursday in Lockport, and on Friday in Buffalo.

The original plan is the true one, and a change from it is not only an outrage upon this city, but it is impolitic, and unjust to the rest of the State; and it is hoped the Canal Board will take no backward steps in one of the greatest and most successful public improvements ever made in this or any other country.

The Genesee Valley Railroad.

THE wretched quarrels, misunderstandings and cross purposes of the directors, stockholders, friends and enemies of the above-named road, seem likely never to come to a termination; and the prospect is, that those persons who expected to see the road in operation a couple of years ago, will die of old age before the thunders of the iron horse will wake the echos of the valley. First, a survey was made with a view of connection with the Buffalo & N. Y. City road above Nunda; then a quarrel about a gauge; then a purchase of the city stock, and a partial payment of the purchase-money by the president of the road; then, after the expenditure of a large sum for grading, &c., south of Avon, an effort was made to stop the road at that place; then an injunction against the city directors, and a summons for them to show cause why they should not be superseded, since the city had sold out its interest in the road; then a rumor of a sale of the line to the Central, and an immediate completion on a narrow gauge; then a lease to the Buffalo, Corning & N. Y. road, on the most advantageous terms, to wit—the payment of 8 per cent. annually for its use, besides keeping in repairs; an issue of $300,000 of bonds to be made by the Valley road to complete the same; and lastly, an injunction against the issue of those bonds, and a wet blanket upon all its prospects.

When is this shuffling, vacillating policy to end? Is it to be when the road slumps through entirely, the sale of the city stock is canceled, and we are required as a municipal body corporate, to thrust our hands into the treasury, and extract therefrom an amount of funds to pay the city debt made in behalf of the road, that will make the tax-payers groan? The road will cost nearly twice as much as it ought to have done, in interest, depreciation of materials, &c., &c., and a consummation of the matter, either one way or the other, is devoutly to be wished. A railroad, or no railroad; that is the question.

☞ The Richmond Enquirer estimates the boot and shoe trade of Virginia at $2,000,000, (including $500,000 at Richmond,) of which not over $200,000 is manufactured in that State, the balance, amounting to $1,800,000, coming from the north.

Railway Casualties.

ON Tuesday, the 27th ult., a train of cars on the Great Western, C. W., Railroad ran off the track near Princeton, some 80 miles west of the Falls, by which accident two men were killed and several others badly injured. It seems some track repairers were putting in a cattle guard, and in doing so had removed several of the ties. From some cause the approaching train was not properly signalized, or the engineer failed to observe it, and as the locomotive dashed at full speed upon the unsupported rails, they bent under the weight, throwing the train off a high bank, and causing a perfect wreck of a portion of the cars. The wonder is that no more of the passengers were killed.

On the morning of the 28th ult., the lightning train going west on the Michigan Central Railroad, when about three miles from Wayne, ran into a carriage containing a farmer, his wife and child, killing them all instantly. The train was thrown off the track, and the locomotive and several cars broken. No one on the train was killed, but the engineer, fireman, and ten or twelve passengers were more or less injured.

Expulsion of a Senator.

A RUMOR comes from Washington that an effort is to be made to expel Senator SUMNER from that body, because of his anti-slavery feelings and tendencies. The southern men declare his sentiments to be treasonable and subversive of fundamental law; and Mr. SUMNER returned to his constituents, he will be sent back again with credentials so conclusive of their approbation, that even a mad Senate dare not refuse them. Mr. GIDDINGS, of Ohio, was sent home in this way from the House of Representatives, and immediately returned again to Washington by a special election, where he has been kept ever since, while those who voted his expulsion have gone to political perdition.

Postage North and South.

IT appears by a table carefully prepared by Mr. HAVEN, Congressman from Buffalo, and read by him in a speech against increasing the rates of postage, that thirteen of the slave States do not pay the cost of transportation of the mails within their borders, while only four free States fall behind, and three of these are the new States of Michigan, Illinois and California, which will in a few years pay back all the surplus expenditures made in their favor. Thirteen free States yield a postal surplus revenue of more than a million-and-a-half of dollars, while the thirteen slave States above stated fall short of their postal expenses above three-quarters of a million. New York gives $720,197 more than she takes, while chivalrous Virginia takes $129,762 more than she gives. Free Soil Massachusetts yields a net postal revenue of $323,849, while filibustering South Carolina goes to the treasury a beggar for $34,184.

PAPAL BULLS.—JOHN TIMON, Roman Catholic Bishop of Buffalo, has fulminated a bull of major excommunication against the trustees of St. Louis church, in that city, because they will not surrender the temporalities of that church into the hands of the said Right Reverend JOHN.

These trustees, by deciding to hold on to the real estate as intended by the donor, for the benefit of society, have thereby incurred the displeasure of the high church functionary, who represents the Pope, and have been by him rendered accursed for contumacy. The time has gone by when a bull ecclesiastical can knock down even kings and princes, like a row of ninepins. The aggregation of church property in the hands of the Bishops, is as anti-republican as it is dangerous to civil liberty, and the trustees evinced the right spirit in resisting such an outrage.

THE WEATHER is becoming unendurable in the city. The brick and stone walls and pavements indicating a "sissing" temperature. The occupants of stores, offices, and sanctums on our principal business streets, are suffering, like the banks, on account of a restricted "circulation." But while we of the city are thus "pent up," and nearly suffocated, our friends in the country are enjoying life amazingly, and their crops coming right along to maturity and a good market. The recent copious rains have been favorable to most crops, and they are consequently improving in appearance. We hear complaints of the ravages of the weevil in various directions, and fear the crop will be seriously injured by this insect in some localities.

MELANCHOLY ACCIDENT.—A little girl five years of age, on the morning of June 28th, fell over the precipice known as the "Devil's Hole," on the Niagara River, a few miles below the falls. She was playing near the bank, and losing her balance fell a distance of *one hundred and twenty feet*. When taken up she was insensible, although alive, but her recovery is doubtful. Falling such an immense distance, the force of her descent must have been broken, or she would have been dashed to pieces.

There is a bloody reminiscence connected with this spot, for it was here the French and Indians drove over the precipice a detachment of British and Colonial troops, during the time of the old French war.

Congressional.

THE session continues to drag its slow length along like a wounded snake; the principal items of interest transpiring in the Senate are the following:

Mr. Clayton, from committee on foreign relations, reported a bill having for its object the more effectual suppression of the slave trade in American vessels.

The bill making the port of Brownsville, Texas, one of entry, was taken up, read and passed.

The bill passed by the House providing for the granting of lands by the United States to Minnesota for railroad purposes, was taken up, read a third time and passed.

The Senate resumed the consideration of the Boston memorial for the repeal of the fugitive slave law, which was finally referred to a committee.

On motion of Senator Shields, the Senate went into Executive Session, and discussed the Mexican Treaty with closed doors.

A Committee of Conference was appointed on the disagreement of the two Houses upon the resolution for the final adjournment.

On Saturday Mr. Sumner, of Mass., presented another memorial for the repeal of the Fugitive Slave Law. He also gave notice to the Senate of his intention to shortly bring in a bill having the same object in view.

The bill allowing exchanges and granting additional lands for school purposes in the several land States, was passed.

HOUSE.—The House considered the Senate resolution for an adjournment. Mr. Orr, of S. C., moved to amend so as to adjourn sine die, on the 31st of July. Rejected, yeas 80, nays 81.—The vote was then taken on the Senate amendment for a recess from the 17th of July to the 16th of October, and this also was rejected, yeas 71, nays 103. The House thus adhered to its original resolution and appointed a conference committee.

The House was engaged most of the week discussing the appropriation bill, especially the appropriation of $10,000,000 to carry out the provisions of the Mexican treaty. The treaty was ratified on Saturday, July 1st.

Burning of a Ship at Sea.

THE British transport ship Europa having troops and stores on board for the army of the east, was burned on the Atlantic, 200 miles from the English coast, on the 31st of May. A portion of the crew and troops took to the boats and a number more clung to the wreck of the mainmast and spars that floated from the burning ship, and were picked up by passing vessels. One of the rescued officers writing of the catastrophe, says:

Of the number originally embarked on the Europa, twenty-one have doubtless perished; two officers (Lieut. Col. Moore and Veterinary Surgeon Kelly) are among the missing, and six non-commissioned officers, ten privates, two of the Ship's company, and one woman, have shared the same fate. The greater number of these were washed away from the wreck of the masts, to which they had clung, but Lieut. Col. Moore remained at his post to the last; and having repeatedly declined to leave the burning vessel until all his men had been safely removed, was at last driven into the mizzen channels by the flames, and there unfortunately perished.—From the concurrent testimony of those left on the burning wreck, from 10½ P. M. of the 31st ult. to 2½ A. M. of the 1st inst., it would appear that the conduct of the master (Mr. Gardner) was marked by great coolness and intrepidity throughout these trying hours; he was the last man to quit the wreck, and had his zealous endeavors to maintain order and save life been as ably seconded by his ship's company, there can be little doubt that the list of casualties would have been reduced.

Death of Madame Sontag.

THE queen of song, Madame SONTAG, Countess Rossi, died of cholera in the city of Mexico on the 17th ult., where she was engaged with an operatic corps. She was announced to appear on the evening of the 11th, in the opera of Lucretia Borgia, but being attacked with symptoms of the epidemic, the performance was deferred. She did not recover, however, and died, as above stated, in the fiftieth year of her age.

HENRIETTA SONTAG was a native of Coblentz, in the kingdom of Prussia, and was early distinguished for those remarkable musical talents which at later years placed her at the head of her profession. She was married to Count Rossi, a nobleman of Sardinia, and retired from the stage for some years; but her husband being reduced to poverty during the political revolutions of 1848, she once more engaged herself as an opera singer, in order to repair their shattered fortunes. She made a successful tour in Europe and this country, and left here for Havana and Mexico, at which latter place she was arrested in her career by the hand of death.

A FIENDISH OUTRAGE.—An infernal machine in the shape of a box containing a loaded bomb-shell, or some other explosive missile, was, on the evening of June 26th, sent into the Marine Hospital at Cincinnati, directed to the Steward, G. H. ALLISON. In the evening about 10 o'clock, the Steward and his wife being alone in the room, opened the box, when it exploded with terrific force, mangling the bodies of both in a horrible manner. Mrs. ALLISON had both her arms blown off and her skull fractured, while Mr. A. was dreadfully mangled. The furniture, windows, ceiling of the room, &c., were shattered to atoms. Both the wounded persons have since died. The police have discovered the place where the box was made, and it is believed a clue has been obtained which will lead to the detection of the fiend who perpetrated the deed.

News Paragraphs.

☞ The *State of Maine* newspaper says that the bills of the Banks of Canada now form no inconsiderable portion of the circulating medium in Maine. The bills of the Bank of Montreal and of the Bank of British North America, circulate in Portland as readily as the bills of the local banks. The Atlantic and St. Lawrence Railroad make Montreal and Portland near neighbors.

☞ The difficulties between the Superintendent and Engineers on the Erie Railroad have been settled, and the latter have returned to their work. A gentleman extensively connected with the road, states that the loss has been over $15,000 per day, besides the damage to be paid on freight—making a total loss to the company of over $100,000.

☞ The following Northern States will hold their annual elections at the days named:—Iowa, Aug. 7; Massachusetts, Nov. 13; California, Sept. 5; New York, Nov. 7; Vermont, Sept. 5; New Jersey, Nov. 7; Maine, Sept. 11; Illinois, Nov. 4; Pennsylvania, Oct. 10; Michigan, Nov. 7; Ohio, Oct. 10; Wisconsin, Nov. 7; Indiana, Oct. 10.

☞ Since the enactment of the Maine Law, a party of gentlemen in Nutrich have started a project to purchase Bradford's Island, which belongs to the State of New York, though situated within a stone's throw of the Connecticut shore, with the design of making it a sort of "striped pig" rendezvous for all that portion of the State.

☞ There were 231,791 soldiers engaged in the revolutionary war. Of this number, there are now less than fourteen hundred living, whose ages must average nearly ninety years. Seventy-three have died during the past year. A few years more, and these venerable octogenarians will only be known to the pages of history.

☞ The Constantinople correspondent of the Daily News says:—It is said that the commanders of the army have expressed their determination to have no reporters in the camp; that our generals are afraid of publicity, and resolved to tolerate no report of their doings, except such accounts as it may suit them to send home.

☞ The London Law Times laments the continued decline of the bar in London. It says that the business of the whole, if equally divided, would hardly pay for the rent of their chambers; and that many young men, intended for the bar, have wisely abandoned their intention, and gone into more hopeful pursuits.

☞ It is in contemplation to have a course of botanical lectures delivered at the Queen's garden at Kew, in the summer months, mainly intended for the scientific improvement of the gardeners, but of such a nature that the public may also avail themselves of this opportunity for instruction in botanical knowledge.

☞ J. P. Milliner, of our city, has purchased of the Bank of Auburn the Beach Mill property, so called, near the Aqueduct, for the sum of $30,000—one of the finest water-powers in the State—including the privilege of 36 runs of stones. There are in the mill ten runs, now in operation.

☞ A late number of the Daily Minnesotian notices a sale of land, about two miles from St. Paul, at two hundred and seventy-five dollars per acre, which one year ago could have been purchased at thirty dollars per acre. The man that bought it made a fool of himself, no doubt.

☞ The Wisconsin University, at Madison, Wis., is now in process of erection. It is to be built of stone. It stands on an eminence of 100 feet, a mile west of the Capitol, in a park of 55 acres. It was a fund of $100,000, and will soon be a prosperous and flourishing institution.

☞ The professorships of mathematics and astronomy, also of oratory and belles lettres, in the University of Georgia, are now vacant, and will be filled by the trustees of the institution at commencement, in the first week of August next. The salary of each will be $1,700.

☞ Hon. Samuel B. Ruggles, in his late speech in the City Hall, Rochester, on the subject of the canal enlargement, said the trade of the canal, in ten years, will amount to $1,215,000,000, or enough to buy the fee simple of New York, and have half a million balance.

☞ The Board of Underwriters of New York have resolved that insured vessels abandoned at sea must not be fired, as has been the practice. The ostensible reason for firing has been to prevent collision, but the underwriters suspect other motives are uppermost.

☞ The examination of the witnesses before the Grand Jury at New Orleans, in reference to the expected Cuban expedition, was unsatisfactory, they being excused from answering the principal questions on the slip-hafter plea, that they might criminate themselves.

☞ Gerrit Smith has resigned his seat in Congress. In a letter to his constituents, announcing his resignation, he says he will hold the place until the close of the present session, so that his successor need not be chosen until the general election in the fall.

☞ An English paper says that "Mr. Everett, farmer, of Kirby Lodge, near Rockingham, has a goose which he vouches to be at least ninety-three years old. It has been on his farm full fifty years, and passed the former part of his life on the farm adjoining.

☞ The June report of the Health Physicians of Buffalo shows that during that month there were 160 deaths, against 167 for May. Of these 8 were from cholera. Of these 8, only 2 were citizens. The others came to Buffalo with the disease upon them.

☞ It is stated by a correspondent that the coalitionists of the New Hampshire legislature are charged by the Democrats with bribery, in buying votes against their candidate for Senator, and also with having *drugged their liquor!*

☞ Thirteen pupils of the Indiana Deaf and Dumb Asylum, are the offsprings of cousins intermarrying. Thus it appears that idiocy is not the only fruit of this questionable practice of "keeping up the blood" of the family.

☞ One of the London correspondents of the New York Tribune writes that Prince Metternich says that "the present is not to be looked upon as a state of war, but merely of disorganized diplomacy."

☞ A splendid gold watch and chain have been presented by the citizens of Plymouth, Mass., to Joseph K. Hays, of Boston, the officer who resigned his post rather than execute the Fugitive Slave law.

☞ Over 2,000 lights of glass were broken at Smethport, Pa., on the 23d ult., in about five minutes, by a severe hail storm. Its track was half a mile wide, and all kinds of grain were cut down and ruined.

News Brevities.

—— The port of Erie, opposite Buffalo, has been declared a "warehousing port."

—— There are 1,675 churches in Massachusetts, 41 of which are Roman Catholic.

—— Over 3,000 patents were granted by the U. S. Patent Office during the past year.

—— Kossuth's sister died in New York, a few days since, of consumption. She was 36 years of age.

—— A new Post Office has been established at South Schodack, Rensselaer county, on the Boston Railroad.

—— Nearly one thousand operatives have been thrown out of employment by the fire at Worcester, Mass.

—— Late advices from Havana state that the yellow fever and cholera were prevailing in that city to a great extent.

—— Mr. Wise, the celebrated aeronaut, is expected to make a balloon ascension at Bridgeport on the glorious Fourth.

—— Gov. Seymour has appointed Hon. Gilbert Dean a Judge of the Supreme Court, in place of Judge Racelin, deceased.

—— A nephew of Omer Pacha, a lad about twelve or fourteen years of age, has just arrived in Paris for his education.

—— The cholera is reported very fatal at and near the city of Mexico. In one day there had been two hundred deaths.

—— There are 1700 ferrs in the Ohio Valley, and 500 acres in the Mississippi Valley, employed in the grape culture.

—— Mr. Edwin Goodell was ordained as a missionary to the Armenians in Turkey, at Rocky Hill, Ct., on the 12th ult.

—— The cholera lingers about Boston. The Times notices several cases, not, however, to create alarm among the prudent.

—— The cholera has appeared on several plantations in Florida and Louisiana. One planter lost 23 slaves by the disease.

—— The Great Western Railway Company are to pay $15,000 yearly rent for the use of the Niagara Falls Suspension Bridge.

—— A neat little church edifice was dedicated with appropriate services by the colored Baptist church at Alton, Ill., on the 28th ult.

—— Hon. Erastus Brooks, of the N. Y. Express, will deliver the address before the graduating class of the Normal School, the 13th inst.

—— It is stated that of eighty-four German papers which supported Gen. Pierce's election, only eleven remain friendly to his administration.

—— In the New York Marine Court Tuesday week, a verdict of $350 damage was rendered a young man for injuries sustained by the bite of a dog.

—— The Buffalo Commercial says an unknown man fell overboard from the International ferry boat, on Sunday evening, and was drowned.

—— Rev. F. W. Bogen, minister to the German emigrants in New York, estimates the total German population residing there at 80,000 or upwards.

—— A despatch from Hartford says an ice-house, containing two thousand tons of ice, was burned Monday night. About one-third of the ice was destroyed.

—— Locusts are infesting northern Illinois in myriads. In many parts of that region they cover every shrub, and make the woods vocal with their singing.

—— The Twelfth Anniversary Celebration of the Protestant Episcopal Sunday Schools of Baltimore, was holden, as usual, on Whitsunday afternoon, June 11th.

—— A resolve appropriating $3,000 for the erection of a monument to the memory of Gen. Putnam, has been introduced into the Legislature of Connecticut.

—— The Boston Grand Jury has refused to find bills against the Rev. Theodore Parker, Wendell Phillips, Dr. Howe and others, for aiding in the late slave riot.

—— The Lockport Courier is assured by farmers of Niagara county, that the weevil is making such havoc in the wheat, that the crops may be regarded as an entire failure.

—— It is estimated that the revenue of the United States, for the fiscal year terminating July 1st, will be $75,000,000; an increase of $14,000,000 in the present year.

—— It is stated that Prof. Henry will soon resign his position as the head of the Smithsonian Institute, Washington, and accept the Chemical Professorship in Princeton College.

—— In Ashfield, Conn., a son of Mr. Lolt Hall, aged two and a half years, while playing, fell into a barrel of swill, and before his condition was discovered, life was extinct.

—— Continued Indian depredations are reported from the Mexican frontier. The Mexican and American troops have succeeded in capturing some of the marauding parties.

—— Lola Montez, in attempting to jump her horse over a wide ditch, in search of flowers, near Grass Valley, California, was precipitated into a chasm, and narrowly escaped with her life.

—— A despatch was received by the government emigration officer at Toronto, a few days since, notifying him to prepare for the arrival of 500 female emigrants, now on their way from Quebec.

—— John Johnson has been imprisoned six weeks and fined fifty dollars, in Philadelphia, for selling lottery policies. A few years ago churches were built and colleges endowed by lottery.

—— Three cows and an ox, the property of Wm. Scoville, of Watertown, were killed by lightning on the 12th ult. One of the cows was valued at $175, and one of the oxen, with his mate, at $100.

—— The Mobile papers say that the Mobile and New Orleans Railroad is now in a fair way of being finished. It will form the last link, when done, in a chain of railways from Louisiana to New York.

—— The Bridgeport gasometer blew up the other day, during a thunder storm, while it was being examined by the Superintendent. Several persons were slightly injured. It is supposed that it was struck by lightning.

—— On Thursday last an extensive blast was made at Marble Hill, Ind., which had the effect to move 10,000 tons of marble. It was effected by three separate blasts, in making which one hundred and thirty lbs. of powder were used.

—— One of the weighty arguments used by British statesmen to reconcile the men of '76 to the tea tax, was dug up on Bunker Hill a day or two since. It was a cannon ball which is supposed to have weighed nine pounds originally.

Literary Notices.

THE WOOL GROWER AND STOCK REGISTER—The July number of this journal—the first of the Sixth Volume—appears in an entire new dress, with other essential improvements. The number comprises 32 large octavo pages, and embraces a variety of matter on Wool and Stock Husbandry, the Dairy, Poultry, &c.,—with careful Reviews of the Wool, Cattle, Produce and Provision Markets. It is also well illustrated. This is the only Stock Journal published, and is attaining a large and wide circulation. We happen to know that its receipts in subscription during the past three weeks have more than doubled those for the corresponding period of any previous year—a fact indicative of greatly increased popularity. We subjoin the table of Contents of the July number:

WOOL AND SHEEP HUSBANDRY.

New Volume, and its Improvements, ... 9
Sheep Feeding, ... 10
Sheep and Swine Feeding in Wis; Heavy Lambs, ... 11
Foul Rot among Sheep, ... 12
Statistics in Sheep, ... 13
French Merinos; Cotswold Sheep, ... 14
Characolese Sheep—"Fisher's Breed," 14
Enemy against—Good Management, ... 14
Wax and Wool, ... 15
Good Sheep—Shearing Machines; Docking Lambs, ... 16
Sheep—Increase, Profits, &c., ... 17
Wool Growing in Ohio, ... 17
Engravings of French Merino Sheep, ... 18
Review of the Wool Market for June, 1854, and for the Past Year, ... 19

THE STOCK REGISTER.

Retrospective and Prospective, ... 21
To Select Good Cows, ... 22
Fattening Hogs, ... 23
Mr. Bayley's Horse, "Othello," 24
Death of a Noted Morgan Horse, ... 24
Design of Farm Cottage in Rural Pointed Style, ... 25
Management of Horses, ... 26
To Treat Animals and Plants of Peruvia, ... 28
Remedy for Hoven, ... 29
Do Animals Consume Food in Proportion to Size, ... 29
Calves and Cows—Feeding, &c., ... 30
Stock in the Hopeful; Stock for Minnesota, ... 30
World's Fair at Cattle, ... 31
Cheese-Making, ... 31
A Few Words on Butter-Making, ... 31
Turkey in Amsden, ... 31
Purifying Poultry Houses, ... 31
For many Homœopathy; Remedy for Glanders, ... 32
Liniment for Horses; Hoven in Cattle, ... 32
Remedy for the Bite of a Mad Dog, ... 32
Tail Sickness; Cure for Scratches, ... 32
Mr. Bowen's Hereford Heifer, "Woodbine," 33
Cattle in New England; Kentucky Stock Sales, ... 33
To Prevent Hens from Eating their Eggs, ... 33

PEDIGREES OF THOROUGH-BRED ANIMALS.

Short-horn Bulls—Diamond, Second Diamond, Cupid, Derby, Norna Viva, Grand Duke, ... 34
Short-horn Cows—Rookie, Rifle IV, Ruby, Ruby II, Ruby III, Ruby IV, Ruby V, Ruby VI, ... 34

EDITOR'S MONTHLY MEMORANDA.

Coming; Annual Portraiture; Transportation of Beef Cattle; Siberian Sheep; A Monster Horse; Model Letter; Important Regulation; Great Horse Show, ... 35
Review of Cattle, Produce and Provision Markets, ... 36

ILLUSTRATIONS.

French Merino Sheep of J. J. McAllister, ... 18
Portrait of Mr. Bailey's Stallion, "Othello," 24
Elevation of Cottage in Rural Pointed Style, ... 25
Ground Plan of above, ... 26
Penn Je Wild Turkey, ... 31
Prize Hereford Heifer, "Woodbine," 33

For terms, &c., see advertisement in another column.

Foreign Intelligence.

Arrival of the Europa.

THE steamer Europa, with three days' later news from Europe, arrived at New York on the evening of the 30th ult.

The steamer Franklin arrived out on the 15th.

Silistria held out at our latest accounts, to the 14th of June. There was no truth in the statement that Hussa Pacha had been killed. From May 28 to May 30, six attempts to storm were made. All were repulsed with prodigious loss. During the nights of the 28th and 30th, the Turks made sorties and committed fearful carnage on the besiegers.

The Black Sea fleets are still engaged in conveying the Anglo-French force to Varna, but the matter seems to progress slowly.

ENGLAND.—Lord John Russel has been unanimously re-elected to his seat as member of Parliament for London.

The transport ship Europa was destroyed by accidental fire on the 31st May, in the Channel.

During the debate in Parliament recently, the subject of granting political freedom to Canada and the North American colonies, was brought up and strongly advocated by Lord Ellenborough and others.

FRANCE.—The Payse says that the question between France and the United States, arising out of the arrest of H. Dillon, the French Consul at San Francisco, is settled, nothing remaining for an arrangement, but the form of compensation to be given.

THE BALTIC.—A telegraphic despatch dated Hothland, Sunday 11th ult., says that both the French and English fleets were at Bordesund, 20 miles from Sweaborg, and it was expected they would attack the latter place on or soon after the 14th.

RUSSIA.—The Paris Monitour, under date of Athens, June 8th, states that the intelligence from the disturbed Provinces and from the Greek frontier, continued satisfactory. The defeat of Karaiscaki, the insurgent chief in Macedonia, has been confirmed.

Ill-feeling between Prussia and Russia has temporarily retired from the Ministry of Foreign Affairs, and his place, for the present at least, will be filled by Count Ellenborough, Buckle's retirement is on account of sickness and domestic affliction.

THE LATEST BY SUBMARINE TELEGRAPH.—The Austrian and Prussian joint note in reply to the Hamburg Coalition, was despatched to-day. On the 24th of May three English steamers destroyed the ships, dock-yard and stores at Brailowitch, in the north of the Gulf of Bothnia.—Three hundred and fifty thousand rubles of damage was done. On the 31st the steamers captured several off Uleaborg, and on the 1st of June the steamers destroyed the ships, dock-yard and stores at Whalborg, and 40,000 rubles damage was done. The loss of life by the burning of the transport Europa, was Col. Moore, Mr. Kelly, four sergeants, twelve privates, of the 11th regiment of dragoons, and one woman.

Prince Paskawitch was severely wounded by a Turkish bullet. He was removed to Jassy, and Gortschakoff has taken command.

From Sweden we are informed that every military and naval preparation is being made. A general opinion is expressed that a declaration of war by Sweden against Russia, may shortly be looked for.

LIVERPOOL MARKETS.—Flour advanced 1s.—Wheat 3d. Corn quiet at former prices. Lard dull at 1½. Tallow active. Cheese in request at full prices.

Kentucky Views of Homicide.

GEO. D. PRENTICE, of the *Louisville Journal*, in his controversy with the *Democrat* of that city, touching the murder of Professor BUTLER by MATT. WARD, says:

There have been scores of notorious cases of murder and acquittal in this city and this State, and, in not one of them, so far as we remember, did the editor of the *Democrat* denounce the perpetrator before trial, or the jury after it.—Purvis was the case of Kunz, who killed Schaefer. Kunz, hearing that Schaefer had spoken lightly of a member of his family, went to his coffee-house and cursed him. Schaefer picked up a small stick and went around the counter as if to strike Kunz, whereupon the latter thrust a deadly weapon into his breast and killed him. He was tried and discharged without punishment. There was the case of Delph, who killed his uncle, Reuben Lyter. Delph armed himself deliberately, and went to the upper market-house to meet Lyter. He met him, sought a quarrel with him, and shot him dead on the spot. The quarrel was about a prostitute.—Delph was tried and acquitted by a jury. There was the case of Croxton, who killed Hawthorn. Hawthorn was in a coffee-house, sitting in a chair, drunk and asleep. Croxton struck him on the head in this condition, with a brick-bat, and killed him. He was acquitted by a jury. There was the case of Peters, who killed Baker. In Natchez, a long time before, Baker, in a fight, had wounded Peters and made him a cripple.—Peters being thus disabled, Baker supported him. The latter, after about a year, became very poor and discontinued his bounty. Thereupon, Peters pursued him to this city, rode in the night on a hack to his house, sent the hackman to inform him that a gentleman and friend wished to see him on business, and, when Baker came out and stood at the window of the hack, shot him dead instantly. Peters was acquitted by the jury and lived here for some years afterwards—long enough, indeed, to murder or try to murder a prostitute upon whose bounty he subsisted. There was the case of Shelby, who killed Horine in Lexington. The two dined at the same public table, and, upon Horine's going into the street, Shelby demanded of him why he had looked at him in such a manner at the table. Horine answered that he was not aware of having looked at him in any unusual manner. Shelby said—"You did, and, if you ever do it again, I will blow your brains out. I don't know who you are." Horine responded—"I know you, and I suppose a man may *look* at you if your name *is* Shelby." At that, Shelby struck him with his fist, and, without any return of the blow, and without any display of a weapon by Horine, for he was unarmed, Shelby shot him dead. Shelby was indicted, but the jury found no verdict against him. There was the case of Harry Daniel, of Mount Sterling, who killed Clifton Thompson. Daniel and Thompson were lawyers, and brothers-in-law. Thompson made some imputation upon Daniel in open court. Daniel drew a pistol and shot him dead in the presence of judge and jury. Thompson had a pistol in his pocket, but did not draw it. Daniel was acquitted by a jury.

SINKING OF A STEAMBOAT.—Last Thursday afternoon, the steamer Buffalo sank at her dock in New York harbor. There were on board at the time some five hundred emigrants and their luggage, about to start for Albany and the West. When the boat was discovered sinking, all the passengers were got off, but their baggage went down with the boat, and will prove a great loss to the poor strangers in a strange land. It is not yet ascertained what caused the disaster, some stating that she was improperly laden, and careened so that the water ran into her ports, and others say she sprung a leak. It is most fortunate that she was not under way, as in that case the loss of life might have been lamentable.

AMERICAN EAGLE.—GEO. W. BROCKAW writes us from Lodi, N. Y., under date of June 21st, as follows:—"Seeing a notice in the RURAL that a large eagle was lately shot at Petersburg, Va., I thought it might not be uninteresting to your readers to learn that one was also shot and captured by me some nine weeks since. I wounded him in the breast and wing, and thus secured him; he has now entirely recovered from his wounds, has regained perfect use of his wings, and is growing quite tame. He measures *eight feet six inches* from tip to tip, being two feet more than the Virginia bird. He is quite an object of curiosity to visitors, and can be seen at any time by such as desire it."

Territorial Appointments.

THE *Washington Union* officially announces the following commissions by the Senate:

Gen. Butler, of Ky., Governor of Nebraska.

Thomas B. Cumming, of Iowa, Secretary of Nebraska.

F. Ferguson, of Michigan, Chief Justice of Nebraska.

B. R. Hardin, of Ga., J. Bradley, of Ind., Associate Justices of Nebraska.

E. Estabrook, of Wis., District Attorney; W. Izard, of Ark., Marshal.

A. H. Reeder, of Pa., Governor of Kansas; B. Woodson, of Va., Secretary; Hudson Brown, of Mo., Chief Justice; R. Ewan, of Ala., and S. W. Johnson, of Ohio, Associate Justices; A. J. Isaacs, of La., District Attorney; J. O. Donaldson, of Ill., Marshal.

THE POST OF SHELLS.—A 32lb. shell, fitted with fuses and all complete, costs 21s., and the charge of powder, with wads, 12s. more, or 33s. for every 32lb. shell fired. For an 8 inch, or 32lb. shell, the cost is 24s., and with powder and wads, 38s. The guns for the 32lb. shell weigh about two tons, and cost about £111.—The guns for the 68lb. shells weigh from three-and-a-quarter to four-and-three-fourths tons, and cost from £65 to £95 each.

☞ A railroad engineer last week saw a young bear in the woods near Delphos, Allen county, Ohio, and leaping from the locomotive as it was slowly under way, he caught and captured the young Bruin.

☞ The New York Police are benefited to wear a full uniform—blue coats, pantaloons and caps, with gilt buttons, and suitable devices to mark their rank and beat.

Commercial.

BUSINESS AND FINANCE.

The Cunard Steamer took out June 28th, $289,000 in specie, and the Union for Havre on the 1st inst., also exported in coin $113,226.

Two and a half million dollars have been transferred to the New York Sub-Treasury, from Philadelphia and Boston, to aid in paying off the 7,000,000 installment on the Mexican treaty.

The *Tribune* says, the total Imports at New York since January, are $87,340,000 against $53,655,000 same time last year. An unusually large proportion of the present imports are on consignment. The aggregate exports not including specie are $34,610,000 against $26,885,000 same time last year, showing an increase of over $7,000,000, and a decreased import of $5,000,000.

According to an estimate published in the N. Y. *Courier & Enquirer* the total U. S. receipts for the fiscal year ending July 1st, 1854, ... $74,793,284
Do. for the fiscal year 1855, ... 61,000,000

Increase of receipts for the present year, ... $13,793,284
The balance in the Treasury last year on the last of July, was, ... 21,342,892
It may be estimated at the same date this year at 32,000,000

Increase of means at the beginning of the next fiscal year, ... $10,657,108

The amount of public debt paid off will have been about $20,000,000. The outstanding debt is now $18,198,165, including $5,000,000 Texas indemnity not issued.

New York Central Railroad Stock has gone up again ready to pay, but many others are much depressed and a general want of confidence manifested. Michigan Central for instance, is 6 per cent. below par, with 6 months earnings accrued. This road pays regularly 8 per cent. annual dividends.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, July 5, 1854.

THE dust and smoke, and patriotism of the Fourth has not cleared away sufficiently to admit of a clear observation of the markets to-day; but prices cannot vary materially from those of last week. Wheat stands nominally at $2, but small quantities have been sold less. Other grains unchanged.

Wool does not come in freely; farmers taking the right view of things and reserving their crop. It cannot well be lower, and it is an article which does not deteriorate if properly stored.

Rochester Wholesale Prices.

FLOUR AND GRAIN.		FRUITS AND ROOTS.	
Flour, bbl.	$10,25	Apples, bush.	75@$1

NEW YORK MARKET—July 3.

FLOUR, &c.—Market a shade firmer. Sales 9,000 bbls @6,-06¾ for inferior State; $6,10@7,25 for common to straight do; $7,50@8 for choice do; $7,12½@8,12½ for mixed to fancy Western. Included in sales are common State, and Inferior, in the latter half of this month at $6,50.—Market for Canadian quiet—sales at $7,50@7,62½ common to choice brands. Jersey corn meal at $3,81½@3,87½.—Rye flour dull—sales at $5,44@5,50 for fine; $4,50@7 for superfine.

GRAIN—Wheat generally held higher, but we can hear of no important transactions. Rye quiet at $1,10@1,20.—New Southern is in market and held at $1,25.

Corn unsettled and lower. Sales at 80c for unsound to good Western mixed; 77@78c strictly prime West; 70 and yellow 80c. Oats more plenty and lower,—sales at 50@60c for State and Western.

PROVISIONS—The demand for Pork is quite light. A depressing effect is produced, and lower prices have again been accepted. Sales $12,75@13,37½ mess; $10,75 prime; closing at $10,50. Prime mess $14,25@14,50, and clear $16. Lard dull—sales at 9½@10c. Butter sells slowly at 14@ 17c Ohio; 17@19c State. Cheese dull at 6@9½c.

ALBANY MARKET—July 3.

FLOUR AND MEAL—Market for Western and State flour is unsettled with a downward tendency. $8,00@10 for low to fancy and extra Genesee. Corn Meal is rather easier; sales at $3,00 per 100 lbs.

GRAIN—In wheat nothing was done. Corn market opened dull and heavy; sales of Western mixed were made at the Boston depot at 73c round yellow, part damaged, at 70c, and Western mixed, afloat, at 74c. Rye is firmer; sales at $1,25. Oats, Western in a retail way at 52c weight.

BUFFALO MARKET—July 3.

THE market is quiet, holders of good grades firm, and a fair demand to all orders for the interior. Sales good to choice Genesee at $7,75@8, and Upper Lake at $7@7,25.

Wheat quiet, and very little inquiry—2,000 bush. white Ohio on private terms.

Corn in moderate demand, and offerings freely. Sales at 59@59c, and damaged at 51c. No sales of Oats.

Canal freights quiet at Saturday's rates—12½ on corn to New York, and 10½ to Albany and Troy.

NEW YORK CATTLE MARKET—June 26.

AT Washington Grove Yard—Offered during the week 3,282 Beef Cattle. Beef continues in large supply; there is a fair demand, but not brisk enough to clear the market. Prices are lower, the bulk of transactions to-day ranging from 8 to 9½c. per 100 lbs.—a decline of about 75c. per 100 lbs., as compared with last week's quotations. We quote Beef Cattle $7@7,50; Cows and Calves at $40@70; Veal Calves 6@7½c per cwt; Sheep $a6 6; Swine (corn fed) $7,75@8 per cwt. About 600 Beeves left over, market generally closing dull.

At Browning's—Prices at this market for Beeves have also declined, say about 50c. per 100 lbs. Sales at $8,50 @10,00 ₱ 100 lbs. for Beeves; Cows and Calves sold from $30 to $60. Veal sold at from 6½@7½c. per lb., live weight. Sheep range at from $3 to $6,50@7; Lambs at $2,-50@4,50. All sold.

At Chambers'—Market for Beeves very heavy, and prices lower. Prices of Beef ranged at from $8,00 to $10,00 per 100 lbs. Cows and Calves at from $30 to $ 0. Veal Calves 6@7c per lb. Sheep $5,00@6. Lambs $2,25@6.—All sold.

At O'Brien's—Market dull. Sales of Beeves at $8@10 per 100 lbs. Cows and Calves at from $39 to $45, as to quality—some few extra at $50.

ALBANY CATTLE MARKET—July 3.

AT W. Woolford's Bull's Head, Washington street,—Beef Cattle—600 at market. Prices—Extra $8,50; 1st quality $7,00@8, 2d do, $7,00; 3d, $6@6,50.

Cows and Calves—28 in market. Prices range from $39, $35, $40@60.

Sheep and Lambs—670 in market. Prices range at from $3 50 to $4 25.

Swine—Not any in market.

CAMBRIDGE CATTLE MARKET—June 28.

AT market 218 Beeves, 48 Stores. Market Beef—Extra, $8,75 per cwt; 1st quality, $8 25 8,50; 2d do, $7,75@8,00; 3d do, $7,50; ordinary, $7@7,50. Hides, ₱ cwt, $6,00@ 6,50. Tallow $8,00@8,25. Pelts, 60@75. Calf Skins, 15c ₱ lb. Veal Calves $5 to $8; ordinary $3@4 50.

STORES—Working Oxen—$182 to $15,25@185.

COWS AND CALVES—$21 to $34 @48. Two years old—None. Three years old—$31 to $36@38.

SHEEP AND LAMBS—2,000 in market. Prices—Extra—$5 to $7,00@7,50. By lot—$2,25 to $3,50@4,50.

SWINE—None.

BRIGHTON CATTLE MARKET—June 29.

AT market 700 Beef Cattle, 40 pairs Working Oxen, 90 Cows and Calves, 3 3-0 Sheep and Lambs, 1,000 Swine.

PRICES—Beef Cattle—Extra $8 75@9,00; first quality, $8 0 8,50; 2d, $7,25@7,75; 3d, $6,50@7.

Working Oxen—Sales from $90 to $160. Cows and Calves $23 to $70. Sheep—Small lots $7@7,00.

Swine—Fat hogs, sold at 6½ @6¾c. Shoats to peddle, selected, 5,6c, 1st retail from 6 to 7½c.

THE WOOL GROWER AND STOCK REGISTER,

VOL. VI.—ENLARGED AND IMPROVED!

THE WOOL GROWER AND STOCK REGISTER is the *only* American journal devoted to the important and profitable branches of *Wool and Stock Husbandry*. It contains a vast amount of *useful* and *reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union, the Canadas, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain PEDIGREES OF PURE-BRED Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Importers of Improved Stock throughout the country. It is published in the BEST STYLE, and ILLUSTRATED WITH MANY ENGRAVINGS—including Portraits of Domestic Animals, Designs of Farm Buildings, &c., &c. The careful REVIEWS OF THE WOOL AND CATTLE MARKETS, given in each number, are also worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year;

Five Copies for $2; Eight for $3—*in advance*. Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ NOW IS THE TIME TO SUBSCRIBE and form Clubs. Money, properly sealed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

FARM FOR SALE.

THE subscriber offers for sale the farm on which he now resides, situated in the town of Portage, Liv. Co., N. Y., containing 100 acres. The farm is about 4 miles from the village of Nunda, 3 miles from the famous Portage Bridge, and ¼ mile from Hunt's Hollow station, on the Buffalo and N. Y. City Railroad,—within 14 hours ride of New York city and 2 hours of Buffalo. The soil is of the *first* quality, well adapted to wheat or any crop usually raised in Western New York, and well watered. On the premises is a choice selection of fruit of the various kinds usually cultivated, in good bearing condition. The buildings are good and convenient. Any one wishing to engage in the Nursery business, would find it a very desirable location, as the soil is admirably adapted to the culture of fruit trees and every variety of fruit. It will be sold on most reasonable terms—most of the purchase money remaining 6 or 8 years if desired. G. WING.

Hunt's Hollow, Liv. Co., N. Y., July, 1854. 225-3t

THE GREAT RED DRAGON,

OR, THE MASTER KEY TO POPERY.

BY ANTHONY GAVIN,

CATHOLIC PRIEST, OF SARAGOSSA, SPAIN.

BOOK AGENTS WANTED,

TO SELL the work which is now ready, and just issued in detail and interest at any other work on the subject of Popery ever issued. The terrible revelations which it contains will startle every Protestant with horror, as coming from one who was a participator in the bloody deeds, and who has had the best opportunity ever possessed by any man to unveil the mysteries of the Great Babylon of Popery.

Finely Illustrated. Address immediately,

SAMUEL JONES, Publisher,
225-3t 86 Washington st., Boston, Mass.

CAVEATS.—Inventors and others desiring to apply for Caveats, are informed that all the necessary drawings and papers are prepared by the undersigned, with the utmost dispatch and on the most moderate terms. All other Patent business promptly attended to.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. ALFRED E. BEACH,

Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau st., New York. 225-3t

PATENT AGENCY.

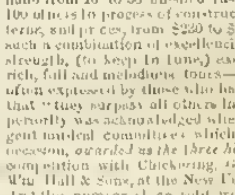
INVENTORS can have their drawings and papers prepared under their own inspection, by applying to

JOHN PHIN, C. & M. E. Agent for procuring and for the sale of Patents, 16 Buffalo St., Rochester, N. Y.

Particular attention paid to rejected applications, and to Chemical Patents.

He will also send the claim of any invention patented within the last 14 years, on receipt of one dollar. PATENT RIGHTS FOR SALE. 225-3t

STARR'S PREMIUM PIANO FORTES.



EVERY person in this vicinity, desirous to purchase a Piano Forte, will be *more than paid*, by visiting my rooms, where he can *buy directly from the manufacturer*, save the commissions of an agent, and select from the largest assortment in Western New York, as I have constantly on hand from 16 to 30 finished Instruments, and from 60 to 100 others in process of construction, of various sizes, patterns, and prices, from $220 to $700 each. They contain such a combination of excellencies, in their beauty, solidity, strength, (to keep in tune,) exquisite touch—soft, deep, rich, full and melodious tones—as all who see them, so often expressed by those who have bought, or used them, that "they surpass all others in the market." Their superiority was acknowledged when one of the most intelligent musical committees which ever acted on a similar occasion, *awarded us the three highest premiums*, when in competition with Chickering, Gilbert, Bacon & Raven, Wm Hall & Sons, at the New York State Fair for 1851,—and the number since sold, with their daily *increasing celebrity*, fully justifies the report of that committee. They are manufactured of the best materials, in the most perfect manner, with metallic plates upon the *Iron Overdal* scale, with the *Iron Bason Dampers*, and *French Grand Action*, *expressly for retailing*—(numerous applications at wholesale, is long constantly refused,) and can only be had at my rooms, where the instruments will be shown, and all orders promptly attended to. As it is fully settled that *a good Piano is cheap at almost any price*, and a poor one only a nuisance; and as I rely *wholly upon their merits* to secure them favor with the public, I invite for them, the most careful examination and scrutiny, to all who wish to buy at my warerooms and show rooms, Nos. 45, 47, 49 & 51 Orphican Buildings Main st., 2d Floor. Every instrument will have on it the name of the subscriber, and *be warranted to please the purchaser*.

Rochester, June, 1854. FREDERICK STARR.

VALUABLE FARM FOR SALE,

In the town of Penfield, Monroe Co., N. Y., containing 57½ acres, 50 of which are under improvement; with a good 2-*story* house and out-buildings, good fruit of all kinds, 8 acres of wheat, 8 acres of corn and potatoes, 12 acres of oats and 6 acres of grass on the premises. The farm is pleasantly located, on a good road, 10 miles east of Rochester, 100 rods north of Lovell's Corners, 3 miles from Fairport Depot, a pleasant village, and in sight of the school-house and brick church. Price, $3,000; one-third of the purchase money can lay on bond and mortgage for a term of years.

Also, a house and lot, with good fruit and well of water, at Lovell's Corners, for sale cheap. Inquire on the premises for further particulars, or address S. D. HALL,

Penfield, Monroe Co., N. Y., June, 1854. 224-6t

There are 5 sizes, at prices as follows: Number 1,...$16,50
No. 2,... 22,00
No. 3,... 28,00
No. 4,... 33,00
No. 5,... 39,50

Full and explicit directions accompanying each machine.

This valuable invention has already proved itself to be one of the most useful and important discoveries of the 19th Century.

The facilities of the United States, proprietors are so unlimited as to justify the expectation of constant and ample supplies, adequate to the rapidly increasing demand from all directions. Every dwelling house in the land—every store, warehouse and manufactory, should be furnished with a suitable supply of Annihilators without delay! They are cheap, durable and always ready for use—and so simple as to be available to all.

Pamphlets with ample testimonials, description, &c., furnished gratis. A. K. AMSDEN.

Rochester, June, 1854. 225-1t

FARM FOR SALE.

ABOUT engaging in other business, I will sell my farm at a bargain. It contains 83 acres of good land, well watered by durable springs—situated nearly 1½ miles from Macedon station, on N. Y. Central Railroad, and about 2 miles from Macedon locks. On the farm are suitable farm-buildings and a young orchard of excellent fruit. For further particulars inquire of S. L. SHOLFIELD,

223-4t* Macedon Centre, Wayne Co., N. Y.

FARMERS' AGENCY.

BEING a Practical Farmer, and having considerable experience in the selection and use of Farm Implements, and living in the vicinity of extensive Seed and Implement stores and Agricultural Implement Manufactories, and extensive Nurseries of the choicest fruit and ornamental trees and knowing the difficulties that farmers have to contend with in the selection of these in the busiest seasons of the year, I will select, purchase and carefully forward anything in the above line for a small compensation. Satisfactory reference given to all cases where required, and the money promptly returned in all cases where the wishes of the sender cannot be complied with.

232-1am-1t

Address I. A. CLARK, Marion, Wayne Co., N. Y.

IMPORTED HORSE "CONSTERNATION."

THIS well known thorough-bred horse, will stand the present season, as heretofore, at the farm of the subscriber, 1 mile west of Syracuse. For full pedigree see Derby & Miller's edition of DARTT.

TERMS—$10 the season, $15 to insure, *payable in advance in all cases*. Good pasturage furnished at fifty cents per week. Mares at the risk of owners in all respects. No more will be served that is either ring-boned, spavined, or blind. J. B. BURNET.

Syracuse, N. Y., May 1, 1854. 223-8tw-3tm

THE PEOPLE'S PATENT OFFICE.

THIS well known establishment is still carried on under the personal superintendance of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost facility and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examination.

Private consultations held daily with Inventors from 9 A. M. to 5 P. M. All communications and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid, ALFRED E. BEACH,

Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau-street, New York. 225-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture, Published Monthly.—Every number contains 32 pages, beautifully printed on fine paper, and *profusely illustrated with splendid engravings*, forming at the end of every year two fine volumes, comprising nearly 400 pages, with about six hundred elegant engravings. Terms, only ONE DOLLAR A YEAR, sent by mail. Specimen copies 12½ cts. Liberal terms above.

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

THE subscribers are now prepared to receive orders for pure Suffolk Pigs, bred from stock imported in 1849, by the late WM. STICKNEY, and by the subscribers, in January, 1854. Also an importation of 12 in October, 1853.

Address JOSIAH STICKNEY, Watertown,
or ISAAC STICKNEY, Boston, Mass.

Boston, March, 1854. 223-tf1w-2m

KETCHUM'S MOWING MACHINE.

THIS machine stands without a successful rival, as *the mowing machine of the age*. The supply will not be equal to the demand. If any person desires one for the coming season, they cannot avoid knowing it. The uniform price of which is $110 00. All who will forward us an order accompanied with the cash or satisfactory references, may depend upon being faithfully served with a machine in good season. H. C. WHITE & CO.,

Buffalo Ag. Warehouse and Seed Store, 151 & 153 West Seneca street, Buffalo, N. Y. 219tf

Poetical.

THE VOICE OF THE GRASS.

BY MRS. SARAH ROBERTS.

Here I come creeping, creeping everywhere;
By the dusty roadside,
On the sunny hill-side,
Close by the noisy brook,
In every shady nook,
I come creeping, creeping everywhere.

Here I come creeping, smiling everywhere;
All around the open door,
Where all the aged poor,
Here with the children play,
In the bright and merry May,
I come creeping, creeping everywhere.

Here I come creeping, creeping everywhere;
In the noisy city street,
My pleasant face you'll meet,
Cheering the sick at heart,
Telling his busy part,
Silently creeping, creeping everywhere.

Here I come creeping, creeping everywhere;
You cannot see me coming,
Nor hear my low sweet humming,
For in the starry night,
And the glad morning light,
I come quietly creeping everywhere.

Here I come creeping, creeping everywhere;
More welcome than the flowers,
In summer's pleasant hours;
The gentle cow is glad,
And the merry bird not sad
To see me creeping, creeping everywhere.

Here I come creeping, creeping everywhere;
When you're numbered with the dead
In your still and narrow bed,
In the happy spring I'll come,
And deck your silent home,
Creeping, silently creeping everywhere.

Here I come creeping everywhere;
My humble song of praise,
Most gratefully I raise
To Him at whose command
I beautify the land.
Creeping, silently creeping everywhere.

Rural Sketch Book.

TRUE COURAGE.

In the summer vacation of 1835, a party of gay young collegians visited Tattershall castle, in Lincolnshire. This remarkably noble ruin consists of a single lofty keep, rising to the height of two hundred feet, the interior being open from summit to basement. Mighty oaken beams once, however, spanned the mighty walls, supporting floors which formed stories of varying height. Many of these beams had fallen into the basement, completely rotten, through shameful exposure to the weather ever since the roof crumbled away; others still pertinaciously hung, more or less broken and decayed, but in a majority of instances, seemed as if a strong gust of eddying wind would send them down crashing, to mingle their fragments with those already below.

The party were in high spirits. They had drunk old wines, and their young blood flowed hotly in their veins; they had laughed, joked, and talked themselves into wild excitement.—About half way up the castle turrets there was a sort of open landing which goes along one wall of the structure; and on this landing the party stepped from the spiral staircase they had hitherto been ascending, and there paused a moment to look about them. The scene was striking. A few beams sprung across just below their feet; a few thick mooted rays of the sun pierced through the adjoining loop holes; a few fleecy cloudlets flitted athwart the blue light overhead. Startled by the noisy visitors, a number of dusky jackdaws flew out of their holes up and down the walls, and after chattering their decided disapprobation of being disturbed, made half a dozen whirling circles of the interior, then rose rapidly upward till they disappeared.

Immediately afterwards a great white owl projected his visage from a hole close above where one of the beams joined the opposite wall, and frightfully peering with its great dazzled eyes, the harmless creature, bewildered, popped from its hole on to the beam, and having made a few feeble flutterings with its wings, remained quite stationary, crouched in a ball-like figure, close to the wall.

"Oh, Deschamp," exclaimed one of the party, to a friend at his side, who was plucking the long gray moss of a peculiar species, which literally clothes the castle wall inside and out, "look yonder at Minerva's bird."

"Ha! ha!" chorused the company, "a veritable owl."

Thereupon one and all began picking up bits of brick and mortar, from where they stood, and threw them at the bird with various degrees of skill. One or two bits even struck it, but so far from being roused by them, the owl merely gave one hooting, long-drawn, sepulchral screech, and contracting its ghastly outlines into still smaller compass, fairly buried its broad visage between the meeting bony tips of its wings.

"What a stupid creature! hoo! horoo!" shouted they, thinking by that means to induce it to fly. But the outcry only terrified the bird to such a degree that it stuck its claws convulsively into the decayed timber.

"It's the way of them creatures," said the guide who was showing them over the castle, "they're about the stupidest things in creation, I'm thinkin'."

"Humph," muttered Lord Swindon, a handsome, athletic man of twenty, "with such an example before our eyes, we cannot but admit your opinion to be highly philosophic and undisputable. But I say, old fellow," added he, tapping the guide familiarly on the shoulder with the light riding switch he carried in his hand, "is *that* beam a rotten one?"

"I should'nt be over for'ard to trust myself on it, sir," answered the man—a fat, dumpy personage.

"You wouldn't! No. I should rather think not," responded Lord Swindon, a smile of supreme disdain sweeping across his features as he surveyed the "old fellow" from head to foot. "But tell me, did you ever know anybody to walk upon it, eh?"

"O dear, yes. Only last summer a young Oxonian ran from end to end of it, as I seed with my own eyes."

"Did he?"

"True," put in Deschamp. "I remember now it was young Manners, of Brazennose; and didn't he brag about it?"

"Him!" exclaimed Lord Swindon, with a toss of the head; "that fellow, poor milksop! Not," continued he hastily, "that it is anything of a feat. Phoo!"

"Not a feat?" murmured his companions; and with one accord they stretched forth their necks, and gazing down the dim abyss, shuddered at what they beheld. Well they might. The beam in question rose at the height of about one hundred feet, and naught beneath it was there but a gloomy chasm, only broken in one or two places by crumbling beams, and not even one of these was by many feet near it.—"Oh, Swindon, how can you say so?"

"I can say it, and I do," snappishly replied the young man, his brain heated with wines, "and at any rate, what that fellow Manners has done I can do; so look out!"

Thus speaking, he recklessly stepped upon the beam, and despite the remonstrance of his companions, was in the act of proceeding along it, when his arm was firmly grasped, and a low, deep toned voice exclaimed,

"My Lord, do you court a horrible death? do not thus risk your life for naught."

The individual who thus unhesitatingly interfered was evidently unknown to all present, being a casual visitor to the castle, who had just joined the group. With an imprecation, the madcap jerked his arm away, and sprang forward along the beam. Its surface was rough, roomled and uneven; and as he ran along, swerving from side to side, every instant in danger of being precipitated downward with the awful certainty of being dashed to pieces, his friends could hardly restrain themselves from crying out with terror, though such a course would probably have had the immediate effect of discomposing the equilibrium of their rash companion, and so induce the catastrophe they fully anticipated, without the power of prevention. Had the adventurer's presence of mind one moment failed—had his self-possession and confidence wavered or forsaken him—had his brain sickened or his eye turned dim for a single second—had he made the least false step—had his footing slipped on the slimy surface of the beam—had he tripped against any of the knots projecting from the rotten wood which had mouldered away around them—at once he would have been hurled into dread eternity.

But an unseen hand sustained him, and safely he reached the extremity of the beam, ruthlessly wrenched the trembling owl from his perch, waved it aloft in triumph, and then, with a proud ejaculation, began to retrace his steps with it shrieking and flattering in his hands. When he reached the centre of the frail beam, which creaked and bent terribly with his comparatively small weight, he paused, drew himself up to his full height—air above, air beneath, air all around, naught but air—and deliberately tore the head of the owl by main force from the body. Having perpetrated this cruel deed, he tossed the bloody head among the breathless spectators, and sharply dashed the writhing body into the void beneath his feet. He coolly watched its descent, until it lay a shapeless mass on the stones below; then, with a slow, bravoing mien, he walked back to the terrified party, and boastingly inquired of them whether Manning could beat that.

"My lord," solemnly said the stranger, "you have not performed the act of a brave, sane man, and you have committed a desperate deed, on one of God's helpless creatures. You ought to thank him, from the depth of your soul, my lord, that he saved you from the penalty you incurred."

"What do you say?" fiercely demanded Lord Swindon. "Do you dare to insinuate cowardice against me?" and with flushing brow he assumed a threatening attitude.

"I know not, my lord, whether you are brave or not; but what I have witnessed was certainly not an exercise of true courage," was the passionless reply.

"And yet I'll wager a cool thousand, that you dare not do it."

"True, I dare not do it; for I am incapable of offering such a deadly insult to my Maker."

"Fine words!" Then carried away by the excitement of the moment, he added, with an insolent look and gesture, "You are a lying coward!"

"Listen, my lord," answered the person thus addressed, and this time his tone was even calmer than before. "One year ago, you were walking at the midnight hour on the pier of the seaport of Hull, and but one other person was upon it, and he was a stranger to you.—You trod too near the edge of the pier, and fell into the sea. The tempest was howling, and the tide was high and running strongly, and ere you could utter more than one smothered cry, it had swept you many yards away, and you were sinking rapidly. Except God, none but the stranger heard your cry of agony; and as soon as it reached his ear, he looked forth upon the waters, and catching a glimpse of your struggling form, he instantly plunged in, and after much diving, eventually grasped you at a great depth. Long did he support your helpless body, and stoutly did he buffet the stifling waves, and loudly did he call for aid. At the last moment, you and he were saved, just in time for life to be preserved in both. Is not this true, my lord?"

"It is," emphatically responded the young nobleman, "but what have you to do with it? I don't know you, though it is not at all wonderful," added he, with a sneer, "that you should happen to know about the matter, for the newspapers blazoned it quite sufficiently."

"My lord, one question more. Did you ever learn who that stranger was, who, under God, saved your life?"

"No, when I recovered a little, he left me at the hotel, where he was unknown, and I have never seen him since."

"Then, my lord," was the startling rejoinder, "look well at me, for I am that stranger."

"You!"

"Yes—I whom you have branded as a liar and a coward. Little thought I that the life I saved at the imminent risk of my own, should be so madly, wickedly jeopardized, for no price whatever, as I have seen this hour."

So saying, the stranger bowed, and before another word could be uttered, he left the astonished party.

HOUSE SERVANTS ABUSED.

Nearly every family, of sufficient wealth, has its waiters, servants, help, male and female. And in nine cases out of ten, they are treated as inferior; and systematic efforts are made to make them feel their degradation, and keep them degraded. They do not participate in the social intercourse of the family, they do not eat at the same table, nor sit in the same room, nor engage in the same conversation.

They are never introduced to the visitors and friends of the family, nor allowed even to sit and listen to their elevated and instructive conversation. In a month's residence under the same roof, you would not learn that they had any names but Betty, Fanny, Ann, or John. They do not ride with the family to church, nor sit in the same seat with them.—No efforts are made to improve their manners, their intellects, or hearts. They are kept in the condition of slaves, as far as the law of the land will allow. Indeed, such is the miserable degradation to which they are subjected, that very few of our American girls submit to it. Many of them will almost starve, and when starvation threatens, will plunge into the lowest depths of vice and pollution for a living, rather than submit to the degradation of house servants in one-half the professedly Christian families in our cities. These statements will not be denied by those who know the facts.

We have a prominent church member, who not only refuses his servants a seat at the same table, but shuts them out from family worship! "For the oppression of the poor, for the sighing of the needy, now will I arise, saith the Lord, I will set him in safety from him that puffeth at him."—Ps. xii. 5.—*Golden Rule.*

How quickly nature falls to revolt, when gold becomes her object.—*Shakespeare.*

Youth's Corner.

ILLUSTRATED REBUS, NO. 29.

☞ Answer in two weeks.

(Written for Moore's Rural New-Yorker.)

MISCELLANEOUS ENIGMA.

I am composed of 23 letters.

My 2, 13, 6, 7 is a point of the compass.
My 3, 18, 9, 16, 23 is what every man wants.
My 4, 13, 7, 8, 14, 1 is under the doctor's care.
My 5, 11, 12, 18, 20, 5 is one of the grand divisions of the earth.
My 7, 18, 20, 6, 23 is the name of a person in Uncle Tom's Cabin.
My 9, 16, 4, 7, 11, 14, 5 is the name of a fire company.
My 10, 16, 12, 4, 5, 9, 7 is the name of a sea animal.
My 13, 12, 7, 8, 6, 1 is the title of a painter.
My 15, 23, 12, 11, 6 is the name of an ancient hero.
My 16, 19, 20, 2, 12, 12 is the title of Louis Napoleon.
My 17, 21, 9, 7 is a word often used by boys.
My 18, 1, 7, 18, 19, 21, 9 is a piece of furniture.
My 19, 13, 23 is the name of a month.
My 20, 16, 7 is a name applied to tame animals.
My 23, 13, 7, 16, 6 is the name of a county in this State.

My whole is the name of an incorporated company.

Answer to Agricultural Enigma in No. 26.—*Deep plowing and clean culture.*

Wit and Humor.

OFFICIAL.

In the following illustration of a printing office dialogue, there is decidedly more truth than poetry:

Foreman—You fellow with red hair, what are you at now?

Compositor—I'm setting "A house on fire!"—most done.

Foreman—What's Smith about?

Compositor—He's engaged on "A Horrible Murder."

Foreman—Finish it as quickly as possible and help Morse through with his "Telegraph." Bob what are you trying to get up?

Bob—A panic in the "Money Market."

Foreman—Jim, what are you distributing?

Jim—Prizes in "Perham's Gift Enterprise."

Foreman—Stop that, and take hold of this "run away horse." Slocum, what have you been about this last half hour?

Slocum—Justifying the "Compromise Measures," which my "sub" set.

Compositor—How about these "Municipal Candidates?"

Foreman—Run 'em in. What did you say, Slocum?

Slocum—Shall I "lead" these "Men of Boston?"

Foreman—No, they are "solid" of course.

Compositor—Do you want a full face head to "Jenny Lind's Family?"

Foreman—No, such things go in "small cups." Skeasicks, have you got up that "Capital Joke?"

Skeasicks—No sir, I'm "out of sorts."

Foreman—Well, throw in this "Million of California Gold," and when you get through with it, I'll give you some more. Wilson, have you finished the Coalition?

Wilson—Yes sir, the "Coalition is all up."

Editor—What do you want now?

Devil—More copy, sir.

Editor—Have you completed that "Eloquent Thanksgiving Discourse?"

Devil—Yes sir, and I've got up a "Warm Winter!"

Scissors—Here, take this "Official," and be off.

—[Exit Devil with a "phat take."

GRASS IN RUM.

An old fellow in Missouri, who was in the habit of "not belonging to the temperance society," was in the act of taking a nip one day before a young Virginian.

"What do you drink?" asked the latter.

"Brandy and water," was the reply.

"Why don't you drink mint juleps?"

"Mint juleps?" queried the old man, "why, what in the name of drinks is that?"

"A most delicious drink," was the answer, "and I'll show you how to make it, as I see you have mint growing almost at your door."

The young fellow soon produced the julep, and the old man was delighted with it.

About a month after, on his return home, the Virginian thought he would stop at his old friend's and "indulge," but judge of his surprise, when his inquiries at the door for his friend were answered by an aged female darkey, with,

"Oh, Massa's dead and gone dis two weeks!"

"Dead!" exclaimed the young man, "why, how strange! What did he die of?"

"Oh, I dno," returned the woman, "only a fellow come along about a month ago and larut him to drink *grass in de rum*, and it killed him in two weeks."

Patent Medicine Certificate.—Dear Doctor:—I will be 175 years old next October.—For 94 years I have been an invalid, unable to move except when stirred with a lever; but a year ago last Thursday I heard of the granicular syrup. I bought a bottle, smelt of the cork, and found myself a new man. I can now run twelve and a half miles an hour, and throw nineteen double somersets without stopping.

P. S.—A little of your Allcuredtoatum salve applied to a wooden leg, reduced compound fracture in nineteen minutes, and is now covering the limb with a fresh cuticle of white gum pine bark.

When a devout Mussulman found himself in the midst of a terrible tempest at sea, he recollected that he had violated Mohammedan law, by indulging in swine's flesh on a particular occasion. Having made due confession and prayed for a cessation of the storm, in vain, he pettishly exclaimed, "what a great fuss about a little bit of pork!"

Honest.—A toper after staggering over the bridge at Cambridge, Mass., offered the gatekeeper double toll, for he said he must have walked over every plank *twice*. A little of the same honesty would make the whisky seller return him the money he paid for the liquor he got drunk on.

It is said the editor of the Massachusetts *Life Boat* is delighted to learn that "the Czar refuses to treat." The next steamer he hopes will bring the news of his joining the temperance society.

One of Paddy's Best.—Whereas, Patrick O'Connor lately left his lodgings, this is to give notice, that if he does not return immediately, and pay for the same, he will be advertised.

A friend having one of Colts large-sized revolvers in his hand, was asked—

"Is that a *horse* pistol?"

"No," was his reply; "it's a *Colt's*."

The editor of the Albany Transcript says that the New York Day Book is set up entirely by girls, and adds that he should like to "set up with them." Probably!

Punch says Nicholas rules the *serfs*, but Britannia rules the waves.

GAFFNEY, BURKE & CO.,
IMPORTERS, WHOLESALE AND RETAIL DEALERS IN
Foreign and Domestic Dry Goods,
No. 53 Main Street, and Nos. 1 and 3 North St. Paul Street,
GAFFNEY'S BLOCK, ROCHESTER,

Have now in store one of the largest stocks of Dry Goods ever brought to this city, in which may be found every desirable article of Rolling and Domestic Dress Goods, adapted to the season. Their improved facilities for importing, and the great advantage of having a resident partner in New York, daily attending the Auction Sales, enable them to offer to Merchants and Dealers, by piece, case or bale, as cheap as can be purchased in the New York and Boston Markets.

WHOLESALE ROOMS NOS. 1 & 3 NORTH ST. PAUL ST.,
GAFFNEY'S BLOCK, ROCHESTER.

Summer Dress Goods.—We have just opened a very large stock of Summer Dress Goods, consisting of a fine assortment of Brilliants, plain and figured Barages and Tissues, plaid and striped Poupre Silks, Muslins, plaid and striped Lawns, Printed Jaconets, &c., &c. The styles are entirely new and beautiful.
GAFFNEY, BURKE & CO., 53 Main St., Rochester.

Broche and Crape Shawls.—We have now on hand a very large stock of Broche and Crape Shawls, all colors and qualities, which we are selling at very great bargains, as they were purchased much less than cost to import, at an Auction Sale.
GAFFNEY, BURKE & CO.,
Gaffney's Block, 53 Main St., Rochester.

More New Silks.—We have just received another large assortment of Summer Silks, from an Auction Sale, which were purchased CHEAP FOR CASH, and will be sold at less than cost to import. The styles are very handsome and entirely new. We have also just received 40 pieces of those celebrated BLACK SILKS, which we are selling as cheap as usual. GAFFNEY, BURKE, & CO.,
53 MAIN ST., GAFFNEY'S BLOCK, ROCHESTER.

SOMETHING VERY FINE!

The July number of Godey's Lady's Book is published, and contains as usual, a greater assortment of articles for ladies and only for show, but use, than can be found in any other periodical in the world.

The unrivalled Colored Fashions, to be found in no other publication. Front for a Lady's Cabinet.—Children's Dresses.—The Medora and Zulma Mantles.—Embroidery, with Cord.—Insertion for Shirt Fronts.—Embroidery, for Shirts.—Braid Patterns.—Godey's Course of Lessons in Drawing.—The Wild Flowers of the Month.—The Papyrus.—The Peignoir.—Bargains, Chemisettes and Under Sleeves.—Bonnet Preserver.—Initial Letters.—Chestnut Basket, for the Centre Table.—Coral Bordered Handkerchief.—Braid Pattern.—Head Dresses, &c.

A Splendid fine Engraving, NOAH AND THE DOVE—Gallantry—Music—A Day at a Ship-yard, with Engravings, Farm House, with Engravings, Life of Columbus, Godey's Invaluable and Seasonable Receipts.—Confectionary.—Ice Creams and Puddings.

☞ This No. will be sent on receipt of 25 cents.

TERMS.

Miller, Orton & Mulligan's Advertisement.
AUBURN AND BUFFALO, N. Y.

Announcement.—A Very Interesting Book Coming!
Will be Published immediately, DANIEL BOONE, and the HUNTERS OF KENTUCKY! By WILLIAM H. BONART, *Esq. In one elegant* 12mo. *volume, 350 pp. fully and richly Illustrated.*

"Interwoven with the History of the entrance of the Great West into the family of civilized nations, is the career of DANIEL BOONE. It has been the object of the compiler of this volume, to present the narrative of that career in fidelity, and in such light as would rescue the memory of this great man from the common judgment passed upon him, of being only an Indian fighter and a bold hunter.

To DANIEL BOONE, the Great Pioneer of the West—having ever a purpose and a destiny before him—this volume invites the reader."

All orders must be addressed to
MILLER, ORTON & MULLIGAN, Publishers,
Auburn or Buffalo, N. Y.

☞ Agents wanted to sell the above Book in the South and West. 233-2t

THE DATE LEAVES;
A Historical Game of Forfeits, by C. A. Bloss, Principal of Clover Street Seminary, Rochester, N. Y.; Author of Bloss' Ancient History; Heroines of the Crusades, &c.

Over Four Thousand Packs Sold in the First Ten Days.

The Date Leaves is an original system of Social Games, intended for Parlor Amusements, Educational Incentives, or regular School Instruction.

It is believed that they possess all the *social qualities* of Gaming Cards, without that tendency to dissipation which makes card-playing an dangerous to young people. They place the company in pleasant vein, face to face; they inspire mirth, and furnish subjects for conversation; and these subjects are such as excite inquiry and provoke research, and give systematic arrangement to the items of information which float uselessly in the memory.

No person can become acquainted with these Cards without gaining more historical information than he could by a year's reading, according to any method now before the public, and the *readiest* way to become acquainted with the Cards, is to play the games according to the directions which accompany the Cards. Price 50 cents. Published by WANZER, BEARDSLEY & CO., Rochester,
232-4t AUBURN, BEARDSLEY & CO., Auburn

WOOD AND COPPER PLATE ENGRAVING.
Miller & Mix, Designers and Engravers, No. 16, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of book illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed at short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. L. C. MIX.
232-tf JOHN MILLER.

LAND PLASTER
At Canandaigua, Victor, and Fisher's Railroad Depots. The subscriber has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.
217-4m. JIREH ROWLEY.

MOORE'S RURAL NEW-YORKER,
IS PUBLISHED EVERY SATURDAY,
BY D. D. T. MOORE, ROCHESTER, N. Y.

TERMS, IN ADVANCE:

Subscription—$2 a year—$1 for six months. To Clubs and Agents as follows:—Three Copies one year, for $5; Six Copies (and one to agent or getter up of club,) for $10; Ten Copies (and one to Agent,) for $15; Twenty Copies for $25, and any additional number, directed to individuals at the same rate. Six months subscriptions in proportion. As we are obliged to pre-pay the American postage on papers sent to the British Provinces, our Canadian agents and friends must add 25 cents per copy to the club rates of the Rural,—making the lowest price to Canadian subscribers $1,50 per year.

☞ Subscription money, properly enclosed, may be sent by mail at the risk of the Publisher.

*** The postage on the Rural is but 3½ cents per quarter, payable in advance, to any part of the State—and 6½ cents to any part of the United States,—except Monroe County, where it goes free.

Advertising.—Brief and appropriate advertisements will be inserted at $1,50 per square, (ten lines, or 100 words,) or 15 cents per line—*in advance*. The circulation of the Rural New-Yorker is several thousand greater than that of any other Agricultural or similar journal in America. Patent medicines, &c., will not be advertised in this paper on any terms.

☞ All communications, and business letters, should be addressed to D. D. T. Moore, Rochester, N. Y.

Progress and Improvement.

SUMMER FALLOWING.

The two principal objects of summer fallowing are, to clean the land, and to convert, by the admission of light and air, and by the comminution of the particles of the soil, its inert matter into available food for plants.—The action of light and air on the organic matter of the soil, and the effect of the gases, acids, &c., generated by its decomposition, upon the mineral or inorganic substances of the soil, form an instructive and interesting study; but we are not aware that a knowledge of them suggests any different process of tillage from that commonly adopted by intelligent practical farmers. In light sandy soils which admit the air readily,—and in which, consequently, there is but little inert matter capable of speedy decomposition by the admission of light and air,—summer fallowing is not followed by that increase of crops so observable on rich clay loams, which, without constant working, are impervious to the atmosphere. Farmers in old countries, taught by long experience, understand this better than the cultivators of the rich virgin lands of the New World. It generally happens that sandy land produces better crops for a few years, when first tilled, than clay land,—and a summer fallow on such land gives better results for a few years than on heavy loams; but after the organic matter of these soils is removed, as it soon will be under a system of summer fallow, the increase from this process is materially lessened. Summer fallowing on sandy soil, is simply accelerating the decomposition of organic matter and other elements of plants in the soil, rendering them available, without, in any way, increasing the quantity, and is, therefore, an exhausting system of culture. British farmers have discovered this to their sorrow, and the fact is gradually forcing itself on the public mind in this country; while summer fallow on heavy, dry land, is held in as high estimation as ever.

It will be readily perceived that the necessity of summer fallowing would render the farmer of heavy clays incapable of competing with the cultivator of light soils, were there not other circumstances which tend to equalize the cost of cultivation. Sandy soils are comparatively poor in organic matter, and other food of plants, while clay soils, as a general thing, contain an inexhaustible amount of all the elements of crops. Besides, the most expensive of all fertilizers, and the one most needed on all wheat farms, is ammonia; it exists in the atmosphere, and is brought down to the earth in every shower of rain. *Clay soils have the power of retaining this ammonia as the water filters through it*, but sand has not this power, or, at least, only in a very slight degree.—When a good underdrained clay soil is summer fallowed, the food of plants locked up in it are decomposed and rendered available while, at the same time, the ammonia of the rain is retained, and helps to increase its fertility; while a sandy soil, especially one which has been long under such a system of tillage, gains comparatively little from the decomposition and disintegration of inert matter, and retains but a small proportion of the ammonia, of the rain water; so that, while the heavy-land farmer is under the necessity of performing much more heavy work, and of raising fewer crops than his sandy-soil neighbor, yet he is not necessitated to use so much manure, and reaps frequently as much profit in one crop as the other does in two.

The summer fallow we are speaking of, is either that practiced in Great Britain—breaking up in the fall, and plowing, with harrowings and rollings, twice or thrice during the summer—or that adopted here, and which, for this climate, is undoubtedly the best, of plowing up early in the spring, and once in the summer, and again immediately before sowing. On sandy soils such a preparation for wheat is unwise, but on heavy clays we think experience and science show it to be the best system. But what shall we do with the sandy soils?—Sow them to clover, peas, beans, lentils, rape, &c., and either plow them in or feed them to cattle and sheep, and return back the manure; in this way the plants take up the ammonia of rain, and thus it is retained on a sandy soil just as it is by the action of the double silicate of alumina and soda in the clay soils. On medium soils, in which the clay and sand are in about equal proportion—such a soil as predominates in our own highly favored Western New York and Western Canada—a blending of the two methods of preparing the land for wheat, would appear judicious. This would be by growing as much clover as possible, eating a good portion of it on the land, and breaking up about the last week in June, simply cultivating to keep down weeds and render it mellow. This practice is becoming more common every year, and is found much cheaper and better than several plowings, as was formerly the custom. Even on heavy clay land, many of our best Western New York farmers—and there are no better on this or the other side of the Atlantic—prefer to plow under a good crop of clover when in bloom, simply cultivating the surface of the soil afterwards, as a preparation for wheat, to breaking up early in the spring and twice plowing before sowing. The clover keeps the land light, and the gasses generated during its decomposition serve not only to enrich but to ameliorate the soil. This is doubtless a good practice, but how far it is capable of superceding the summer fallow proper, in pulverizing clay soils, experience alone can decide. Our cold winters and hot summers, and above all the westerly dry winds which constantly prevail, and which so greatly astonish all Europeans in licking up moisture, render the pulverization of the soil in this country a comparatively easy task, and enable us to dispense with much of the labor necessary on a European, and especially on a British farm. Such are the differences of climate, that we are more and more satisfied that no European system of rotation or of tillage is applicable to this country, and that the only advantage to be derived from the experience of the "old country," is from studying the *principles* on which their systems are founded: and thus, while we may not be able to grow their turnips, rape, vetches, &c., and are not under the necessity of adopting their long or summer fallow, we may build up a system of agriculture adapted to our different circumstances, and having for its foundation the same great laws which govern the processes sanctioned by the experience of ages.

BREEDS OF CATTLE.

ADAPTATION OF DIFFERENT KINDS TO MILK, BEEF AND LABOR.

At one of the Agricultural Meetings held in Boston, last winter, the subject of the value of the various prominent breeds of cattle, as adapted to different purposes and parts of the country, was discussed in a very interesting manner. Sanford Howard, who has a very extensive knowledge of all stock matters, opened the discussion with a succinct history of the *Domestic Ox*, its origin, kindred species, different varieties, &c.; displaying a considerable research, and a full acquaintance with the subject. We have not seen the lecture in full, but gather our remarks from condensed reports of the same.

The Origin of the Domestic Ox is lost—it is found nowhere in an original wild state—the so-called wild stocks of several countries being only descendants of ancestors formerly domesticated. The Bison and the Musk Ox are distinct species, and are different from our native cattle, which must have originated on the Eastern Continent. There are many breeds or varieties of the Domestic Ox, some of which, being of untraceable antiquity, may be called original. Breeds may be classed as *natural* and *artificial;* the peculiar characteristics of the first are the result of natural causes, those of the last are the result of man's interference. Mr. H. instanced the Merino, and Scotch Black-faced sheep, the West Highland and Devon cattle as examples of *natural* breeds; the Leicester and improved Cotswold sheep, the Ayrshire, and Short-horn cattle, as examples of *artificial* breeds.

Breeds of cattle should be chosen according to the situation in which they are to be placed, and the purposes for which they are designed. Cattle are wanted for milk, beef, and labor.—These qualities are somewhat antagonistical, particularly fattening and milking. The *fattening* animal should possess, as much as possible, a rotundity of form, with a broad chest, and an even balance of the fore and hind quarters; whereas the *milker* should be characterized by flatness rather than roundness, and a considerable preponderance of weight in the hind quarters. The animal, too, which has the greatest tendency to fatness, has insufficient muscle and nervous energy for *labor*. Some farmers think a stock should be obtained which will combine all qualities, but this is unreasonable. No farmer expects to get his clothes, shoes, farming utensils, &c., all made by one individual; and on the same principle he should rear stock for particular uses.

Opinions as to the comparative merits of breeds for this section of country, (or this country indeed,) must be in a great degree conjectured, because no adequate experiments have been made in this matter. Different breeds are required for different localities, and we must be guided here, as well as in selections for different purposes, by what is known of their characteristics. On this basis, Mr. Howard submitted the following list as the best he could recommend:

"As Dairy Stock,

1. On poor and rough soils, the *Kerry* breed, indigenous to the mountains of Ireland, and combining remarkable hardiness of constitution with superior dairy qualities, especially for butter.

2. For better soils and milk-selling establishments, the *Ayrshires*.

3. For cities and towns, the *Jerseys*, at the same time testing them by fair trials as to general adaptation.

4. A selection from the *Native* or *common* stock, to be subjected to a systematic course of breeding.

5. Crosses of the *Ayrshire* and *Jersey* with the common stock, the offspring to be kept separate for a sufficient period to ascertain their qualities.

As Fattening Stock of Secondary Value for the Dairy.

1. For poor and rough soils and severe climate, the *West Highland Scots*.

2. For somewhat better soil, the *Galloways* and *Devons*.

3. For medium soils, *Herefords*.

4. For the best soils, and a milder climate, the fattening variety of *Short-horns*, tried also in comparison with *Herefords*.

For Laboring Cattle,

The *Herefords, West Highlands*, and *Devons*, are excellent draught cattle."

In our climate, owing to the extremes of heat and cold, strength of constitution is an important requisite in cattle that are obliged to undergo more or less exposure at all seasons, and this is one reason why Short-horns have so seldom succeeded in New England. The Western Highland breed is a very hardy one, and fattens as readily the third year, as any other variety. In England it is considered the model in the improvement of all other breeds as to form; and on account of these intrinsic properties Mr. H. advocated their introduction into this country.

"An important principle in reference to the improvement and profit of animals," Mr. H. remarked, "is *a proper supply of food*, and *proper shelter*. Until due attention is paid to this, it is of but little use to talk of breeds, for although there is a great difference in the natural propensities of animals of the same species, they may be *kept so badly that all are unprofitable*. Immense loss is annually suffered from insufficient feeding. Every living animal requires a certain amount of food to supply the waste of the system—to keep it in life and health. It is only when the supply is beyond what is necessary to support the waste, that the animal can retain anything in the shape of milk or flesh, or extra muscular exertion. Now if we have a given amount of hay and grain, it may be fed to so many animals—or the time of feeding may be so prolonged—that it will all be consumed in keeping up the daily waste which the vital organs occasion. Farmers frequently keep two cows on the food which barely keeps them alive, but which if given to one would be half returned in milk. A similar error is often committed in keeping a large animal instead of a small one. The pasturage may be such that a large animal has to graze constantly to obtain a scanty supply for its system, when a small animal, requiring proportionably less food, could lay by a surplus."

Mr. B. V. French, Mr. Lincoln, and other gentlemen, took part in the discussion, but the information presented by Mr. Howard we consider of the greatest importance to the general reader.—ED.

MR. BOWEN'S PRIZE HEREFORD HEIFER, "WOODBINE."

The accompanying figure is, we are assured, a good representation of "Woodbine," a Hereford heifer owned by H. Bowen, Jr., of Sennett, Cayuga County, N. Y. Woodbine won the first prize in her class at the N. Y. State Fair, September, 1853. She was bred by W. H. Sotham; calved Feb. 26, 1851; got by Tromp, dam [Ellen] by Trojan 2d; g. d. Rose, by Sir George (405)—gr. g. d. Perfection, by Major, a son of Noble (238.)

TEACHING BOYS TO MOW.

Eds. Rural:—It is very important that every farmer should be a good mower. Mowing is the most *pleasant*, joyful and delightful, yet *laborious employment*, that a farmer has to engage in. There is nothing in which a good farmer takes more satisfaction in doing, and doing well, than *mowing;* because it is literally "*reaping* his harvest." It is lamentable to see so many stout, able-bodied farmers who are poor mowers. Why is it so? Simply because they were not trained right the first summer that they commenced to mow. I know this to be the principal reason, from experience. The first summer that I commenced to mow, I was fifteen years old—old enough to have taken a narrow swath and kept up with the men, if I had been fitted with a good "rigging." Being a boy, and working one month for $7, my employer gave me an old worn-out scythe and snath, and told me 'to mow what I could, when there was nothing else to do.' My scythe was soft, consequently it cut well for a rod or two, before the keen edge was worn off. Being ambitious, and determined to try to 'keep up,' I soon lamed my side, which I am troubled with to this day when I mow. Two years after, I commenced mowing again. The man that I worked for, took it upon himself to whet and grind my scythe for me; and when I told him my scythe was dull," he would frequently tell me, in a harsh way, "*You* are dull, not the scythe." I would bite my lips, and mow on, when it seemed to me every time I swung my scythe, that it would rend my side.

The following *Theory* almost every man will instill into the mind of the new beginner, viz.: "Stand nearly erect; stand up to your grass, and let the heel of your scythe swing as close to the ground as possible. Don't carry your scythe too much. When you swing your scythe back, swing it no further back than even with your body. Mow your grass close. Point out well. Don't whet your scythe rounding, &c., &c."

The best way to learn a boy of a suitable age to become a good mower, is, 1st, Provide him with a light, stout snath, and one of the best of scythes. Let the snath be quite crooked near the heel. Let them be well hung, and put in good order. 2d, Teach him the theory of mowing. 3d, Let him whet and grind his own scythe generally; when he is discouraged or tired, whet it for him. 4th, When he grinds it, if he does not grind it enough, finish it for him. 5th, If your company numbers only two or three, let him take his turn and mow with the company. When he gets tired, either let him sit down, or engage in some other employment in the field until he is rested. If he complain that his scythe is dull, don't tell him that he is lazy; but say to him kindly that you will sharpen his scythe for him (i. e., if he feels discouraged, and thinks he can't sharpen it,) and mow a few clips on his swath with it.—When he mows *well*, praise him a little.—There are but very few boys but what are glad to be praised, if they think you mean what you say. Occasionally help him on his swath, if he lags. Don't require him to mow too long at a time. Require him to mow before sunrise, and allow him a nooning after dinner.

To the new beginner I would say, strive to put the theory in practice; imitate your seniors (if they are good mowers;) learn to strike quick, and mow with the heel, as well as the point of your scythe; don't mow when your scythe is dull; keep good courage, and you will become a good mower.

C. A. Hawley.

Skaneateles, N. Y., July, 1854.

Muck or Peat should be thrown up during the summer months to dry, and then, by composting it with fermenting manures, it is ultimately converted into an excellent fertilizer.—This is a better method than decomposing it with lime or ashes, as they have a tendency to liberate ammonia.

Communications.

IOWA.—AGRICULTURAL QUALITIES, &C.

Eds. Rural:—Having formerly been a resident of Western New York, and a patron of yours for some four years, I concluded that I might give some facts relative to Agriculture, &c., in Iowa, which would be interesting to many of your readers, and perhaps of material benefit to those who contemplate moving west. I do not expect that I am able to give instruction to those who are already rich in this world's comforts, neither do they need, nor would they heed if they did, from a poor man like me. But this is intended for those who are not well located east—and who do not wish to run in debt for a farm, thereby subjecting themselves to a slavish life all their days to secure a home they can call their own—which latter, in my estimation, is one of the essentials to a man's happiness.

I sold a small farm in Wyoming Co., N. Y., for $2,400, which, together with my stock and farming tools, amounted to something over $3,000, and thought that I could do better with my money (in these railroad times) in the vicinity of the Mississippi River. After a good examination of the country, I finally located in the western part of Jackson Co., Iowa, and have been here now about one year. I bought 400 acres of land—240 of prairie and 160 of timber with some improvements, for $1,400; paid $2,25 per acre to get 80 acres more of my prairie broke ready for a crop this last spring; paid $180 for a span of horses, $60 for a yoke of steers, and $25 per head for cows, and $1,50 for sheep. I fenced 160 acres of my prairie into four lots, which cost me about $100 to the mile, and built a small barn 26 by 36 with an underground stable, at a cost of $150. I mention this to give those who intend settling west, an idea of the necessary expense to commence farming here.

Now for the country. The eastern portion of Iowa is generally more rolling than most of the prairie States, consequently giving more current to the rivers and small streams which protect the numerous bodies of timber from the prairie fires. We have a body of timber here between the forks of the Maquoketa River 30 miles in length, and averaging 6 or 7 miles in width. This is one of the largest timbered tracts in the State; it contains eight different kinds of oak, black walnut, butternut, sycamore, cotton wood, linden, elm, hackberry and sugar maple, with some white and black ash. Evergreen trees of all kinds are scarce. I cannot analyze the soil and give you the name of its component parts, but I can tell you what it produces, which may be as well for your readers. Spring wheat, corn, oats, timothy grass and tobacco grow here in earnest. Potatoes, onions and melons do the best here of any place I ever saw.

Farming here is done in a careless manner at best, but there is more caution used to prevent too great a growth of straw than to encourage it. For the crops I have mentioned above, Old Genesee flats cannot compete with us. All the natural elements appear to be in the soil for growing winter wheat, yet it is not a sure crop, on account of our having but little snow—not enough to protect the roots in winter. The soil is deep and rests upon limestone for a foundation. The surface is generally free from stone of any kind, except some points where the underpinning shows itself in curious shapes. Money readily commands 15 or 20 per cent. interest, with good security. The climate somewhat resembles that of Oregon, being most of the time clear and dry, yet the heavy dews serve as a substitute for rains.—Railroads are pushing back from the Mississippi River at various points. We are on the line of the Iowa Central Air Line Railroad, running from Sabula, on the Mississippi, to Cedar Rapids. The job is let, and the contractors are just commencing operations.

It is estimated that 50,000 persons settled in this State last year, and the land throughout this country rises in value 100 per cent.

JOHN WATSON.

Maquoketa, Jackson Co., Iowa, July, 1854.

PROFIT OF KEEPING HENS.—In a late No. of the RURAL, I observed a short article on the profits of keeping fowls, in which the writer estimates the number of eggs per year from each hen at two hundred.

For eight years I kept a correct account of my poultry affairs. I sometimes kept as many as three hundred hens. My product of eggs varied from forty-nine to ninety-one for each hen during the year, taking one year with another. Hens well kept on corn and meal, and allowed full range one-half of each day, would average sixty eggs, and hatch a few chickens.

With corn at fifty cents per bushel, and eggs at twelve cents per dozen, I could clear from twenty-five to forty cents per year on each hen.

C. P. S.

BROOM CORN.—A ton of broom corn will make 1,200 or 1,300 brooms. It is worth $50 a ton, beside the seed. It is a great crop in the Mohawk Valley.

Agricultural Miscellany.

BUCKWHEAT AS A MANURE.

Is it profitable to turn in buckwheat, or green clover, as a manure? This is a question concerning which there is a difference of opinion. Some say that green crops, such as clover and buckwheat, if plowed in, will act as a profitable fertilizer—others say that they do not. A question like this need not be a matter of mere theoretical speculation or opinion, because it is susceptible of clear demonstration. We propose to give experimental facts in answer to the aforesaid question.

The crops most frequently employed for this purpose are clover and buckwheat. A practical farmer made the following experiments with buckwheat. He made his first experiment upon a field of clay-loam, which had been recently limed, and was by no means exhausted. The buckwheat was sown at the rate of 2½ bushels to the acre, as late as the 21st of July, and cut and plowed in on the 16th of September. Owing to dry weather, the wheat was not sown until the 2d of October. The crop was of excellent quality, and equally bulky in straw to the crop produced on similar soil where barn-yard manure had been used.

The second experiment was made upon a field of dry, gravelly loam—one-half under summer-fallow, manured with buckwheat, the other half, decidedly the better land, was planted to potatoes. The field contained 18 acres. The 9 acres planted to potatoes, were manured well before planting, and then after, before the wheat was sown. The other nine acres were sown with buckwheat, on the 4th of July. The quantity sown was twenty-three bushels. It was cut on the 27th of August. The crops produced on these fields were both good. The wheat raised on the ground produced by plowing in the green crop, weighed more per bushel, and exceeded in quantity 5½ bushels.

The third experiment was made in a field of eight acres—the soil being of a sandy nature, partly clay, and had not been limed for many years. The crop was fully equal in bulk and quality to that produced on ground prepared by other manures. The luxuriant growth of buckwheat induced the experimenter to ascertain the weight per acre of the buckwheat plowed in—which he found equal to more than twelve tons.

Another farmer says that he prepared a field for corn on this wise: one-half of it was sown to clover, and the next year, when in full bloom, it was plowed in. The following year, the whole field was planted to corn—the other half being well fitted with barn-yard manure. The corn planted on the clover ground, looked better when it first came up, and continued so through the season, the difference being so great that it was observed by passers by during the season. When harvested, the yield per acre was better where the clover was turned in than on the other half—though there was no perceptible difference in the soil—the difference in the crops being caused by the manures—thus demonstrating that the green crop was the better fertilizer.

The reason why clover and buckwheat are deemed preferable to the cereals, to plow in as a manure, is owing to the fact that they send their roots deep into the earth, and thus bring up the necessary mineral elements for the cereals.

We have thus given some facts in answer to the question with which we commenced. These statements introduce two considerations, both important. The first is that of summer-fallowing, concerning which there is a difference of opinion. The other is that of a rotation of crops, as above—silica plants alternating with lime plants.—*Amherst Express.*

REMARKS.—To our minds the above quoted experiments are far from conclusively proving the value of buckwheat when plowed in as a manure. In the first one, we do not know whether the farm-yard manure did any good or not, and therefore we cannot tell what increase is to be attributed to the buckwheat. As it was a clay soil, if the buckwheat *was* of any value, it might have been owing solely to its mechanical effects on the soil. In the second experiment, it would be reasonable to suppose that wheat, after a summer-fallow alone, would be better than after potatoes, which every farmer knows to be a very impoverishing crop. The third experiment is so vague as to be above criticism.

It is true that buckwheat is botanically not a cereal; but it is so allied to them in general characteristics and chemical composition, that in the question of rotation it has been usually considered as one. No satisfactory experiments have yet been made that at all show what are the manurial requirements of either Indian corn or buckwheat. Yet they are, in many respects, so similar to the wheat plant, that it will require very conclusive experiments to convince us that it is a good practice to grow either the one or the other simply to be plowed in as a manure for a wheat crop.—With clover the case is very different. Experiments and practical experience alike proclaim its value as a green crop for manure. We believe this is owing, not so much to its being a lime plant, or to its sending down roots into the earth and bringing up minerals for the wheat plant, as to the simple fact that it does not destroy ammonia during its growth, while wheat, and *probably* buckwheat, oats, barley, Indian corn, timothy, &c., do.—[Eds.

To cure the scratches on horses, wash the legs with warm strong soap suds, and then with beef brine. Two applications will cure the worst case.

WHEAT A PURIFIER OF THE ATMOSPHERE.

THE following extract from a paper on the "Comparative Fattening Properties of the various Breeds of Sheep," by JOHN B. LAWES, Esq., of Rothamsted, England, contains some new views on an important subject which will be read with interest:

"Experiments conducted upon this farm for the purpose of ascertaining how much nitrogen is converted into the flesh of the animal, prove that 100 lbs. increase live weight does not contain more than 2 to 3 lbs. The nitrogen, which is taken by the animal to make the increase, amounting from 15 up to 47 lbs., is converted, in its passage through the animal, into ammonia, every 14 lbs. forming 17 of ammonia, this ammonia being again employed in producing fresh vegetable matter; and here we obtain a glimpse of one of those beautiful laws by which the purity of the air is preserved.—It has been calculated that at the present time above 7,000,000 tons of oxygen gas are converted into carbonic acid gas daily by the population, the animals, and the various processes of combustion. As all these processes have been increasing daily since man was created, the atmosphere would become deteriorated, unless some compensation existed. Philosophers have shown us that it is the office of vegetation to restore the balance, that plants possess the wonderful property of separating carbon from its combination with oxygen gas, and restoring the latter in its pure state to the atmosphere, and they point to the great tracts of forest land in various parts of the world as the great sources of oxygen gas. To a thoughtful person it must, however, occur, that if the forests are the great sources from which oxygen gas is derived, two processes are going on at the same time, both of which tend to one result. The destruction of forests naturally and inevitably follows the increase of man and animals upon the earth; while, therefore, every day is adding to the amount of carbonic acid thrown into the atmosphere, the forests, which are supposed to be the great sources of oxygen gas, are becoming less and less in extent. The quantity of carbon fixed by vegetation on an acre of forest land has been ascertained by various chemists, and as they agree pretty well in the estimation, we may conclude that it will not be far from the truth to fix it at 1200 to 1500 lbs.

"The experiments upon the growth of wheat for eleven successive years, show that from 2400 to 3000 lbs. of carbon can be produced upon an acre by the supply of mineral salts and ammonia, substances which contain not a particle of carbon in their composition. However contradictory it may appear, at first sight, to suppose that the forest trees towering towards the sky, and exposing an immeasurable surface of leaves to catch every passing breath of air, should extract less carbon, and purify less air than the humble wheat plant, yet such is undoubtedly the case, and we must acknowledge the infinite wisdom of the Almighty, who in the cereal crops not only provides food for man, but that man must, in producing that food, at the same time purify the air which he is hourly deteriorating. In the United States the same natural laws must produce the same effects they have in Great Britain. Forests will disappear, and, as the population increases, land will become more valuable, and as a necessary sequence it will be better cultivated—instead of 14 or 16 bushels per acre, double that produce will be obtained, and consequently the plants on the same space of ground will purify a larger quantity of air. The greater portion of the carbon consumed by animals is either converted into carbonic acid by respiration, or into food for man, who also converts it into carbonic acid; the residue, consisting principally of salts of ammonia and mineral matter, are restored to the soil, and by their influence enable the plants to decompose fresh portions of carbonic acid."

COOL FARM-YARDS FOR SUMMER FEEDING.

J. J. MECHI, the celebrated "razor-strop farmer," of Tiptree Hall, Essex, England, who *soils* his cattle, and forces the manure in a liquid state, through iron pipes, by steam, all over the farm,—with whose doings, sayings, recommendations, successes and failures, our reader cannot but be well acquainted, (as he is better known and *esteemed* on this side of the Atlantic than in his own country)—thus writes to the *Gardeners' Chronicle*:

One of the greatest difficulties in feeding is the reconciliation of winter and summer—the Scylla and Charybdis of graziers. The roofs of my house and buildings look now as cold as winter, and as white as snow, having been limewashed by my farm laborers. The result is a pleasing and profitable temperature; for when the sun shines, every slate is cold, except those unlimed, which are scarcely cool enough to bear one's hand. The heat is reflected instead of absorbed, by the whitened surfaces.—The same principle is advantageously applicable to our towns, where the upper rooms and attics are insufferably hot during the summer months. This coolness causes a remarkable diminution of flies. Flies will not readily alight on the whitened walls and slating, and when they do, fall a more ready prey to the swallows. Rain will not wash off the lime, but the frosts of winter will remove it, and with it any vegetable matter that may have grown on tiles or slates, thus giving to old roofs a new appearance. The affair of cost is trifling—the comfort great; the same remark applies to stables. In South Wales, the roofs of houses, I am told, are all limewashed. A slight coat of white paint answers well. Of course, every one limewashes the inside of cattle sheds, cellars, stables, &c., once a year. This is my second year's experience in this matter.

MILLET.—Millet is an exceedingly wholesome and nutritious food for chickens, as it contains a high proportion of nitrogenous or flesh-forming food.

COARSE AND FINE WOOLED SHEEP.

THE following extract is from the address delivered before the Tompkins Co. Ag. Society, by the Hon. T. C. PETERS. Emanating from one of our best authorities on sheep and wool matters, it will be read with interest.

In sheep, there is more certainty as to which breed will be the most valuable in any given position. Being divided into two distinct classes, fine and coarse, it is not difficult to decide upon their merits. Coarse wooled sheep are more valuable for their mutton than for their wool, while the reverse holds true in regard to the fine wooled sheep. Therefore the farmer who can keep but a few sheep, say from twenty to fifty, or even one hundred, should by all means keep the large coarse wooled mutton sheep. With this breed of sheep, a farmer who can manage to have a few lambs early in January, and will provide warm shelter and good food will find that his lambs will bring him four and most likely six dollars, at six months old; paying him better for his care than any stock on the farm. Wethers of this breed when well fattened, will at three years old often bring as high a price as $18 per head in the New York markets. But when there is a wide range and a large flock, the fine wooled kinds are much to be preferred. There is one error into which many have fallen, on this subject, which should be pointed out; it is the idea of a breed of sheep which will combine the properties of a mutton with those of a fine wooled sheep. The attempt has been made in England, and failed, and will everywhere. A fine wooled sheep secretes a larger amount of oil in its fleece, while that of the mutton sheep is dry. The reason is obvious. In the coarse wooled sheep, the food producing oil is secreted in the fat, while the same food in the other is wasted in the wool.

STATE AND COUNTY FAIRS FOR 1854.

WE publish a list of the State and County Agricultural Fairs for the present year, so far as they have been announced. We shall be obliged to the Secretaries of our County Societies if they will send us information respecting their exhibition, &c.

THE POTATO DISEASE.—After a series of lengthened investigations upon this subject by several members of the British Meteorological Soc'y, the following conclusions were arrived at:

That the vital energy of the potato is unimpaired, and that it never becomes diseased until the stage of flowering, which is about one hundred days, or about three months, from the time of planting; that the causes are simultaneous in their action over a large tract of country, and at greater distances, and are peculiar to the soil and air. The conditions of the former are too rich and too much manure, too poor soils, and such as are moist and clayey; and of the latter barometrical and thermal states, and hygrometrical condition, with southern directions of the wind and atmospheric zone. That the object of the agriculturist ought to be the proper cultivation of the soil, and an endeavor to economize the vital power of the plant at the time of flowering; *and the removal of the flower before the formation of the seed would seem to contribute to this end.*

POTATOES FROM THE SOUTH.—The Norfolk (Va.) *Argus* states that the farmers and others in that city and vicinity are now doing a large business in potatoes. More than two thousand barrels are regularly sent by each steamer to New York. The average quantity sent per day to Baltimore, Philadelphia and New York, is about one thousand six hundred barrels.—The Baltimore boats cannot take on board near as many barrels as are sent to the depot. They sell readily at Norfolk at $4 per barrel, and command a handsome profit in the Northern markets. The Norfolk Beacon says that Mr. Dunden raised from twenty-five bushels of Irish potatoes, for which he gave $1,50 per bushel, a crop which sold for $806. After paying expenses, the net profit amounted to $698. The same paper states that on Thursday one farmer had sent $1,140 worth of cucumbers to Philadelphia and Baltimore.

THE Toronto *Daily Colonist* of the 5th inst. says:—"The cutting of hay is now going on throughout the country, and it is generally a good crop. The wheat crop also will be good. There seems to be an unusually large quantity of ground under preparation for Fall wheat this season, in the neighborhood of this city, and we are informed that it has seldom been in better order. The fruit crop will be unusually abundant."

CHEESE AS A DIGESTER.

AS a digester, as some not appropriately call it, cheese—that which is decayed and mouldy being preferred by connoisseurs—is often eaten after dinner. The action which experience seems to have proved it to possess, in aiding the digestion of what has previously been eaten, is both curious and interesting, and has had some light thrown upon it by recent chemical research. When the curd of milk is exposed to the air in a moist state, for a few days, at a moderate temperature, it begins gradually to decay, to emit a disagreeable odor, and to ferment. When in this state, it possesses the property, in certain circumstances, of inducing a species of chemical change and fermentation in other moist substances with which it is mixed, or is brought into contact. It acts after the same manner as sour leaven does when mixed with sweet dough.

Now, old and partially decayed cheese acts in a similar way when introduced into the stomach. It causes chemical changes gradually to commence, among the particles of the food which has previously been eaten, and thus facilitates the dissolution which necessarily precedes digestion. It is only some kinds of cheese, however, which will effect this purpose. Those are generally considered the best in which some kind of cheese mould has established itself. Hence the mere eating of a morsel of cheese after dinner does not necessarily promote digestion. If too new, or of improper quality, it will only add to the quantity of food with which the stomach is already overloaded, and will have to await its turn for digestion by the ordinary process.—*Chemistry of Common Life.*

HOEING CORN.

SOME ask how many times it is best to hoe corn and other crops. The best answer to that question was given us a few days since, by a farmer whom we had observed often at work in a field of corn in sight of our window. In going over the piece with him, and remarking the remarkable growth, we asked him how many times he usually hoed his corn. "Why," said he, "I do as I was brought up by my father to do. He never had any particular number of times, but hoed it all he could. I find it grows faster, and stands dry weather better, the oftener it is hoed." This is the true philosophy of culture; stir the ground. The direction for early and good crops, after the proper previous preparation, would be to stir the ground. Crops are like animals—they need petting and care. A friend was remarking to us, one evening, the difference in the growth of melon vines in a neighbor's garden and his own, side by side, of the same kind of soil and both rich, with the same kind of preparation for the seed, and the seed sown at the same time. The neighbor's melons were in blossom, while his own, he said, were but three or four inches in height. The difference has been produced by the constant labor and care of the gardener in stirring the ground and regulating the amount of sun and shade, air and moisture they receive.—*Hampshire Express.*

TO CURE SORE TEATS.—Take some linseed oil, after milking, and wet the teats for a few nights.

Inquiries and Answers.

ABOUT IOWA.—Having something of the western fever, and wishing to know more about the Western States, especially Iowa, with regard to agricultural interests, and knowing that some information might be obtained from an agricultural paper printed in that section, it would be quite a favor if you or some of your readers would inform me through the RURAL, of the name and place of the best agricultural paper printed in that State or vicinity. I should also be glad, for one, to hear through the RURAL from some of your readers who live in Iowa, or have been there, with regard to the most important interests of the State, such as Education, Agriculture, Manufactures, &c.—A SUBSCRIBER.

One of our Iowa subscribers has anticipated some of the above inquiries, by furnishing an article which we publish in another column.—As the information desired would interest many of our readers, we hope some Iowa friend will respond concerning other particulars.

THE IOWA FARMER AND HORTICULTURIST, edited by J. W. GRIMES and J. F. TALLANT, and published monthly at Burlington—$1 a year—is the paper our friend wants. It is a capital journal, ably edited and neatly printed, and ought to circulate largely at home and abroad. Agriculturists looking Iowaward, will do well to send for the *Farmer;* and certainly every Iowa farmer or horticulturist should give it his support.

LEGAL WEIGHT OF GRAIN IN NEW YORK.—Will you please give in the RURAL the Legal Weight of all kinds of Grain, in accordance with the Statutes of this State? There has been considerable dispute, at times, upon the subject,—some contending that oats weigh 32 lbs. per bushel, others 36 lbs., &c.—H. R. S. *Canada, N. Y.*

TURNING THE HORNS OF CATTLE.—I have a two-year old steer whose horns are inclined to turn downwards. Is there no method by which they can be made to turn upwards? If there is, will you, or some of your correspondents, tell me how it is done?—A YOUNG FARMER, *Canandaigua, N. Y., June 17, 1854.*

STUMP MACHINE.—Can you, or some of your correspondents, give a plan for a Stump Machine? The one given in the RURAL of Feb. 11 could not be used where the stumps were some distance apart.—C. O. S., *Mishawaka, Ind.*

Orchard and Garden.

MULCHING GOOSEBERRIES.

FRIEND MOORE:—I have seen several articles of late, in the RURAL and other papers, on the above topic, and, as my experience does not corroborate what is said about the necessity of mulching, I will tell your readers how I raise gooseberries.

The soil is a sandy loam, and was prepared by trenching and thorough manuring with well rotted barn-yard manure. The bushes are set on the *north side* of a common board fence, about three feet from it. Every autumn I place about a peck of compost, composed of barn-yard manure alone, around each bush, and in the spring spread it over the ground and spade it in, and keep the ground well hoed through the summer. I prune out the oldest wood every spring, (they are trained in the form of a bush with about six inches of clear trunk,) and pinch the straggling shoots during the season of growth. They have been set four years, and have borne enormous crops of very large sized berries every season, and entirely free from mildew. The varieties, Whitesmith and Crown Bob. Located as mine are, I consider mulching entirely useless, if they receive proper attention otherwise; but cultivated in the ordinary manner, mulching would, no doubt, be useful.—R. B. WARREN, *Alabama, July 3*, 1854.

A STRAWBERRY QUESTION.—I wish to make the inquiry through the RURAL in relation to the management of strawberries. I have two beds of fine plants, mulched with spent tan-bark, which were set the first of August last, in hills 18 inches one way and one foot the other. I wish to preserve them in the hills thus set. They have produced well considering the dry weather, and up to the present time, I have kept the runners cut off. I wish to inquire whether my plants will bear as well and as long by keeping the runners thus cut, as they will to let them run.

From the appearance of my plants, I think the first of August the best time to set plants. By so doing, and covering them immediately with tan-bark, they commence growing vigorously, and get a good root before winter; there did not one plant of mine freeze out the past winter, whilst almost everything else suffered much by the cold, freezing weather.—A. F. HOUPT, *Dryden, N. Y., July 2*, 1854.

STRAWBERRIES AND CHERRIES.—During the past three weeks we have been favored with abundant evidence of the adaptation of this region to the production and perfection of these choice fruits. Among other instances, the celebrated Nurserymen, Messrs. ELLWANGER & BARRY, demonstrated their enterprise and good culture—and a due appreciation of our *taste*—in furnishing us a liberal supply of certain choice varieties of the fruits named. Of Strawberries, the *Bicton Pine*, a very large, fine-flavored white berry, (of English origin,) and the *Genesee* and other seedlings, originated in their own grounds, were decidedly superior—an assertion which brother T. C. PETERS, (the "Member from Genesee,") who participated in the feast, will fully endorse. The Cherries—including the *Rockton Bigarreau, Knight's Early Black*, and *Elton*—were also voted very fine in quality. Thanks to Messrs. E. & B., and many other friends, who have kindly remembered us in similar manner.

PEACH BLOSSOMS.

IN trimming a row of peach trees yesterday (May 17,) set to answer the purposes of a hedge to shelter the north-west side of the garden, we found the limbs quite near the ground in full blossom, and one limb which had grown into the midst of a thick quince bush, was also in bloom, while every other branch on the tree had not only not blossomed, but was nearly dead. The branch in the quince bush was four feet from the ground. Several other branches were at about the same distance up, but unprotected, and the bark shriveled and tough, and had no signs of blossom or leaf.

Has any person ever attempted to protect branches of the peach tree by bringing them together in the autumn, and covering them with matting or protecting them in any way, other than by snow? The fruit is certainly worth a good deal of an effort to ensure its safety.—*N. E. Farmer.*

We have known numerous instances where protection of a similar character, evidently not increasing the temperature of the air in the slightest degree, has saved the buds of the peach. This protection has been always found more efficient when placed on the *south-east* side of the tree, which has led to the erroneous opinion that *east wind* produced the destruction of the buds. The true explanation is to be found in the influence of the *morning sun* on the frozen buds; a shelter from which will not unfrequently save the crop. Hence the efficiency of evergreen boughs; which are peculiarly efficient as a shade, at the same time that they possess none of the moisture-retaining qualities of a straw covering. Where evergreen trees are abundant, the peach crop might doubtless be often saved by a screen, covering the top of the tree.—*Country Gent.*

THE GUAVA.

(Psidium Cattleyanum.)

THIS graceful shrub is a native of the West Indies, and, where known, is esteemed as a beautiful ornamental window-plant. Its numerous pendant branches are thickly covered with firm, glossy, dark-green foliage, presenting at all times a handsome appearance, but one especially attractive when full of the fine deep claret-colored berries it bears. This fruit is something of the consistence and flavor of the strawberry, though the kind that grows best in common rooms is of small size. Other species, by a special course of hot-house treatment, may be made to bear abundant fruit,—the berries nearly as large as a hen's egg, but of coarser texture and less delicate flavor. As far south as Philadelphia, they have sometimes been kept over in a cold grapery, and have then borne abundantly in common rooms,—particular attention being given to watering the foliage, as well as the roots of the plant.

But the *Cattleyanum* will do well with the treatment usually given to house-plants. It is propagated by cuttings, by layers, or by ripe seeds planted before becoming dry. The pots should be filled with light, rich mould, and it is better to have them rather small—only removing to larger when they are full of roots—as the berries will be more abundant, and more likely to hang on until ripe. They are most fruitful when three or four years old, and ripen their berries better than when younger—but young and old require a temperature of not less than 60° to ripen them perfectly.—Growing plants require frequent watering, and we need not repeat that their glossy leaves should be kept free from dust to show their full beauty.—B.

FLOWERS AND PERFUMERY.

AN approximation to a correct idea of the importance of perfumery as an article of commerce may be formed, when it is stated that one of the large perfumers of Grasse, in France, employs annually 10,000 lbs. of orange blossoms, 60,000 lbs. of cassie flowers, 54,000 lbs. of violet flowers, 20,000 lbs. of tuberoses, 16,000 lbs. of lilac flowers, besides rosemary, mint, lavender, thyme, lemon, orange, and other odorous plants, in like the proportion. Flowers yield perfumes in all climates, but those growing in the warmer latitudes are, it seems, the most prolific in their odor, while those from the colder are sweetest. Though many of the finest perfumes come from the East Indies, Ceylon, Mexico and Peru, the south of Europe is the only real garden of utility to the perfumer. Grasse and Nice are the principal seats of the art. From their geographical position, the grower, within comparatively short distance, has at command that change of climate most applicable to bring to perfection the plants required for his trade. On the sea coast his cassie grows without fear of frost, one night of which would destroy all the plants for a season; while nearer the Alps, violets are found sweeter than if grown in the warmer situations where the orange tree and the mignonette bloom to perfection. England, however, can claim the superiority in the growth of lavender and peppermint; the essential oils extracted from these plants grown at Mitcham, in Surrey, realize eight times the price in the market of those produced in France or elsewhere, and are fully worth the difference for delicacy of odor.

CALIFORNIA SUGAR-PLANTS.—The alluvial lands of the Colorado are highly fertile—vegetation rapid—the products of the soil, which contain saccharine matter, are furnished in a greater proportion than is usually found in other places. From the bark of a small hard reed, the Indians procure sugar. Many varieties of bulbous roots contain a large proportion of sugar. Honey dews are frequent and abundant. I have seen willow groves cut down by the Indians, for the purpose of obtaining the boughs and leaves, which they wash in water, and then by boiling, or evaporating the water, procure a sweet and pleasant syrup. The mescal, "Agave Americana," for two or three months of the year, furnishes the natives with a sweet and nutritious food.—The Mesquite, a variety of the Melianthus, produces a bean in great abundance, from which they prepare a sweet and palatable flour. The pumpkins and melons grown upon the banks of the river are very superior, and marked for flavor and sweetness.—*Pacific.*

FRUIT IN THE NORTH-WEST.

THE Minnesota Pioneer contains a letter from G. C. Merrifield, a nurseryman at St. Paul's, on the inability of fruit trees to stand the winters in that north-western Territory.—He says, "I am satisfied that apples, pears, plums and the more hardy kinds of cherries may be grown successfully here without any protection; and that peaches, quinces, grapes, apricots, &c., may be cultivated with a little attention to their protection." The young apple trees, that suffered most from cold, were the Summer Queen, Ladies' Sweeting, Carolina June, and Summer Rose. Among cherries, the Elton and Black Tartarian were injured.—Quinces were also somewhat injured. The chief precaution requisite is to shelter the plants from the sunshine. It is not, perhaps, generally known, that in proceeding westward, one can go gradually northwards, and still retain the same moderation of climate; and that in the western part of Minnesota the great meteorological curve commences which carries a warm climate further to the north than has yet been explored. The agricultural capabilities of Pembina, on the Red River, in the Hudson Bay Territory, appear to be nearly the same as those of central Michigan. Probably, as Minnesota becomes better settled, fruit-growing will become more certain; but we recommend our friends there to grow seedlings, especially of peaches and quinces; and not to depend upon trees from southern latitudes.

DESTROYING MILDEW.—Marshall P. Wilder, in a communication to the Journal of Agriculture, speaking of mildew on grapes, greenhouse plants, and elsewhere, says:

"We have for more than fifteen years used sulphur for this purpose, and in no instance has it failed to effect a speedy cure. We have known instances where mildew, in the space of a few days, would spread its sporules over a large rose-house, destroying nearly all the foliage of the plants, but by the use of sulphur spread on the walks and over the plants, it was extirpated in a very short period."

THE GRAPERY.—Keep the soil light around the roots of grape vines. If the ground around them has been mulched previously, so much the better. If the bunches hang very thick, take out every other one. Pinch off the new shoots to prevent the formation of too much wood; it will improve the fruit. If the vines are infested with the aphis, dust gypsum or ashes over them, when the dew is on in the morning.—*Soil of the South.*

LEAVES OF GERANIUMS.—Galignani's Messenger says:—It is not generally known that the leaves of the geranium are an excellent application for cuts, where the skin is rubbed off, and other wounds of that kind. One or two leaves must be bruised and applied on linen to the part, and the wound will become cicatrized in a very short time.

LEVI PARKER, of Wilmington, states that pines and other evergreen trees pruned in the latter part of May or early in June will not bleed or be injured by the operation of pruning. He has tested them by many trials.

Domestic Economy.

MAKING BREAD.

THE Rhode Island Society for the Promotion of Industry gave the first premium on bread to Mrs. Hiram Hill, of Providence.—The following is Mrs. Hill's recipe for making the bread exhibited by her:

For two loaves of the ordinary size take two potatoes, pare them, slice them very thin, and boil quick, until quite soft, then mash to a fine pulp, and add little by little, two quarts of boiling water, stirring until a starch is formed; let this cool, and then add one-third of a cup of yeast. This forms the "sponge," which should remain in a moderately warm place for ten or twelve hours, or "over night," until it is light and frothy, even if a little sour it is of no consequence. When the "sponge" is ready, add flour, and work it in until you have formed a stiff, firm mass. The longer and more firmly this is kneaded, the better the bread.

Let the kneaded mass remain say from half to three-quarters of an hour to rise, then divide into pans, where it should remain say fifteen minutes, care being taken that it does not rise too much and crack, then put the loaves into a quick oven and bake, say three-quarters of an hour. If the oven is not hot enough the bread will rise and crack, if too hot the surface will harden too rapidly and confine the lour.—*Monmouth Farmer.*

HOW TO GET THE REAL FLAVOR OF COFFEE.—In Knighton's "Forest Life in Ceylon," are the following hints on the preparation of coffee, derived from long experience: The subtle aroma which resides in the essential oil of the coffee berry, is gradually dissipated after roasting, and of course still more after being ground. In order to enjoy the full flavor in perfection, the berry should pass at once from the roasting pan to the mill, and thence to the coffee-pot, and again, after having been made, should be mixed when almost at boiling heat, with the hot milk. It must be very hard coffee indeed, which, if these precautions be taken, will not afford an agreeable and exhilarating drink.

SODA DRINKING.—An immense quantity of soda water is required in cities, during the hot season, to meet the calls at almost every corner. It is possible, and we believe not very uncommon, to use it to excess, and produce difficulties not easily remedied. A few glasses a-day are about as much as the stomach can well bear; but when a goblet ful is swallowed every half hour, on a warm day, the habit becomes a vice, and the health must suffer. Too much of a good thing, whether of soda water or lobster salad, is worse than none at all.

Mechanic Arts, &c.

LIST OF PATENT CLAIMS

Issued from the United States Patent Office,

For the week ending July 4, 1854.

Galusha J. Bundy, Lyndon, Vt., for improvement in potato diggers.

Henry G. Bulkley, Kalamazoo, for improvement in the construction of salt evaporators.

Aury G. Coes, Worcester, for improvement in screw wrenches.

Thos. Cox, Lancaster, Pa., for improved machine for bending fellies.

A. S. T. Copeland, Pittsburg, for improved mechanism for operating saw-mill carriages.

Archibald H. Crosier, Oswego, for improved machine for creasing and leveling barrels.

Thos. W. Currier, Lawrence, Mass., for improvement in sofas, crib bedsteads, &c.

James A. Cutting, Boston, for improvement in preparation of collodion for photographic pictures.

Dexter Dennis, Barre, Mass., for improvement in finishing palm leaf hats. Ante-dated January 4, 1854.

C. H. Eisenbrandt, Baltimore, for improved valve for wind musical instruments.

William Finkle, Cole Creek, Ind., for millstone dress.

Robert B. Forbes, Boston, for improvement in lightning rods for vessels.

Joseph Frey and D. B. Burnham, Battle Creek, Mich., for submarine battery.

Heman Gardiner, New York, for improvement in quartz crushers.

Thomas Green, Philadelphia, for improvement in steam boilers.

Joel Gleason, Geneva, for improvement in milk strainers.

John R. Hague, Pittsburg, for improvement in machinery for punching fire holes in hose.

Wm. C. Hibbard, Boston, for improvement for regulating the motion of steam boilers.

Enoch Hiddon, New-York, for improvement in reading and writing stands.

Fenton Humphrey, Boonton, N. J., for improvement in spike machines.

Samuel Ide, East Shelby, N. Y., for improvement in seed planters.

Joshua K. Ingalls, Williamsburg, N. Y., for improved catch for vault covers.

Philip H. Keck, Morgantown, Va., for improvement in wash-boards.

Jas. F. Laird, Philadelphia, for improvement in ore stamping machines.

Jos. Leeds, Philadelphia, for improvement in controlling draft in brick and lime kilns.

Wm. Henry Muntz, Norton, Mass., for improvement in paddle-wheels.

John A. Pitts, Buffalo, for improvement in horse-powers.

Ben. Severson, Philadelphia, for improvement in cast-iron car-wheels.

John S. Speights, Baltimore, for improvement in brick-kilns.

M. J. Wheeler, G. W. Rogers, H. W. Pierce, and M. B. Tidey, Dundee, N. Y., for improved leveling plane.

Jerome B. Young, Harper's Ferry, for improved mode in hanging bells.

Wm. H. Poindexter, Fayette County, Tenn., administrator *de bonis non* of John R. Remington, deceased, late of Macon County, Ala., for improvement in cement compounds.

Henry Burt, Newark, N. J., assignor to the Newark Patent Hosiery Company, of the same place, for improvement in knitting machines.

Thos. Drayton, Brooklyn, assignor to G. W. McCready, Jr., of New York, for improvement in purifying oils.

Wm. Butterfield, Boston, assignor to himself and Edgar M. Stevens, of same place, for improvement in sewing machines.

Solomon W. Ruggles, Fitchburg, Mass., assignor to himself, Artemas H. Smith, and Jos. O. Austin, of same place, for improvement in self-acting cheese-presses.

Jno. Taggart, of Roxbury, assignor to himself and Richard Pitts, of Dorchester, Mass., for improved machine for excavating earth.

RE-ISSUES.

John J. Greenough, New York, for improvement in machines for pegging boots and shoes. Patented Jan. 17, 1854.

James Hults, Berlin Township, Ohio, for improvement in gun-locks. Patented May 16, '54.

THE GREAT COAL FIELDS.

HEAP the coal into the furnaces. Turn it into gas. Construe it into any form for fuel or for light. There is no danger that the race can exhaust it. The old folks used to fret for fear the woods would give out, and the world in its last days go chattering and shivering to bed with cold. But, packed away between the rocks, yet so near the surface as easily to be reached, lie millions of cords of fuel that have been seasoning "from the beginning."—He who takes care of Know-Nothings and Irishmen alike, just as if both were fit to live, when he gave the earth's surface for their habitation, did not omit to dig a cellar and put coal enough in to outlast all who would ever want it. This cellar reaches from the polar circle to the tropic of Cancer, and for almost every apartment of our house of many gables there is a door and stair-case to reach it.

More than 15,000,000 tons are annually dug from their fire great deposits, and consumed in England and Ireland. From the 250 mines of Belgium, in 1837, there were taken 1,500,000 tons of anthracite and bituminous coals. And the fields of it that underlie our continent are far beyond all the exhaustive powers of our race as it is possible to exist here for centuries. We have been struck with the immensity of these fields, even so far as they are now known, on an examination of a geological map lately published by Phillips, Sampson & Co., of Boston, in connection with President Hitchcock's *Outline of the Geology of the Globe.* Beginning at the north-east, there are 10,000 square miles of it, embracing the whole of Nova Scotia and much of New Brunswick. A deposit is found in the south-eastern part of Massachusetts and in Rhode Island, not yet much worked, but covering an area of 500 square miles. The great Appalachian bed, starting in Pennsylvania, embraces in its south-western reach much of Ohio, Virginia, and Kentucky, runs nearly across Tennessee, and spreads in three sections, like the tail of a prodigious whale, across the centre of Alabama. Its length is 720 miles, its area 100,000 square miles. Another field reaches from far south of the Ohio into Kentucky, north-westward across Indiana and Illinois to the Mississippi, and occupies an area that could scarcely be crowded within the boundaries of Illinois,—say 55,000 square miles. Then underlying the oak-openings and rolling prairies of Michigan is another field of 12,000 square miles. Still another grand field, which Professor Owen sets down at 50,000 square miles, finds its southern boundary on a line parallel to the Osage River, and its northern in a latitude in Iowa, as high as Albany. Then there are fields found in Texas, New Mexico, Kansas, and Nebraska, and doubtless further surveys will show them in the Great Basin, and on both the sloping sides of the Rocky Mountain range. President Hitchcock, saying nothing of those west of the Missouri fields, reckons an area of coal fields within the spaces we have designated of more than 225,000 square miles. Twenty-eight States like Massachusetts might be built on its broad foundations; and if the average thickness of the beds were put at 50 feet—a moderate estimate, every miner will say—the coal of the United States would be a body equal to three and a half millions of cubic miles! Pity that, with such treasures under our feet, we should have to pay fire and six dollars for enough to boil our tea-kettle for a month. But if Europe continues to send us men so plenty to work these mines, and Yankees continue to invest their money in the machinery to do what unaided men cannot, we shall soon have enough of it, at rates "within the reach of the poorest."—*N. Y. Tribune.*

AN OHIO NOVELTY.

UP in Bryan, Williams Co., Ohio—in the town—there is a novelty which is surely to be exceeded in curiosity anywhere. All over the village the people are favored with natural fountains. The Item thus describes the novelty:

It is supposed that there is an underground lake, at the depth of some forty or fifty feet, of considerable extent, as water has been found when bored for, for several miles around. This is also apparent from the fact, that every new well that is bored affects the strength of others in its immediate vicinity, until its stream is elevated by means of a stock to an equal height. The amount of water discharged by these fountains, however, is not proportionate or equal — they vary considerably in different parts of the town, the strongest one being generally east of Main street. The water can be raised in proportion to the stream forced up. There are several that fill a two-inch auger hole at the height of eight feet above the surface of the earth, and the others issue a somewhat smaller stream to the height of twelve or fifteen feet. Some of the larger ones frequently throw up fish, and we are told that there is a very strong fountain about a mile east of this place, in which fish of a blackish color, of the length of three inches, have been seen.

The work of procuring water is simple and easy. There are seldom any stones met with, to obstruct the course of the auger, and but one or two days are required usually to sink a well, of five or six inches in circumference,—the necessary depth. Water is found at an average depth of 42 feet. The auger passes through a loose sand until it strikes what is called "a hard pan," a bed of solid blue clay, of from two to three feet in thickness, and of such a nature that it requires a drill to penetrate it. Immediately below this "hard pan" lies the water embedded, it is supposed, in quicksand, as for some days, in some instances weeks, large quantities of fine white sand are ejected by the water, but the stream finally becomes pure and clear and no sand is afterwards seen.

No season or state of the water has an effect upon these living fountains—nor drought nor flood can change their currents—they are ever the same—their source is inexhaustible, and therefore they cannot fail.

IMPROVED LIFTING JACKS.

THREE applications for patents for improvements on lifting-jacks have recently been made by Robert W. Genung, of Blooming Grove, John Jenkins, of Monroe, and Dubois & Smith, of Craigsville, all in New York State. The improvement of the first relates to making the lever capable of being adjusted so as to be thrown in and out of contact with the rack-bar, and retaining it securely in its place after being adjusted, by providing the bearings with a curved slot, and two semicircular fulcrum rests, for the purpose of allowing the rack-bar to descend freely after it has been raised to the proper height.

That of the second consists in providing the standard with adjusting notches on its front side and ratchet teeth on its back side, in combination with the adjustable lever, having a fulcrum and pawl attached to it, so as to be set for elevating carriages to different heights.

The other relates to a mode of making the fulcrum of the lever adjustable, to suit carriages of different heights, and also making the seat of the lever self-adjusting when the weight of the carriage comes upon it.—*Sci. Am.*

PAPER IN GREAT BRITAIN.—The proprietors of a leading London journal offer to pay to any person who shall first succeed in inventing or discovering the means of using a cheap substitute for the cotton and linen materials now used by paper makers, the sum of $5,000.—We trust the appeal may be successful. There is a great scarcity of paper at the present time. Stationers are at their wits' end to supply orders, and newspaper proprietors in a state of apprehension at the enhanced value of an article which has risen nearly 25 per cent.—*English paper.*

THE Boston Atlas, in an elaborate article upon the vast extent of the leather manufactures of Massachusetts, says:—"To give an idea of the magnitude of this branch of trade it will be sufficient to state that Massachusetts makes every year very nearly two pairs of shoes for every man, woman and child, in the United States."

Educational.

[Written for the Rural New-Yorker.]

THE TEACHER.

Among the superior demands of the present over former times, that for an improved class of instructors commends itself to particular attention. The demand is, no doubt, being gradually answered, but perhaps a brief statement of some of the chief points in it may not be entirely profitless. And first, it may be assumed that this demand is not wholly, nor even principally, for increased scientific attainments—for more accomplished scholars, or more skillful communicators of knowledge, (though these are by no means matters of indifference)—is not merely for more competent and faithful interpreters of text-books, but for more complete and efficient *educators* in the most generous sense of the term. The number of less than mediocre persons to whom is entrusted the education of children, is indeed surprising, and it is vain to expect the general attainment of a high degree of excellence in what makes up the whole character, moral and mental, of the individual and his consequent standing in society, until the development of capacity in youth is placed in different hands. A commendable sentiment of gratitude toward those who, we cheerfully acknowledge, labored earnestly, if not always wisely, for our advancement, causes us to overlook and apologize for the deficiencies of early instructors; they taught us what we went to learn, and we were at the time satisfied; but as we look back upon them now, how many of us are not compelled to acknowledge that the majority of them were persons of really feeble character, and how many of us can recall among the entire number one decidedly able individual, or one at all calculated to draw out the possibilities of others?

The importance of early establishing the foundation for success in *life*, as well as in *business*—of teaching how to become useful and honorable members of society, as well as skillful mathematicians and accomplished linguists—of educating the heart in the love of truth and humanity, as well as the hands in dexterity, the tongue in eloquence, and the brain in cunning, is becoming daily more and more recognized, and it is certainly desirable that the influences of school should be partly directed toward these ends. That they have not been thus applied in such measure as the importance of the object would warrant, will appear to any one familiar with the ordinary routine of school exercises, and the results avowedly aimed at. Teachers have hitherto done little in comparison with what will, at perhaps no very distant day, be required of them, toward forming the characters of their pupils to a lofty virtue and a generous usefulness; so far, they have in general been more easily excused for failing to present in their own persons examples of nobleness, than for not being able to afford all the intellectual aid asked of them. These things are destined to be changed. Men absorbed in business are more and more leaving to public instructors, not only the mental, but also in good part, the moral training of their children, and teachers must prepare to meet this added responsibility—must qualify themselves to give proper direction to the mental activities of their pupils—to cultivate in them refined tastes—to excite habits of inquiry and personal, critical examination of all questions affecting the well-being of the race—in short, to send them forth with a larger stock of ideas, and better apparatus for gaining more than can be possessed by such as have been subjected to mere mathematical and grammatical drill.

No person need ever hope to fill, creditably to himself or serviceably to others, the office of teacher, if he be not above feeling ashamed of that or any other useful vocation. No matter whether his adoption of this particular calling was determined by original choice, or by the limitations of circumstances—whether outward conditions urge him to exertion, or whether he is impelled to it by reverence for Divine command and a generous desire to do something toward advancing the general good; enough, that he recognizes the claims of his calling, and is both able and willing to answer them faithfully.. But it cannot be denied that certain members of the pedagogic corps, as well as of other crafts, betray an unworthy sensitiveness to the estimation in which their employment is held by individual lack-brains of the more established professions, and by aristocratic idlers. A man whose equanimity is disturbed by contemptuous remarks or invidious comparisons from such sources, or who pays their authors the too high compliment of defending himself and his employment against, or in any way regarding their attacks, gives the most effectual encouragement to a repetition of them, and perhaps does not manifest the most genuine respect for himself or his office. Dignified silence and an undeviating pursuit of the course sanctioned by his own judgment, is the wisest answer that can be made by the object of such foolish prejudice, and the only one he will generally care to make if entirely satisfied with his own position. Men are vulnerable to taunts on the subject of business pursuits only through failure to appreciate the equal worth and honor attaching to all necessary and useful employments, whether requiring mental or manual toil, and the immeasurable moral superiority of willing industry over proud, disdainful idleness. The wise teacher, then, while acknowledging no office more honorable than his own, will not selfishly seek to exalt that above any other employment, but on all proper occasions strive to inculcate the true democratic doctrine of labor—will proclaim the equal merit due to all who engage earnestly and willingly in any department of useful industry.

Ability to make such a presentation of the true object of study as will excite the interest of the scholar, without recourse to the prize system or other similar expedients, may be set down as a prime qualification for successful teaching. Indeed, is it not time that all interested in educational affairs, array themselves against the too prevalent practice of offering premiums to stimulate the ambition of pupils, and thereby quietly but effectually inculcating the notion that the great worth of knowledge lies in its exclusiveness—in the consequence it confers, and the superiority it gives its possessor over the less learned? Such a system tends to encourage selfishness and perhaps superficiality. Where the leading object in the acquisition of learning is the hope of enjoying a momentary triumph, knowledge is only a means to a very unimportant and unworthy end, and will not be likely to make a very deep impression on the mind. Besides, the practice which this system favors, of rapidly and indiscriminately cramming the brain of the learner with what has been produced by the minds of others, must be somewhat unfavorable to the proper unfolding of what lies in his own, and consequently the great object of education be partially defeated by the superior encouragement thus given to the exercise of the receptive over the creative faculty.

The cultivation of a literary taste will really present itself to the mind of the thoughtful, large-visioned teacher, as one of the chief objects in the education of youth; indeed, any system that does not give great prominence to this end must be short-sighted and imperfect. Of course this taste is not to be directed merely to polite literature, so called, but to the whole field of literary effort; to poetry, history, philosophy, natural science, politics, &c., and especially to the intellectual and social movements of the age in which the learner lives. The youth whose attention has never been directed to subjects of general interest among men, enters society under very unequal and unfortunate circumstances, and is forced to acknowledge how much more advantageous to a man who has to do with the world, is an acquaintance with the principal daily occurrences, than the dry learning hoarded up at school. How many College graduates, familiar enough, perhaps, with ancient lore, but utterly ignorant of the aims and tendencies of the nineteenth century, can be counted upon next commencement-day! In truth, men gain in the school-room, or in the period especially devoted to their education, but a small part of the culture that will be of use to them as members of society. Quadratic equations and binomial theorems, however much they may have charmed the student of mathematics in his school-days, must give place to an interest in current events, when one comes to take part in active life. I instance mathematics with no intention to speak disparagingly of a science to which the world is so much indebted, but as usually occupying a large share of the time and attention of the student, and evidently contributing less to the object mentioned at the commencement of this paragraph, than languages and kindred studies; for, perhaps, no one will question that if a boy or girl devote two or three hours each day to translating a fine piece of poetry or oratory from some foreign language into his own, he will be more likely to derive from the exercise a strong incitement to literary culture, than if he spent the same amount of time with mathematical studies.

If evidence be wanting of the defective nature of the present educational system, it may be found in the obvious fact, that not unfrequently those who are by nature gifted with superior talents, but who have not enjoyed what are termed liberal educational advantages, are able to make a more brilliant appearance, and effect a greater amount of good in the world, than others apparently equally fortunate in natural endowments, but who depend for success on acquired ability, and that sort of *bringing out* supposed to be gained in schools and colleges. The cause of this would seem to be, that the native genius of the former had free, unrestricted play, while that of the latter was subjected to a cramping, repressive system wholly unsuited to its need. While seeking to avoid every thing of this nature in the intellectual discipline of those under his charge, the judicious teacher will caution them against the common error of reading too many *small books*—books that merely lead one along on the same plane. What we need in order to be constantly growing, is to fasten upon those who are above us, and who have strength to lift us up into a higher observatory than that from which we have been accustomed to survey mankind and their affairs.

Comparison of the known with the unknown, not merely what is known or unknown by one, but by all, will present itself as the most effectual corrective of the scholar's vanity; and while taught by the trials and discouragements that beset the path of the pioneer in science, to prize what has been gained, he will learn a deeper reverence for those profounder mysteries that seem destined to baffle through all time, the utmost efforts of human inquiry.

South Livonia, N. Y., 1854. A.

The Essayist.

THE TOMB OF DANIEL WEBSTER.

It is a characteristic and beautiful feature of true republican simplicity, that the ashes of great men reposing in the bosom of their kindred earth, are surmounted by no gorgeous mausoleum or majestic tomb. Purveyors; vulgar moneyed aristocracy, so called; men and women of vulgar tastes and barren brains, who have become suddenly rich from successful business speculations, or the rise of property purchased originally for a very trifling sum, may erect splendid mansions, blazon their carriages with armorial bearings, dress their servants in livery, and build miniature Grecian temples as a place of repose for their ashes; but such men as WASHINGTON, ADAMS and JEFFERSON, JACKSON, CLAY, CALHOUN and WEBSTER, sleep their last sleep in a narrow home of very humble pretensions.

The tomb of DANIEL WEBSTER is a simple grassy mound, such as is most fitting for the repose of the dead. It is enclosed by a plain iron fence, and surmounted by a marble slab, with the words, "DANIEL WEBSTER," cut in relief upon a sunken ground. It is one of the oldest burial places in New England, about thirty-five miles south-east of Boston, and within a few miles of Plymouth, and in the present town of Marshfield. The tomb is upon a rising ground overlooking the sea and the country around, and is three-fourths of a mile from the highway. It occupies the site of an ancient Puritan church, many years ago abandoned and torn down; and in the yard repose, also, the remains of PEREGRINE WHITE, the first European child born in the Plymouth colony, Governor WINSLOW and family, and others identified with early New England history.

DANIEL WEBSTER needs no monument to perpetuate his fame. His life has passed away like a tale that is told, but his memory and his works remain a rich legacy to posterity. He filled up the full period of three-score-years-and-ten, which are allotted to man on earth, with honor to himself and distinction to his country; and went to his rest, peaceful and serene as the full-orbed sun shedding a halo of glory over the world he leaves behind, long after his declining beams are quenched in the bosom of the Western seal

PHILOSOPHICAL LECTURES.

In our last lecture to you, boys, on the subject of steam, we endeavored to show, in a familiar and comprehensive way, how that elastic gas was generated, and the wonderful amount of its expansive power; that heated, in connection with water, it would burst the strongest bonds, and, if not allowed vent, would lay in ruins everything within its reach. It is our purpose to show you, in this lecture, how the inventive genius of man has turned this property to account, and rendered steam a giant operator to work the behests of his own will; conquering with it time and space, and bringing the ends of the earth, so far as communication is concerned, into close proximity; compelling it to grind the grain, drive the loom, saw the tree, dress the stone, wield the sledge, tunnel the mountain, sink the shaft, and do all those herculean labors, which have "raised the savage," *without the whip*, "into the amenities of civilized life."

Heat, or more properly caloric, as you probably know, expands all bodies. The blacksmith, when he wishes to set a wagon tire, builds a circular fire of chips and bark, on which he lays the iron until it is heated, and then slips it in this condition, upon the wheel. A band that would under no other circumstances fit the felloes, would, when heated, slip on easily; and as it cools and contracts it binds the enclosed circle of wood, closer than the strongest vise. But the greatest amount of expansive power is gained when a liquid or solid is changed into a gaseous and elastic form. Thus, a few pounds of powder, or gun-cotton, when ignited, turns instantaneously into an elastic fluid of such immense volume, as to blow to pieces all opposing barriers; and, acting in a single direction, sends a missile of destruction in the shape of a Paixhan ball, two or three miles, with a velocity sufficient to batter down a wall, or sink a ship. Water, alcohol, or mercury, heated sufficiently to become a vapor, creates a pressure that cannot be resisted.—The question then occurs, how this pressure can be turned to account, after it has been once created; and in the matter of steam, the way in which it is done will be explained by the following free and easy illustration.

If we take a strong iron kettle, half full of water, shut in by having the lid riveted upon it, and a stop-cock attached to the spout, so that no steam can escape, and then apply heat to the kettle, a pressure will be created sufficient, if the heat is kept up, to burst the kettle asunder. Now, if we take a common churn (of the same size all the way up) and have the dasher made to fit so tight that no steam could pass it, and then let the end of the kettle spout connect with the bottom of the churn, underneath the dash, it is evident that if the stop-cock be opened so as to allow the steam to pass into the lower end of the churn, the pressure on the dasher head would push it up to the top of the churn, even if it was heavily loaded. Now, if a crank should be attached to the dash handle outside the churn, the crank would be turned half-way round, while the dash was going up. Let us now *reverse* the steam, and pass it into the churn *above* the dash, and let that already used to push it up, fly off into the air; it is plain to be seen that the steam would push the dash *down* again to the bottom; and the handle in its descent would pull the crank the other half way round; both halves made by one upward and one downward stroke of the dash put together, make one whole revolution of the crank; and you have only to produce any successive number of upward and downward strokes of the dash, to make one-half that number of revolutions of a wheel attached to a crank shaft.

Do you understand it, boys? if so, I will let you think of it for a week, and in the next lecture illustrate the action of steam in driving a locomotive. The kettle is the boiler, the churn is the steam cylinder, and the dash is the piston of every reciprocating steam engine. Not many others are now in use, as the reciprocating engine is the most perfect and economical in every respect.

THE FOUR MASTER SPIRITS.

Happening to cast my eyes over the portraits in a gallery of paintings, I remarked that they were so arranged as to give four personages—Alexander, Hannibal, Cæsar and Bonaparte—the most conspicuous places. I had seen the same before, but never did a similar train of reflections arise in my bosom, as when my mind now hastily glanced over their several histories.

Alexander, having climbed the dizzy heights of ambition, and with his temples bound with the chaplets dipped in the blood of countless nations, looked down upon a conquered world, and wept that there was not another to conquer, set a city on fire, and died in a disgraceful scene of debauch.

Hannibal, after having, to the astonishment and consternation of Rome, passed the Alps—and having put to flight the armies of this "mistress of the world," and stripped three bushels of gold rings from the fingers of her slaughtered knights, and made her very foundations quake—returned to his country to be defamed, to be driven into exile, and to die at last by poison, administered by his own hand, unlamented and unwept in a foreign clime.

Cæsar, after having taken eight hundred cities, and dyed his garments in the blood of his fellow-men—after having pursued to death the only rival he had on earth—was assassinated by those he considered his nearest friends, and at the very point in which he had gained the highest object of his ambition.

Bonaparte, whose mandate kings and priests obeyed, after having filled the world with the terror of his name—after having deluged Europe with tears and blood, and clothed the world in sackcloth—closed his days in lonely banishment, almost exiled from the world; yet, where he could sometimes see his country's banner waving over the deep, but which would not, or could not, bring him aid.

Thus, these four men, who, from the peculiar situations of their portraits, seemed to stand as representatives of all those whom the world calls "great"—those four men who made the earth tremble to its centre—severally died—one by intoxication, the second by suicide, the third by assassination, the last in lonely exile.

How vain is the greatness of this world!—How fearful is the gift of genius, if it be abused! Who, that is now living, would not rather die the death of the humble, righteous man, than that of Alexander, or Hannibal, or Cæsar, or Napoleon?

CHURCH AND STATE.

Mr KENZIE's *message*, urging the policy and propriety of selling the clergy revenues in Canada, and sending the churches to their respective societies for voluntary support, says:

While England admits our right to control the Reserves—while she owns that her act of 1840 was an undue interference with that right—*her legislation* of 1853, votes at least $1,800,000 of *our money*, to the priesthoods who are believers according to Pope Pius, the Papa of Canterbury, John Knox, John Wesley, Doctor Pusey, the Arminians, the Calvinists. We must pay churches with the Bishop of Rome as their infallible head—churches with a handsome young lady as their chief "who can do no wrong"—churches with Christ as the chief corner stone. All this we must do to prop the State—for a buttress to strengthen "British connexion"—a black coat police against the progress of democracy!

A MAN may have a thousand intimate acquaintances, and not a friend among them all. If you have one friend, think yourself happy.

Sunday Reading.

THE VILLAGE PASTOR.

THERE in his allotted home
Abides, from year to year, a genuine Priest,
The shepherd of his flock; or, as a king
Is styled when most affectionately praised,
The Father of his people. Such is he;
And rich and poor, and young and old, rejoice
Under his spiritual sway. He hath vouchsafed
To me some portion of a kind regard;
And something also of his inner mind
Hath he imparted,—but I speak of him
As he is known to all. [*Wordsworth.*

A POLITICAL PARABLE FOR THE PEOPLE.

—HEARKEN unto me, ye men of Shechem, that God may hearken unto you.

The trees went forth on a time to anoint a king over them; and they said unto the Olive-tree, Reign thou over us.

But the Olive-tree said unto them, Should I leave my fatness, wherewith by me they honor God and man, and go to be promoted over the trees?

And the trees said to the Fig-tree, Come thou, and reign over us.

But the Fig-tree said unto them, Should I forsake my sweetness, and my good fruit, and go to be promoted over the trees?

Then said the trees unto the Vine, Come thou, and reign over us.

And the Vine said unto them, Should I leave my wine, which cheereth God and man, and go to be promoted over the trees?

Then said all the trees unto the Bramble, Come thou, and reign over us.

And the Bramble said unto the trees, If in truth ye anoint me king over you, then come and put your trust in my shadow; and if not, let fire come out of the bramble, and devour the cedars of Lebanon.—*Judges*, ix. 1–15.

In his address before the N. Y. State Ag. Society at their Annual Fair in 1845, Hon. JOSIAH QUINCY, JR., remarking upon the political influence of the agricultural class, gave a telling homily upon the parable above quoted, which we here reproduce, as in the ten years which have nearly elapsed, it has become almost as though it were not to the present generation of readers. Our text is the oldest practical disquisition in existence, and is remarkable as showing the similarity of political aspirants in all ages.

It is now more than three thousand years since JOTHAM called to the men of Shechem to listen to a parable:—"The trees of the forest went out to choose a king over them, and they said unto the Olive-tree, Reign thou over us." The answer shows who was meant by the Olive:—"Should I leave my fatness, wherewith by me they honor God and man, and go to be promoted over the trees?" It was the answer of a religious and conscientious man, who feared that public station would not be favorable to the virtues which were the objects of his life.

"And the trees said to the Fig-tree, Come thou and reign over us; but the Fig-tree answered, Should I forsake my sweetness and my good fruit, and go to be promoted over the trees?" Could a better personification be found of a close, calculating man, who looked out for the main chance, and took special care of number one? It was his own sweetness and good fruit that influenced his decision.—The emoluments of office such a one knew were small and precarious, and as for honors, he would not give a fig for the whole of them.

"Then said the trees to the Vine, Come thou and reign over us." The Vine was one of your popular fellows who can take hold of anything to help himself up;—who is always on the fence when nothing higher offers, and who, too pliant to stand alone, will run well if supported. But his vocation was "to cheer the hearts of gods and men," and as office-holding and popularity did not agree very well together, he declined the honor.

"Then said *all* the trees to the Bramble, Come thou and reign over us." There were two reasons why this call alone was unanimous. He had nothing particularly to do, and he kept himself perpetually before the public.—He had nothing particularly to do—he had neither wine nor oil, beauty nor sweets to recommend him. He was a fit representative of a class who then existed. Nobody could tell what they were made for, and nobody could divine what they followed for a living. But yet the Bramble was not one to be forgotten. He planted himself by the wayside, and caught hold of everybody that passed. There was no getting along for the Bramble; and it may be that they made him king on the same principle that young ladies sometimes marry an importunate lover—to get rid of him. And how did the Bramble receive his nomination? Did he distrust his powers, or decline the office? Oh no! He was up for everything, and up to anything. He could not boast much of himself, so he strove to magnify his office. "And the Bramble said, If, in truth, ye anoint me king over you, then come and put your trust in my shadow; if not, then let a fire come out of the Bramble and devour the cedars of Lebanon."

Such was the opinion of JOTHAM, three thousand years ago, on the probable feelings and conduct of rulers who were placed in authority without the requisites for office. He believed that a fire would go out of the Bramble to destroy the noblest and most elevated in the land. By the Bramble he meant ABIMELECH, who was elected King of Shechem, because his mother was a native of the city. His course was as JOTHAM had foretold; a fire did go out of the Bramble. He slew three-score-and-ten men of his brethren on one stone.—And as for Shechem, and its people, he took occasion of their revolt, and put every man, woman and child to the sword, burned the city with fire, sowed it with salt, and left a warning to future ages, of the danger of putting, through folly or affection, improper men into office.—R.

Miscellaneous.

FARMERS' GIRLS.

Up in the early morning, just at the peep of day,
Straining the milk in the dairy, turning the cows away,
Sweeping the floor in the kitchen, making the beds up stairs,
Washing the breakfast dishes, dusting the parlor chairs;

Brushing the crumbs from the pantry, hunting for eggs at the barn,
Cleaning the turnips for dinner, spinning the stocking-yarn,
Spreading the whitening linen down on the bushes below,
Ransacking every meadow, where the red strawberries grow;

Starching the "dress" for Sunday, churning the snowy cream,
Rinsing the pails and strainer down in the running stream,
Feeding the geese and turkies, making the pumpkin pies,
Jogging the little one's cradle, driving away the flies;

Grace in every motion, music in every tone,
Beauty of form and feature thousands might covet to own,
Cheeks that rival spring roses, teeth like whitest of pearls—
One of these country maids is worth a score of your city girls.

[*Tribune.*

ON THE SETTING SUN.

Those evening clouds, that setting ray,
And beauteous hints, serve to display
Their great Creator's praise;
Then let the short-lived thing called man,
Whose life's comprised within a span,
To him his homage raise.

We often praise the evening clouds,
And lights so gay and bold,
But seldom think upon our God,
Who hinged these clouds with gold.

[*Sir Walter Scott.*

THE BELL-BUOY.

Bell-Buoy, phonographically spelled, has very different significations to ears nautical and to ears terrestrial; but spelled in the old fashioned, Anglo-Saxon, non-progressive, and perhaps after all the better way, the interpolation of a u, marks significantly the nautical bell-buoy from his landsman brother.

The noble steamship, as she nears a dangerous coast, where rocks and sunken shoals lay concealed beneath the surface, is not unfrequently saved from wreck by the timely warnings of the bell-buoy. Darkness and fog shut in the light of day; the faint glimmerings of the beacon perched upon the adjoining cliff, is unable to penetrate the gloom, and even the fierce bright blaze of the Fresnel light, that crowning production of optical science, is powerless against the thickly settling gloom and horror. The compass, faithless to its trust, warped from its line of duty by some local attraction, more powerful because in closer proximity than the far-off pole, is pointing in a direction that will inevitably produce wreck; and the Master of the noble craft, following its direction, is dashing on, unconscious of danger. In imaginary security, the crowd of passengers are enjoying themselves at the prospect of a speedy and happy termination of an ocean voyage. They are nearing port, and the rising and setting of one or two more suns will see them safely moored in the docks of their own loved shores. The tireless engine labors on unceasingly, moving backward and forward day and night its herculean arms, as with a more than giant's power it revolves the immense wheels, and drives the huge ship through waters beneath.

But hark! the tolling of a bell strikes upon the ear—faintly, and afar off it seems, amid the roaring of the sea, as the waters are tossed up in white foam by the ware-compelling wheels. It is not far off, however, but in close proximity. The officer of the deck, ever watchful and alert, has caught in alarm the first faint sound; the pilot signalizes the engineer, at his post below, to reverse the engine, and instantaneously the huge wheels commence a counter revolution, throwing the white foam up to the very figure head of the ship; the huge hull taken suddenly aback, creaks and quivers in every plank and timber; the helm, turned hard aport, sends the vessel off upon another track, and, just grazing a beetling cliff, that is now seen to loom up fearfully out of the mist, she glides close beside a sunken rock, and escapes into deep water.

The whole thing is so sudden, so terrific, and so quickly over, that it seems like a brief vision of the night; one of those fearful dreams that come upon us in an instant, and then vanish away. Not a cry is heard, not even an exclamation of terror, for the danger is past before it is half comprehended by the uninitiated spectator; but when it is understood, the passengers give utterance to their profound gratitude to God. The countenance of the iron-visaged Master, however, remains unchanged and rigid, as if every muscle was cast in bronze; but those accustomed to read the expressions of a seaman's face and eye, can see that a tempest within has come and gone, and that the soul, undaunted even while the peril lasted, has resumed its wonted and unruffled tone.

What was it saved the gallant ship and its priceless burden of human freight? The tolling of a bell attached to a buoy! The ceaseless pulsations of the great deep—the eternal beatings of the ocean's heart—the rise and fall of the bosom of the sea, as if moved by an internal power of respiration, give impulse to a floating buoy, which, by its motion, tolls incessantly the warning bell, and gives notice of danger to the unwary or bewildered mariner, when the lights of heaven are shrouded in gloom, and the terrestrial beacon upon the cliff is obscured by mist. Such is the bell-buoy of the ocean; and the bell-buoy of terra-firma will be duly chronicled in another chapter.

[Written for Moore's Rural New-Yorker.]

OLYMPIAS, THE MOTHER OF ALEXANDER THE GREAT.

[A Rabbinical Tradition, compiled from the Talmud.]

After the death of Alexander the Great, in Babylon, one of his generals brought a letter to Olympias, the contents of which were as follows:

"Alexander sendeth his mother a final greeting! In this writing thou wilt receive the news of my death. I wish and hope that thou wilt not, as is the custom of mothers, break forth in loud and bitter laments. Weep not! Mourn not! I was, indeed, a great prince; but thou knowest that everything passeth away. The greatest empire crumbleth into dust, the mightiest monarch dieth, and his dominion is ended. The tree, that to-day spreadeth his strong arms far and wide, may be uprooted by the storm to-morrow. The flame, that blazeth with greatest splendor, is soon extinguished; the blooming flower of the morning is withered in the evening, and everything vanisheth like a shadow and a dream!

"If thou wouldst truly honor the names of thy son, then erect a gorgeous palace, adorn it with everything that is precious, and give a banquet to my memory. Invite kings, princes, generals, and every distinguished man; but let it be proclaimed that no one appear at the banquet, who had suffered any wrong; but let every one come with joy and gayety, for it must be a day of great cheer."

The mother of Alexander shed not a tear. In compliance with her son's last request, she ordered a palace of great dimensions to be erected; she adorned it with gold, variegated pictures and statues, so that it was the most magnificent mansion on earth. When all the preparations had been completed, she invited the kings, princes, and the other great men of her empire. The day of the festival was drawing nigh. The halls were fragrant with the odor of myrtles and pomegranates, waxen candles burned, and the queen traversed the rooms of the palace, feeling an inward satisfaction in fulfilling the last will of her son.

Hour after hour passed away, and the sun was already lowering on the horizon, but no guest appeared, and the queen walked in solitude through the magnificent apartments. At length she called one of the generals, and said: "Is it thus that the friends of Alexander honor his memory and my command? Has not one appeared?"

"Noble princess, replied the general, "dost thou forget the contents of thy proclamation? Thou saidst that he only should come, who never suffered or was aggrieved. No one has come, and no one will come; for there is none on this earth free from pain or sorrow."

"O Alexander! Alexander! my son," cried Olympias, "thy wisdom was as great as thy valor; thy consolation hath mitigated my grief;" and she repeated the words of her son: "The tree that to-day spreadeth his strong arms far and wide, is uprooted by the storm to-morrow; the flame that blazeth, is soon extinguished; the sun is darkened by the clouds, and the full moon soon loseth her effulgence; the stars disappear, and princes vanish like a shadow and a dream."

The blossoms of myrtles and pomegranates breathed fragrance, and the candles burned splendidly; and Olympias, without a tear, left the banqueting-hall. S. T.

Advice to Parents.—Be ever gentle with the children God has given you; watch over them constantly; reprove them earnestly, but not in anger. In the forcible language of Scripture, "Be not bitter against them."—"Yes, they are good boys," I once heard a kind father say, "I talk to them pretty much, but do not like to beat my children—the world will beat them." It was a beautiful thought, though not elegantly expressed. Yes, there is not one child in the circle round the table, healthful and happy as they look now, on whose head, if long spared, the storm will not beat. Adversity may wither them, sickness fade, a cold world frown on them; but amid all, let memory carry them back to a home where the law of kindness reigned, where the mother's reproving eye was moistened with a tear, and the father frowned "more in sorrow than in anger."

To Ruin a Son.—1. Allow him to have his own way.
2. Let him have plenty of money.
3. Let him roam about on Sunday.
4. Let him be disrespectful to his parents.
5. Give him bad companions.
6. Call him to no account for his evenings.
7. Give him no steady employment.

Rest satisfied with doing well, and let others talk of you as they please. They can do you no injury, although they may think they have found a flaw in your proceedings, and be determined to rise on your downfall, or profit by your injury.

A DEN OF HORRORS.

Kirwan, in a recent volume of Travels in Europe, gives the following account of a fearful chamber in the castle of the Duke of Baden Baden, in Germany:

But the underground apartments possess fearful interest. With lighted torches we went down into the cellar of the palace; thence by a spiral inclined plane, we went down, down, until, by a door of one huge flag, and fitted to its place with remarkable exactness, we entered a small oval room, perhaps ten feet in diameter, and hewn out of the solid rock. The door was shut behind us, and we were under the mountain! A ray of light came from above, and we could look up, as through a narrow chimney; a stone was removed beneath our feet, and we could look down perhaps two or three hundred feet, and could see a little glimmer of light upon a dashing current whose murmurings came to us from beneath. And all around the room were seats cut out of the rock. And what was the object and history of this awful room?

Its history, as given us by our guide, and within its walls, is briefly as follows:—In the days of feudal clemency, and inquisitorial piety, those suspected of political or religious heresy, were suddenly seized and confined in some of the adjacent cells. The little room above described was the room of judgment, and the judges were let down by machinery through the opening above. The accused were then introduced, and the heavy stone door was shut! And there, shut out from every eye save that of God and their judges, they were tried and condemned. If not guilty, the accused were hated or feared, which made condemnation worse than guilt. When condemned, they were commanded to kiss the image of the Virgin in the apartment; in the movement, they touched springs, which caused her to embrace them, and in the embrace, to pierce them thro' with daggers. Then a trap was sprung beneath their feet, which let their bodies fall upon a wheel, armed with knives, which was kept in a constant revolution by a stream of water; by those knives they were cut in pieces, and the mutilated fragments fell into the stream below.

And there we were receiving this awful narrative in the very apartment where these atrocities were committed in the name of justice and religion, with the tunnel beneath us, through which the bodies of their victims were let down for mutilation, so as to be beyond the reach of recognizance! For a moment our blood ran cold, and we were filled with horror! Oh! if those stone seats, and those walls of solid rock could speak—if the injunctions of perpetual secresy were removed by Him who upheaved the mountain, what an awful narrative they would give of the scenes of treachery, hatred and blood there perpetrated in the name of God and Religion!

The stone door swung open, and we groped our way through a labyrinth of chambers and passages, dark as midnight, into the open air. We all breathed easier, and a feeling of fear gave way to one of security. We were soon after on the railway for Frankfort-on-the-Main, deeply affected by the beauty and wickedness of Baden Baden, thankful that its days of penal tyranny were at an end.

WHAT GEO. S. HILLARD SAYS.

"To a young man away from home, friendless and forlorn in a great city, the hours of peril are those between sunset and bed-time, for the moon and stars see more evil in a single hour than the sun in his whole day's circuit—The poet's visions of evening are all compact of tender and soothing images. It brings the wanderer to his home, the child to its mother's arms, the ox to his stall, and the weary laborer to his rest. But to the gentle-hearted youth who is thrown upon the rocks of a pitiless city, and stands "homeless amid a thousand homes," the approach of evening brings with it an aching sense of loneliness and desolation, which comes down upon the spirit like darkness upon the earth. In this mood, his best impulses become a snare to him, and he is led astray because he is social, affectionate, sympathetic and warm-hearted. If there be a young man thus circumstanced within the sound of my voice, let me say to him that books are the friends of the friendless, and that a library is the home of the homeless. A taste for reading will always carry you into the best possible company, and enable you to converse with men who will instruct you by their wisdom and charm you by their wit, who will soothe you when fretted, refresh you when weary, counsel you when perplexed, and sympathize with you at all times. Evil spirits, in the Middle Ages, were exorcised and driven away by bell, book and candle; —you want but two of these agents, the book and the candle."

Anecdote of Gibbon.—One of the drollest occurrences in the annals of gallantry is related of Gibbon, the historian, who was short in stature, and very fat. One day being with the beautiful Madame de Crouzas, he dropped on his knees before her and made a declaration of his love in the most passionate terms. The astonished lady rejected his suit, and requested him to rise. "Rise, Gibbon, I beseech you, rise." Mr. Gibbon still kept his posture.—"Mr. Gibbon, will you have the goodness to get up?" "Alas, Madame," faltered the unlucky lover, "I cannot." He was too fat to regain his feet without assistance. Madame de Crouzas rang the bell, and said to her servant, "Lift up Mr. Gibbon."

The longer we live in this world of roses and thorns, the more we learn to revere those philanthropic axioms: "Bear and forbear;" "Live and let live;" and to reverence a faith whose Christian founder has made it a condition of having our trespasses forgiven that we should forgive the trespasses against us.

Men of the noblest dispositions think themselves happiest, when others share their happiness with them.—*Taylor.*

HEART MUSIC.

BY MRS. JENNY A. STONE.

Whence art thou roaming,
Lovely of my soul?
The river's bright waters
Still songfully roll;
Leaping in music
That dies on the shore,
But the music within me,
I hear it no more.

I listen at twilight,
My spirit is still,
But the night-birds are singing
O'er valley and hill;
Then memory's waters
All hopelessly surge,
The whippowill's warble,
It sounds like a dirge.

I sit 'neath the maple
Ere sunset has fled,
And dream of the absent,
The false and the dead;
I lean my hot forehead
Against the rough bark,
It cannot like deeper
Than grief's crushing mark.

I sigh for the glory
Now faded and fled,
I sigh for my gladness
When first we were wed;
Mine eyes to yon heaven
All tearful I cast,
And wish that my life
With that moment had past.

I have sent thee a message
By many a dove,
A message of patience,
Of faith, and of love;
But the glancing of wings
As they shrinkingly dart,
Seem but to bear with them
Each hope from my heart.

I send a fond prayer
To-night by a star,
It must draw thee hither
Though thou art afar;
Its words are of silver,
In music they roll,
O, heed their sweet voicings,
Thou loved of my soul!

[For Moore's Rural New-Yorker.]

HOME.

Who has not felt the sweet emotions that swell the heart at the thoughts of home? that cherished spot where first our infant tongues began to lisp in broken accents the names of father and mother, brother and sister! Though years may have passed away, and the swift-winged messenger of death may have borne from our fond embrace those cherished ones, and we become strangers in a strange land; yet how oft fond memory flits on unfledged pinions back to the rural retreats of early childhood, when the sunny morn of youth rose brilliantly, and scattered its rosy light over the bright perspective which then seemed decked with the flowers of Eden, but which has disappointed the sanguine hopes of many a bosom, and taught the instructive lesson, "that earthly hope blooms but to fade!" There is also a charm which hangs around the place of our birth, which the changing scenes of after life, or the wasting influence of time, can never efface.

There is no inscription more deeply graven upon memory's tablet, than that which records our childhood's feelings, and the joyous scenes of our early home,—joys, which never felt a care,—scenes, whose summer knew no cloud,—and feelings, whose artless buoyancy would yield to no restraint. That was indeed the spring-time of our being; the period when thornless flowers seemed strewn along life's pathway, through which we were to ramble forever amid fragrance and sunshine. What warm emotions are still excited at the mention of "home!" How many tender sensibilities, how many thrilling recollections are awakened by that simple word! It is the very poetry of life—the centre around which throng the happiest reminiscences of our existence—the greenest spot on which the eye can rest, as it glances down the long vista of by-gone years.

How many, in early life, have bid adieu to the romantic retreats of their native land, and perhaps crossed the foaming billows of the ocean in pursuit of the laureled wreath of fame in far-distant climes. They may have trod the classic shores of Greece, and been fanned by the mild and serene atmosphere of Italy; they may have lingered around the vine-clad hills of France, and reveled on the rich fruit of her vineyards; yet from all these, in the moment of despondency, the forlorn heart has turned away and sighed for home.

So strong is our attachment to home—the place of our birth—that we never can forget it, until the waning taper of mortality shall throw its last flickering ray on all the associations of life, and the fixed sad heart shall beat no more with love's sweet, soothing, soft emotion. This attachment seems to be an innate principle,

> An evergreen that stands the northern blast,
> And blossoms in the rigor of our fate.

It is at home, around the domestic hearth, we realize the greatest share of earthly bliss; there spring the tenderest emotions that swell the human heart, and soothe and soften many of the ills of life. Who would not wish to breathe their last, expiring breath at home, among their kindred and friends? When the cold sweat of death shall settle down upon the pallid brow, who would not wish to repose his languid head upon the lap of conjugal affection, and breathe his life out sweetly there?

Dear reader, have you ever wandered far from the home of your early childhood, and been destined to weep in a strange land? if you have, how oft has your mind reverted to that hallowed spot, while the language of your sad heart has been,

> Sweet home! thy name upon my heart
> Engraved shall ever be;
> Though mountains rise and rivers roll
> Between my friends and me.

Seneca Castle, N. Y. Carrie.

AMERICAN FEMALE LITERATURE.

If any shrewd Futarist had told our grandmothers that two or three generations from their girlhood, women would become a Literary power in America, he would have been set down as a fortune-teller. Our grandmothers could not but smile at such a vain prophecy. For in their day it was fashionable for female talent to employ itself otherwise. A great deal of the work now done by machinery was then done by their skillful hands; and whenever they had leisure, it was devoted to the education of their children. Woman had much more responsibility of a domestic kind fifty years ago, and society expected a far larger amount of service from them. But public opinion has withdrawn itself from such in-doors surveillance. Women have managed these private matters to suit themselves, and without any aid from Conventions or Platform Speeches, have secured themselves greater means of liberty and leisure.

Whatever differences of opinion may exist as to the merit of our recent female writers, there can be no doubt as to their popularity and influence. Neither Irving nor Cooper has been read in anything like the same numerical ratio as Fanny Fern, Miss Wetherill, and others of the same class. The fact is significant. No doubt, their talents have had a share in this unprecedented popularity. But it were folly to attribute the result to this cause mainly. There is no sort of proportion between the genius shown in these volumes and the immense sales they have had. The true reason is a combination of circumstances, among which are to be enumerated the present prepossession of the public mind in favor of anything good that ladies undertake to do, and consequently the ease with which they secure the public ear. Women of any intellectual force find the American world more than ready to do them justice. They are really anxious to admire them. If an American woman of pretension and position writes an inferior book, she cannot be half so sorry for it as the tender-hearted public.

There is something in this, to be remembered by our aspiring women. To make men, you must treat them as air-condensers treat the water in a fire engine—put six or eight additional atmospheres in pressure on their brains, and by resistance call forth their strength. They must have obstacles to surmount—suffering to test their fortitude—dangers to arouse their courage. Facility in the sense of easiness is the worst enemy of manly genius. But for the impediment in Demosthenes' utterance—the misfortunes in Sir Walter Scott's circumstances—the poverty of Burns, and the deformity of Byron—their genius would never have impressed the world so potently. But womanly mind loves sympathy, admiration, praise. The fragrant atmosphere which these create, must float around the plant of her genius ere it can flower in Summer fullness.

What, then, are the tokens? They are very favorable to the ladies—altogether, indeed, on their side. For here and *nowhere else*, are they just in the social position to give scope to all their genius. Whatever a woman is or has, she is very sure of full reciprocation in these States. She always has the open ear, the inviting heart, of the best public; and thereby her sensibilities are put exactly in such a relation to her intellect as to supply all the inspiration she can use. A good time is coming for her in this country; and strangely enough, Republicanism is destined to effect more for her than for the other sex. Our prophecy is—that the most popular forms of our future literature will be written by American women. They see to-day, further into the meaning of American life, character, and prospects than men do. They are nearer the hearts of humanity—deeper into the spirit of the age—happier in the revealings of faith, than their rivals among men.—*New York Times.*

WOMEN.

The following charming passage is from "Rural Hours," by Miss Cooper, daughter of the late J. Fenimore Cooper. It so beautifully expresses the sentiments of all women of pure feelings and correct principles, that it should be widely circulated:—

"We American women certainly owe a debt of gratitude to our countrymen for their kindness and consideration of us generally.—Gallantry may not always take a graceful form in this part of the world, and mere flattery may be worth as little here as elsewhere; but there is a glow of generous feeling inward woman in the hearts of most American men, which is highly honorable to them as a nation and as individuals. In no country is the protection given to woman's helplessness more full and free—in no country is the assistance she receives from the stronger arm so general—and no where does her weakness meet with more forbearance and consideration. Under such circumstances, it must be woman's own fault if she be not thoroughly respected also. The position accorded to her is favorable; it remains for her to fill it in a manner worthy her own sex, gratefully, kindly and simply; with truth and modesty of heart and life; unwavering fidelity of feeling and principle, with patience, cheerfulness and sweetness of temper—no unfit return to those who smooth the daily path for her."

MOORE'S RURAL NEW-YORKER

ROCHESTER, JULY 15, 1854.

To Agents and Others.

A new half volume of the RURAL commenced last week—a favorable time to subscribe or form clubs for either six months or a year. Agents and other kind friends throughout the country are requested to give the matter such attention as may be consistent with their engagements. The RURAL will be furnished for six months, from July to January, at half the yearly rates, or as follows:—Three copies for $2,50; Six copies (and one free to agent) for $5; Ten copies (and one to agent) for $7,50; Twenty copies (and one to agent) for $12,50.

The Sixth Volume of THE WOOL GROWER AND STOCK REGISTER,—improved and enlarged to 32 pages monthly—also commences the 1st of July. We will furnish the two journals, *one year*, at the following low rates:—Three copies of W. G. & S. R. and one of RURAL for $3; Five copies W. G. and two of RURAL for $5; Nine copies W. G. and three of RURAL for $8; Twelve copies of W. G. and four of RURAL for $12. ☞Specimen numbers, &c., of both journals sent free to all applicants.

Our National Anniversary.

THE Anniversary of our National Independence passed off in this city with the usual amount of joyful demonstration, and without any very serious or alarming accident. A few pyrotechnics exploded in store windows prematurely, and one or two persons were run over, but not much injured; a few bloody noses were made in a pugnacious way, but nothing further of a warlike character occurred. The procession was imposing, the oratory and other exercises of the day creditable, but the fireworks in the evening, owing to a rain-storm, and perhaps some other causes, were a failure. Taken all in all, the Anniversary was pleasantly and properly observed, and enjoyed in the right spirit, both by ancient and young America.

The day was generally observed throughout the country, in many localities with the usual concomitants of crime and casualty. Foremost among the latter, was the wholesale slaughter of men, women and children on the Baltimore and Susquehanah Railroad, an account of which is given in another place. The heat of the weather, in Albany, was very severe, and occasioned death in three instances, and prostration by sun-stroke in several other cases. A party of Norwegian emigrants were in the city, and three of them died from the effects of the heat. Three of the members of the military in the city of New York were struck with the heat, and died shortly after. Some fifteen other persons also, in that city, suffered mutilation, from the loss of a limb down to that of a finger, from the careless use and bursting of guns, pistols, &c. A German woman was shot dead by the careless discharge of a double-barreled shot-gun in the hands of a countryman. MARCUS BALDWIN, at Connecticut Farms, New Jersey, was drowned in the presence of two of his sisters. He drove his horse into a pond to let it drink, and got beyond his depth. At Susquehannah, on the Erie Railroad, Rev. Horace R. Clark, appointed at the recent annual session of the Wyoming Conference to the Susquehannah and Lanesboro' Mission, was crossing the street unaware of the proximity of the cannon, and not hearing the warnings of the bystanders, when a premature discharge of the ordnance happened exactly as he came within its range, stunning, scorching and bruising him in such a horrible manner that he died almost immediately. While a national salute was being fired at Johnstown, N. Y., the cannon burst, shockingly mutilating one of the men engaged in loading. At Trenton, N. J., the accidental discharge of a gun mutilated two men so that each had an arm amputated in consequence.

Among the crimes may be enumerated the usual amount of drunkenness and fighting. At Philadelphia an affray occurred on the receiving ship Marion, between two seamen. One of them struck the other with a club, fracturing his skull, and causing immediate death. A keeper of a lager beer saloon, near New Schuylkill, was killed during a riot, in which his house was badly shattered. In Manchester, N. H., a fight took place between a large party of Americans and Irish. The latter were routed, and twelve or fifteen of their houses gutted, and furniture destroyed. The Americans then attacked the Catholic church, breaking the windows, when the authorities and police stopped the riot. Several Americans were seriously injured. The new Catholic church in Dorchester, Mass., was blown down with gunpowder, and nearly all destroyed. A woman named MARGARET ELLIS was murdered in Buffalo by FRED. MITCHELL. In Cincinnati an Irishman attacked an American wearing a Know-Nothing hat. The American killed him with pistol and bowie-knife.

So it goes throughout the world; glory and honor, pleasure and exhilaration, high enjoyment and intoxicating excitement, go hand in hand with crime, casualty and death!

CONFLAGRATION.—A heavy fire occurred in Philadelphia on the night of the 5th, destroying WELCH'S National Circus, the Chinese Museum, and between thirty and forty large stores and dwellings. The loss has been variously estimated, and probably will not fall short of $300,000. An actor perished in the flames, and several other persons were badly burnt, one of them mortally.

THE schooner Darlington foundered on Lake Ontario on Tuesday, and four persons perished.

The Wheat Crop—Harvest.

We have heard nothing during the past week, which would induce a modification of the opinion expressed in our last number, relative to the Wheat crop. Though some of our city papers seem inclined to estimate the damage by weevil as comparatively trifling, we are satisfied that it will prove serious in many sections of this State, Ohio, and other portions of the West.—Within ten days we have received letters from farmers, merchants, and post-masters, in corroboration of the statement that the crop will be short in many of the best wheat growing districts of Western and Central New York, Ohio, and Michigan—and we have the verbal assurances of many intelligent persons residing in various localities, to the same effect. Hence we more than fear that the crop will be very light—in fact a failure—throughout a large portion of the best wheat growing regions of New York, Ohio, Michigan and Indiana. Though the damage by winter kill and the weevil may be overestimated, there can be no doubt that it will prove large in the aggregate.

The Wheat Harvest commences in this section the present week, though but few fields have yet been cut. The weather is now favorable, and the prospect fair for securing the crop. We trust the result will prove a larger yield, and better quality of grain, than is now anticipated by farmers generally.

Railroad Casualty.

IT is our painful duty to record another fearful railroad casualty, such as chills one's blood to contemplate, in consequence of its wholesale slaughter! On the day of our National Anniversary, about five o'clock P. M., an excursion train of fourteen cars, containing 2,000 persons, on the Baltimore & Susquehannah Railroad, came in collision with a regular train nine miles from Baltimore, killing thirty-six persons, and wounding more than one hundred others. The shock was awful, and the momentum was so great as to slide several of the car-bodies completely through each other, like the tubes of a telescope, killing and maiming the passengers within. The wreck was so complete, that the broken cars had to be torn asunder by attaching locomotives to the fragments, in order to extricate the dead and wounded, many of the latter perishing before assistance could be rendered.

These excursion trains, especially on single-track railroads, are the most perfect death-traps ever invented by an emissary of Satan. They run at irregular hours, and, in consequence of the heaviness of the trains and inadequacy of locomotive power, are sure to be behind time, and running on that of the regular trains. Add to this the chances of the employees on a Fourth of July occasion being drunk, excited, and reckless, and the late lamented collision is easily accounted for.

The Coroner's Jury severely censure the railroad management, and it is hoped the guilty parties will be prosecuted, and made to suffer condign punishment for this wholesale murder.

COMMENCEMENT AT THE UNIVERSITY.—The commencement exercises of the Rochester University have been in progress during the week. The annual sermon before the Judson Society of Inquiry was preached on Sunday evening in the First Baptist Church, by the Rev. J. O. WARREN, of Troy. The preacher spoke eloquently from the text contained in Hebrews 2: 10—"For it became Him, for whom are all things, and by whom are all things, in bringing many sons unto glory, to make the Captain of their salvation perfect through suffering."

On Monday evening the Sophomore class declaimed in Corinthian Hall. Tuesday forenoon was devoted to the preaching of the annual sermon by the Rev. Dr. SHELDON; the afternoon to the ceremony of inaugurating President ANDERSON, and the evening to the literary address by Hon. HENRY J. RAYMOND, of the N. Y. *Times*, and the poem by CHAS. TURNER, of Worcester, Mass. The graduating ceremonies and closing exercises took place on Wednesday.

RIVAL CITIES.—According to the *Transcript*, Boston, a hundred years ago, outnumbered New York in population by two or three thousand people, but soon New York came up with her, and in the year 1810 Boston had 33,000 and New York 96,000. This proportion was about maintained for several decades until the last, when New York had some 515,000 to 136,000 in Boston. The latter city is now left so far behind in the race of commerce and population, as to cease any longer from being considered a competitor. Many of her houses which established branches in New York, have become themselves mere appendages to the junior establishment. Even the newspapers of Boston are principally confined in their circulation to New England, while those of New York are sent by the car load, to all parts of the United States.

NEW HAMPSHIRE POLITICS.—The Administration have suffered a signal defeat in the New Hampshire Legislature. HADLEY, the Hard candidate for State Printer, has been elected over BUTTERFIELD, the friend and favorite of General PIERCE. The House passed a series of strong Anti-Nebraska resolutions, with instructions to present a copy to the President, the Senators and Representatives of New Hampshire, Senator DOUGLAS, &c. After an indefinite number of ballotings for U. S. Senators, the whole matter goes over to the next Legislature, which gives the people an opportunity to elect Representatives with direct reference to this issue. No effort was spared by either party to effect the choice of their own candidate.

Stupendous Frauds.

WALL STREET was last week startled, as by a clap of thunder from a clear sky, by the astounding intelligence that Mr. ROBERT SCHUYLER, an extensive stock operator and President of the New York and New Haven Railroad Co., had surreptitiously over-issued 19,000 shares of the stock of that Company, amounting at par value to $1,900,000, and sold it on his own account. Peculiar facilities for perfecting this fraud, were afforded, as the President was also the transfer agent of the Company, and consequently there was no check upon the over-issue by countersigning parties.

Unless there has been some irregularity in the issue sufficient to put purchasers upon their guard, the Company will probably be compelled to assume the liability, which at a single stroke reduces the value of their stock two-fifths; the original amount being $3,000,000, which is now made $5,000,000. The firm of SCHUYLER & Co. heretofore has been one of unlimited credit, but it has lately been rendered bankrupt by Railroad speculations and depression in stocks. Several other corporation officers have likewise been detected putting out over-issues, and these transactions have given to rotten as well as to sound Companies a sad shock, and a severe rattling of corporation bones.

Death of Thomas Ritchie.

THOMAS RITCHIE, the venerable editor of the *Richmond* (Va.) *Enquirer*, which paper he has conducted for fifty years, died on the 3d of July. He was near eighty years of age at the time of his death, and during the whole period of his editorial life, wielded a more powerful political influence, especially throughout the South and South-west, than any other political editor.—He was a forcible writer, an uncompromising partisan, and in all respects a leading man. A candidate of his own party was as sure of defeat if he incurred the censure of the *Enquirer*, as he frequently was of election if he gained its support. Mr. RITCHIE's political course was as bitterly denounced by his opponents, as it was warmly supported by his friends; but in his private life, all unite in pronouncing him an amiable, accomplished, and honorable man.—Like many others who have spent their lives fighting in the political arena, he died, pecuniarily, not far above poverty, although the U. S. printing, which was awarded him under the administration of Mr. POLK, somewhat mended his fortunes.

HARVESTERS WANTED.—The St. Louis Intelligencer of the 29th ult., states that a very large portion of the wheat crop in St. Charles, and other counties in Missouri, will likely be lost for want of harvesting hands. Two and as high as three dollars per day is being paid for hands to work in the harvest fields, and many farmers cannot get them at that. Every reaper and scythe in the country is running from early dawn until dark, and still there are hundreds of acres of over-ripe grain untouched.

Mowing Machine Trial.

CANANDAIGUA, Friday, July 7.

In the case of Howard and others *versus* Forbush and others, in the U. S. Circuit Court, Judge Hall presiding, a verdict has just been rendered by the jury in favor of plaintiffs on every issue. The jury found first, that Wm. F. Ketchum was the original and first inventor of the improvements in mowing machines claimed in his re-issued patent of April, 1853. Second, that the re-issued patent of Ketchum of April, 1853, is for the same inventions desired and intended to have been patented in his original patent of July, 1847; and third, that the Forbush machine embraces both the foregoing claims, and is an infringement of Ketchum's re-issued patent.

FATAL ACCIDENT—DEATH OF PROF. MCFAIL.—A party of the students belonging to the Carlisle (Schoharie Co.) Seminary, accompanied by Prof. Alfred McFail and others, proceeded on Saturday last to explore the celebrated Cave, located a few miles from the Seminary. They had closed their explorations, and were returning, when an accident occurred which resulted in the death of the Professor. It happened in this wise: The party had been in a pit of some hundred feet deep, and all had ascended by means of pully ropes, except Mr. F. He was ascending, and had nearly reached the platform, when, by some means, he slipped from the rope seat, and fell to the bottom of the cave. On being approached, he was found senseless, and died in a few minutes. He was a gentleman of rare endowments, well beloved by the students, and highly respected by all. He leaves a stricken wife to mourn his sudden departure.

PARLIAMENTARY AND COMPLIMENTARY.—THOS. H. BENTON thus compliments Senator PETTIT, of Indiana:

WASHINGTON, June 17, 1854.

JAMES HOWE, Esq., Lafayette, Ind.—Sir: Your letter has just been received, informing me that Mr. Pettit, in a public speech in your town, stated that I was the first man to break the Missouri Compromise—that I had a law passed by Congress, annexing to the State a large territory, &c. Sir, your Senator is a great liar and a dirty dog, falsifying public history for a criminal purpose. * * * * * *

Mr. Pettit must feel that his cause is villainous when he can thus stand up before his constituents to falsify public history, and to justify his own violation of the Missouri Compromise, by telling a lie upon me.

Respectfully, THOMAS H. BENTON.

ANOTHER RAILROAD CASUALTY.—The express train which left the Suspension Bridge, going west on the Great Western Railroad, on the evening of the 5th, came in collision with a horse at Thorold, throwing two emigrant cars off the track, killing seven, and severely wounding ten more, part of whom are not expected to live. All the first class passengers and employees escaped unhurt.

News Paragraphs.

☞ A gathering of five or six hundred Abolitionists took place in Framingham, Mass., on the 4th inst. Speeches were made by Messrs. Garrison, Phillips, Remond, and others. Mr. Garrison concluded his speech by burning the Constitution of the United States, also copies of the Fugitive Slave Law, the decision of Loring, and Judge Curtis' charge to the United States Grand Jury. The act was followed by applause, and cries of shame, &c.

☞ There was a report in circulation about London that Carlyle had gone mad. It arose from the fact that one of his neighbors kept fowls, whose noise near the library windows annoyed him. He sent word to their owner one day that if they were not removed, they would drive him mad. The owner of the hens probably took his eccentric neighbor at his word, and gave out that he had gone mad.

☞ Alex. Dumas's chateau of Monte Christo, built by himself, on an island of the Seine, near St. Germain, has been sold by auction. It cost the romancer over 450,000 francs, and is a charming residence for those who love the fantastic. It brought but 31,000 francs. Just now, country houses may be had for little or nothing. Rossini's villa, at Asnieres, is for sale at 40,000 francs, less than half its cost.

☞ It is stated on the authority of the Catholic Herald, that Mrs. Ives, the wife of the late Episcopal Bishop of North Carolina, had followed her husband into the Romanish communion. It is said that her reception took place at Rome on Good Friday. On the following Monday she received confirmation at the hands of Cardinal Fransoni, with two other perverts, Mr. and Mrs. Schenck.

☞ The Bangor Whig learns from an Oldtown correspondent, that there are 600 acres of logs, in many places two or three deep, in the booms above that place—the main boom being filled to Ebet's Point two miles, the Cuba boom three-fourths of a mile, and the Argyle boom three miles—making six miles of logs, covering an average breadth of fifty rods.

☞ During the confusion incident to the sinking of the steamboat Buffalo, at New York last week, a German immigrant who had a trunk of treasure and a treasure of a wife on board, threw his wife overboard and dragged the trunk ashore. The woman was rescued by the bystanders, and restored to the arms of her affectionate spouse.

☞ The Washington Star announces authoritatively that when sealed package, chargeable with letter postage, is opened in presence of a postmaster, and found to contain printed matter only, without anything secreted therein, the postmaster may remit the letter postage, and deliver the package at the rates charged for printed matter.

☞ Lady Franklin refuses to accept a widow's pension. Sir John, she says, is not dead. Acting, however, in accordance with the contrary conviction expressed by the Lords of the Admiralty, the Prerogative Court of Canterbury has granted probate of the will made before his embarkation by Mr. Thomas Blanky, master of the ship Terror.

☞ Some fiend in human shape recently placed twin babes about a week old, on the track of the Railroad from Chicago to Davenport. They were discovered by the engineer of the train, which was stopped just in time to refrain from running over them. The conductor took possession of the babes, and intends to rear them.

☞ A goose belonging to Mr. James Rooke, of Chester county, Pa., died the other day at an advanced age. It came into the possession of Mr. Rooke on his wedding day, thirty-three years ago, being the property of his wife. It was probably near forty years old at the time of its death, to which age, it is said, a goose will live.

☞ Charles Francis Adams has nearly completed the collection of the last volume of the works of his grandfather, John Adams. The publication of them will soon be commenced. They will embrace ten volumes. Four additional volumes are also to be issued, containing the family correspondence, Mrs. Adams' letters, &c.

☞ The cable of the Mediterranean Electric Telegraph has just been completed. It is 110 miles in length, and weighs about 800 tons. It contains copper wires or conductors for the fluid to traverse, protected by a gutta percha covering, secured in hempen rope, and finally surrounded by twelve iron wires.

☞ The number of females at present holding the office of Postmaster (or rather mistress) in the United States, is 123. They are appointed, give bonds, are commissioned, and receive the same compensation for their services as other Postmasters. Unmarried females *only* can hold the office of Postmaster.

☞ Mr. Marsh, U. S. Minister at Constantinople, says that the lands belonging to Rev. Dr. King, American Missionary in Greece, which were sequestered by the Greek government, were worth $100,000, and that the only chance for redress lies in the action of the government of the United States.

☞ The St. Louis Republican advises parties who have arranged excursions to Jefferson Barracks on the 11th, to abandon their intentions, as the sickness of the troops at that post is such as to render visits of large companies quite hazardous.

☞ The New Hampshire Superior Court, at its late term, held at Concord, heard arguments in eighty-three divorce suits. Thirty-three of the applications were granted, seven denied, and the decision of forty-three reserved.

☞ The religious statistics of Texas are as follows:—Baptists, of all varieties, 9,000; Presbyterians, 6,000; Episcopalians, 2,000; Methodists, number not known, but larger than that of any other denomination in the State.

☞ The Houston Star says that the grading of the Galveston & R. R. railroad, under Major Burke's contract, is progressing rapidly. Only a mile-and-a-half remains to finish the first twenty-five miles out from Houston.

☞ The value, in sterling money, of the imports and exports of France in 1853, was £138,600,000, being an excess of £15,120,000 over 1852, and £35,480,000 over 1847—the year preceding the revolution.

☞ Two bodies, one that of a female, and the other a young lad, were found floating in the river below Niagara Falls on Sunday week. Nothing was found upon them by which they could be identified.

☞ Joseph Emery, the Postmaster at New Vineyard, Me., has been sentenced to ten year's imprisonment for purloining a letter containing $150. Verily, the way of the transgressor is hard.

News Brevities.

—— The jail of Wyoming Co., at Warsaw, N. Y., is tenantless of prisoners.

—— Six persons died of sun-stroke in New Orleans, on the 29th of June.

—— The movement in favor of a decimal coinage in England is progressing.

—— New and valuable coal beds have been discovered in South-western Kentucky.

—— The re-construction of the Wheeling Suspension Bridge is being rapidly pushed on.

—— A famine, unparalleled in the history of the country, is prevailing in the land of Judea.

—— The valuation of the real and personal estate of the city of Portland, this year, is $18,962,514.

—— There are two hundred and seventy-one prisoners in the Indiana State Prison, at Jeffersonville.

—— The Niagara Iris says "the village is rapidly filling with visitors from all parts of the Union."

—— Capt. Bodisco arrived from St. Petersburgh recently, with despatches to the Russian minister.

—— The Central Association of Universalists in Illinois, met in Pekin, Illinois, on the 13th and 14th of May.

—— A boy fell from the high scaffolding of the new Presbyterian Church, in Detroit, and was instantly killed.

—— The receipts on the Central Railroad during the month of June, amount to more than *half-a-million* dollars.

—— About 1,000 people signed the call for the Anti-Nebraska Mass Convention held at Jackson, Mich., on the 6th inst.

—— Murrell, who kidnapped Solomon Northup, was arrested near Fonda lately, he having been recognized by Solomon.

—— Among the passengers lost in the steamer City of Glasgow, was Rev. J. S. Reynolds, of the Baptist Church in Portsmouth, Va.

—— Work is at a stand at present on the Attica and Allegany Valley R. R., in consequence of the tightness of the money market.

—— Lieut. Payne, U. S. A., died at Jefferson Barracks on Friday week. Some cases of cholera have appeared, it is said, at that post.

—— The National Intelligencer predicts that in 1856, the Whigs will elect to the Presidency some sterling old school National Whig.

—— The President has sent instructions to Gen. Persifer F. Smith, at Texas, to call out volunteers to quell the Indian disturbances.

—— Every shell fired by an army, during siege operations, costs, with the powder with which the mortar is charged, the sum of $8.

—— The United States Circuit Court, at New Orleans, is proceeding vigorously against the parties supposed to be implicated in a design upon Cuba.

—— The Western Texan learns that there are now between seven and eight thousand head of cattle and other stock on the way to California from Texas.

—— A grant of $10,000 has been made to the Wesleyan University of Connecticut, on condition that $30,000 shall be raised by the friends of the institution.

—— R. W. Eskridge, of Sumpter county, Ala., has been sentenced to the Penitentiary for eleven years, for maliciously shooting and wounding one of his slaves.

—— A young lady eloped from Washington on the 2d, to escape a forcible alliance with a disagreeable lover. She met her favorite in Baltimore, and was married.

—— The papers at the east, south and west, report the weather to be exceedingly warm. In many places the thermometer has indicated from 90 to 100 degrees in the shade.

—— The Troy Whig of Wednesday week says, that on Monday last snow lay on the Green Mountains, east of Burlington. The peaks of the mountains were white for miles.

—— The Alexandria, Va., Gazette deprecates the division of the Whig party, and says that the Whigs of the South do not desire to see political parties made sectional ones.

—— The annual Convention of the Protestant Episcopal Church of the Diocese of Western New York, will be held in Trinity Church, Utica, on Wednesday, the 16th of August.

—— Nearly sixty patents, or about ten each day, have been issued within a week. The whole number of new cases favorably decided will probably exceed 3,000 for the past year.

—— Cassius M. Clay is announced to speak on the repeal of the Missouri Compromise, at Quincy, Ill., on the 12th inst., and at several other places at different times during the month.

—— Horace Vernet, commissioned by the government to transfer to canvass such episodes of the Danubian battles as may seem to deserve it, leaves Marseilles for Constantinople soon.

—— During the month of June 39,363 emigrants arrived at the port of New York; 11,117 were Germans, 18,950 British, 7,000 French, and the remainder Spaniards and West Indians.

—— An unknown man deliberately placed his neck on the rail of the Michigan Central Road, a few days since, as the train was approaching. His head was instantly severed from his body.

—— Advices from Barbadoes to the 15th ult., have been received. The cholera was raging fearfully at that place; deaths averaging 400 per day. The total number of deaths thus far is 5,000.

—— The very last dog story is told of a fine Newfoundland at Sunderland, Georgia, which seized a carter by the throat and threw him down, because he was beating his horse without reason.

—— The Philadelphia North American says that grass hoppers, in innumerable swarms, infest the fields in many parts of Eastern Pennsylvania, carrying devastation to all vegetation of the fields.

—— The time of receiving proposals for the purchase of the main line of public works of Pennsylvania has expired; and as no bids were made, no sale can now be made without further legislation.

—— Wombwell's famous black-maned lion, "Waltheo," almost the last of the species in England, died lately at Kidderminster. The carcass has been purchased by a Shrewsbury naturalist.

—— A man named Miller visited the Buffalo Cemetrey on the morning of the 2d, selected his place of burial, gave a description of it to a friend, and in two hours, while bathing, was drowned—apparently accidentally.

Literary Notices.

COLTON'S ATLAS OF THE WORLD, Illustrating Physical and Political Geography. By Geo. W. Colton. Accompanied by descriptions Geographical, Statistical and Historical, by R. S. Fisher, M. H. New York: J. H. Colton & Co.

This great work, which has been for some time in course of preparation, is now being issued from the press. We have an earnest of its progress in the receipt of Part I, containing four maps, with descriptive letter-press, of Canada East, Massachusetts and Rhode Island, Mississippi and Spain and Portugal.

This Atlas is one of the most complete and beautiful works of the kind ever published. It has two divisions—one giving a map of every State and Country in North and South America and the West Indies; and the other comprising the above mentioned, and all the countries in the other hemisphere, including the Islands. "The maps exhibit all the works of public improvement, projected or completed, and are accompanied by sheets of letter-press, of very beautiful typography, giving a full description of the resources, commerce, and progress of the several States and countries, with statistics of population. The size of the maps is imperial folio, and there will be 108 sheets, with 180 maps and plans. The Atlas having been submitted to the inspection of a committee of the American Geographical and Statistical Society, they report a high commendation of the work, as respects its apparent accuracy and comprehensiveness, as well as the artistic style of execution manifested in the parts already completed. They say, the result has been the best Atlas of the United States ever yet published, and one which may be safely resorted by the geographers of the other hemisphere. There will be found recently boundaries and towns in all the States of the Confederacy, post towns, railroads completed, projected, and in progress up to this time, and plans of most of the larger cities and towns."

The Atlas is to be completed in twenty-seven parts or numbers, each containing four or more maps, with letter-press descriptions, and is furnished to subscribers at $1 per number—and on completion of the work a handsome embossed cloth cover, with leather back, will be furnished gratis. The work is altogether creditable, and we trust will be appreciated by the public generally. Mr. H. N. Lockwood, now at the Eagle Hotel in this city, is general agent for the publisher, and wishes to engage sub-agents throughout the country.

A POPULAR ACCOUNT OF THE ANCIENT EGYPTIANS. Revised and abridged from his larger work, by Sir J. Gardner Wilkinson, D. C. L., F. R. S., &c. In two volumes. Illustrated with 500 wood cuts. New York: Harper & Bro's.—1854.

This work is chiefly an abridgment of one written by the author in 1836,—with the addition of other matter, the author having re-visited Egypt, and later discoveries having been made, since that time. The volumes contain, in a condensed form, a vast amount of information on the most interesting topics pertaining to the general subject discussed, while the profuse illustrations and copious index enhance their value and attractiveness. We are glad that such a work has been thus placed within the reach and means of the masses, and have no doubt it will become popular. For sale by Darrow & Br.

UTAH AND THE MORMONS. The History, Government, Doctrines, Customs, and Prospects of the Latter-day Saints. From personal observation during a six months' residence at Great Salt Lake City. By Benj. G. Ferris, late Sec'y of Utah Territory. New York: Harper & Bro's.—1854.

In a volume of some 350 pages our author has given a large amount of apparently reliable information on matters concerning which much is said, but little really known.—The work embraces a very complete history and expose of Mormonism as it was and is—including an account of the introduction of Polygamy, its efforts, &c. Aside from the interest and value of its contents, the work is well illustrated and printed, and is destined to become popular.—For sale by Darrow & Br.

FOOTPRINTS OF FAMOUS MEN.—Designed as Incitements to Individual Industry. By John G. Edgar, Author of "The Boyhood of Great Men." With Illustrations.—New York: Harper & Bro.

This work sketches prominent individuals in four classes. 1. Men of Action; 2. Men of Letters; 3. Artists; 4. Men of Science. It is evidently well calculated to effect the object stated, and we commend it to the attention of all young men and students. Darrows.

California News.

Arrival of the George Law.

The George Law, with two weeks' later news from California, reached her wharf July 10.

She brings the California mails of the 10th of June, and from Australia to the 10th of May.—She also brings 448 passengers, and $1,154,233 in treasure on freight.

Among the passengers are Capt. H. A. Adams, of the United States Navy, and bearer of despatches from Commodore Perry, of the Japan expedition. Among the despatches of Commodore Perry is the Japan Treaty.

The California markets were generally dull, and prices were drooping. Money market unchanged. Real estate dull. The mining news are satisfactory. Several new discoveries are reported. The tunnel and water companies were doing better than ever.

The wheat and barley crops are exceedingly heavy.

Walker, the fillibuster, has taken the editorship of the Sacramento Journal.

There have been several squatter riots, but they were quelled without serious loss of life. In one riot, revolvers, double-barreled guns, and axes, were freely used. George C. Smith, of Rochester, N. Y., was shot through the head and killed. The riots originated in a supposed rejection of the City's title by the Land Commissioners. The San Francisco papers strongly urge an increase of the Police force in that city.

The Branch Mint was actively engaged in manufacturing bars, ingots and coin. Thomas Campbell has resigned as U. S. Land Commissioner. George W. Baker, Recorder of San Francisco, has been indicted for misdemeanor in office. The Court of Sessions quashed the indictment.

The grand jury on the explosion of the steamer Secretary, charged her owners with gross and wilful culpability, and recommended the appointment of a steamboat inspector for the district.

Ex-Collector Saunders has commenced a suit to recover $18,000 claimed as fees while he was in office.

Walker's trial has been postponed till August. He alleges that the expedition was to protect Sonora from the incursions of the Apache Indians.

Advices from Oregon are to June 10th. The election for territorial, county and district officers, resulted in a Democratic victory.

The people of Bellingham Bay, Washington Territory, were anticipating an attack from the Indians on Queen Charlotte's Island.

Advices from the Sandwich Islands are to May 20th. Parliament was in session. The King had proclaimed strict neutrality in the impending European war.

A British sloop-of-war was at Honolulu.

Foreign Intelligence.

Arrival of the Washington and America.

The steamships Washington and America arrived, the one at Halifax, and the other at New York, July 5th.

The destruction of Admiral Brumridge's squadron of war, gun-boats, lighter, &c., at Drahaesluit, on the 30th of May, and at Wierburn, on the 1st of June, is confirmed. The vessels engaged were the Leopard, Odin, and others.—Ten thousand barrels of tar were burned, and several ships laden with cargoes were made prizes.

Fifteen hundred men and marines were landed at Alcabourgh.

The Austrian summons to Russia to evacuate the Principalities, had caused great excitement at St. Petersburgh, and the answer was under discussion. The conclusion of a treaty of alliance between Austria and the Porte, has been officially announced in the British Parliament.

A report was again current that Russia had again made peace overtures through Austria, but the terms are said to be the immediate retirement of the Allies from Turkey.

There is also a rumor in the English papers that the Czar will abdicate, and for that alleged reason did not meet the king of Prussia.

The Vienna papers announced on the 17th, that Prince Paskiewitch had received orders from St. Petersburgh, to retire beyond the Pruth, and thus to surrender to the Sultan that material guarantee so arrogantly claimed, so insolently seized, so feebly and so unskilfully defended.

The siege of Silistria being raised, must alter the whole plan of operations in Bulgaria, and consequently must change the plans of the allies. It is surmised that Paskiewitch will order his whole force to fall back on Jassa. Ere this the Russians have probably relinquished all their positions on the left bank of the Danube, excepting the forts of Hirsova, Matchin, and Usaktcha, and apprehensions of their advance on the Balkans is for the present at an end.

A conspiracy to assassinate the Emperor of France during his visit to the baths of the Pyrenees, had been discovered in the Departments of Loire and Garonne, and 150 arrests were made. The Prefect was dismissed, and M. Ledetsreur, the friend of Lafayette, appointed his successor.

A French agent having arrived at Naples to buy corn, the Neapolitan government immediately forbade the export of breadstuffs.

Great activity prevailed in the Swedish ports.

There has been a great decline in the market for breadstuffs, and prices are still tending downward.

Arrival of the Steamship Baltic.

The steamship Baltic arrived at New York July 8, with four days' later news from Europe. She left Liverpool at 1 P. M. on Wednesday, June 28, having made the run in 9 days 16 hours and 53 minutes, mean time, by steam alone.

The private letters from Constantinople of June 4th, communicate intelligence from Silistria, of which the following is the summary:

After the attack of the 29th of May, which was desperate and sanguinary, the Russians retired to prepare for a fresh assault. On the 31st they advanced in considerable force, and renewed the assault in the same order as before. After a prolonged and bloody struggle, the Russians were repulsed, and the same evening, under a flag of truce, demanded permission to take off their dead, who were not less than 2,000.

On the 2d a general assault took place, and the whole of the forts were attacked by the Russian flotilla, which bombarded the town, but the Russians were again beaten off. The victory, however, cost the Turks dear, as they lost their gallant commander, Mussa Pacha, who was struck in the side by a fragment of a grenade.

The same night a mine which had been carried under the first Turkish battery, was destroyed by a counter-mine, and 400 Russians, the foremost of the attacking column, were blown into the air. Under cover of this explosion, and the confusion that followed, the Ottomans sallied out, and the enemy were routed in all directions, and the intrenchments taken.

The total loss of the Russians in their last assaults is calculated at from 5000 to 6000 in killed, while the Turks lost but little in proportion.

A letter received at Constantinople from Shumla, dated June 4th, announces fresh attacks upon Silistria on the 31st May and 2d June, in which the Ottoman troops obtained a most brilliant success.

The correspondents of two London journals have been arrested on the right bank of the Danube by the Russians.

The official reply of the Czar to the Austrian summons to evacuate the Principalities, was daily expected at Vienna.

The Russians have removed all their heavy artillery from the Danube.

Liverpool Markets, June 27.—Our market was moderately attended this morning, principally by those of the town and immediate neighborhood, who purchased wheat in retail quantities only.

On the best description, we quote a decline on Friday's prices. The milling parcels were much neglected. Sales of flour were effected only to a limited extent, and these principally to consumers, at 37s for Philadelphia and Baltimore, for ordinary; 38@39s for good parcels. Sour held at 34@35s. Indian corn met with slow sale—37s for yellow; 36@36s6d for white. Oats and oatmeal dull. Sales at former quotations.

Deaths.

In Geneseo, on the 3d inst., RICHARD EMORY, infant son of Joseph E. and Isabella (deceased) White, aged three months and nine days.

Commercial.

BUSINESS AND FINANCE.

The steamer George Law arrived at New York on the morning of the 10th, with $1,154,233 in gold on freight.

The foreign steamers have taken out about a million during the week.

Seven millions have been paid, pursuant to the Mexican treaty stipulation. This payment, together with two millions of dollars drawn from the Treasury on the 20th ult., for the payment of the July interest, and a million disbursed for the redemption of stock, will reduce the deposits to $22,000,000.

The stock market has received a very severe shock during the week, in consequence of the development of astounding frauds in the shape of over issues of stock, which have been made by agents of various corporations. The Parker Vein Coal Company explosion (not gas, but financial,) took place some weeks since, but others of a similar character have lately come to light. The following is a list of the more issues of stock so far as at present appears. No wonder when such stupendous frauds are putupon stockholders, that a general feeling of insecurity in reference to corporation property pervades the community:

New York and New Haven Railroad Co.,	$1,000,000
New York and Harlem Railroad Co., stock	
Loans, &c.,	500,000
Naugatuck Railroad Co.,	30,000
New Haven and Northampton Railroad Co.,	20,000
Parker Vein Coal Co.,	7,000,000
Vermont Central Railroad Co.,	1,500,000
Empire Stone Dressing Co.,	100,000
	$11,650,000

These stocks are estimated at par value, which is far above the actual amount realized from their sale by the fraudulent operators. It is by no means certain that all the "rollerarrs of lienmack" has yet come to light, but those interested in corporations are thoroughly aroused, and matters will be likely to get sifted to the bottom and frauds exposed. So mote it be.

Market Intelligence, &c.

RURAL NEW-YORKER OFFICE,
Rochester, July 12, 1854.

There has been a great decline in breadstuffs abroad since our last market report, and if there was any activity in the trade at home, a corresponding decline might have been looked for, but no wheat being in the market the nominal price is two dollars. Flour has fallen in price, and now sells to the trade at $9,75@10. Other grains are unchanged.

There are now two prices for hay; now selling at from $7 to $11, and old from $8 to $16, with a prospect of better prices before the close of the week.

The wool market is yet dull and little offered, farmers holding generally for better prices; quotations are unchanged, although some lots have been sold for 37½c.—Sheep pelts are now quoted at from two to three shillings for unwooled, old ones being out of the market.

Rochester Wholesale Prices.

Flour and Grain.		**Fruits and Roots.**	
Flour, bbl.,	$9,75@10	Apples, bush.,	15@$1
Wheat, bu.,	$2,00	Do. dried,	$1,00

NEW YORK MARKET—July 10.

FLOUR AND MEAL—Market for inferior grades is firmer with better inquiry. Sales $8,15@8,81 for inferior State; $8,25@8,75 for common to straight do.; $7,10@,25 for fancy; $8,16@1,75 for mixed to fancy Western.—Canadian nominal at $7.; Rye Flour and Corn Meal nominally the same.

GRAIN—Wheat market dull and drooping. Rye nominal at $1,18. Corn, sales 58@63c. for distilling, parcel of Western, 62@68c for common to good Western mixed, 74@74½c for Southern yellow. Oats more plenty and lower 50@53c. for State and Western.

PROVISIONS—Pork market still rules in favor of purchaser, with a moderate business doing; $11@11,37½ for mess, $10@10,25 for prime. Transactions in Beef limited; market, however, firm; $12@13 for country mess, $14,50 for city, $16 for re-packed Chicago. Lard dull,—small sales at 9@9½c. Butter selling slowly; 13@17c for Ohio, 17@19c for State. Cheese dull at 6@9½c.

ALBANY MARKET—July 10.

FLOUR AND MEAL—The transactions in Western and State Flour are mainly in a retail way, and confined to the wants of the trade for consumption. In prices we have no change to notice. Corn Meal is selling slowly at $1,44@1,50 ¥ 100 lbs.

GRAIN—We have no sales of Wheat to report. Corn, Western mixed, not strictly prime, but dry, at 67@68c; prime high mixed Western at 68c. In Oats nothing has transpired.

FEED—We notice a sale of 1,900 bush. Corn Sheets at $7½c. per 100 lbs.

BUFFALO MARKET—July 10.

FLOUR—Our market is very dull and inactive this morning and the inquiry is confined to small lots for local and interior trade at $7,50@7,75 for good to choice brands Ohio and Michigan.

GRAIN—Wheat dull and heavy; no inquiry and no sales. Corn in moderate request but the high pretensions of holders restrict business. But little strictly prime offering and holders ask 83c, buyers offer 80@81c. Oats dull and lower, and offered at 40c; no buyers.

Canal Freights are firmer, 12½@15c for corn, 61@63c on flour to New York.

NEW YORK CATTLE MARKET—July 3.

The supplies of Beef Cattle have not come in freely this week. Prices in consequence have advanced a little on the better qualities, but other descriptions remain much as before. The market closed dull, with about 200 head left over. A novel feature, this week, is a lot of cattle from Texas, fed in Illinois.

We quote beef cattle $4@10; cows and calves $30@65; veal calves, (gross) $1,50@3; sheep, (on foot) $3,50@8; lambs $3@6,50; swine, (corn fed) $4,50@4,74; swine, (mast fed) $3,75@4.

At market 90 beeves, and 80 cows and calves, and 50 veal calves. Beef is down from $1. Total, 3,711 beeves, 250 cows and calves, 930 veal calves, 13,610 sheep. Decrease this week 832 veal calves; increase 94 cows and calves, 26 veal calves, 3,970 sheep.

ALBANY CATTLE MARKET—July 10.

At W. Woolford's Bull's Head, Washington street.—Beef Cattle—330 at market. Prices—Extra $8,00; 1st quality $7,50; 2d do, $6,50@7; 3d, $5,50@6.

Cows and Calves—Few in market. Prices range from $35, $40, 45@50.

Sheep and Lambs—1,100 in market. Prices range at from $3,50 to $5 for Sheep, $3@4 for Lambs.

Swine—None in market.

Remarks—Market has been for the last week very well stirred, with both Cattle and Sheep. The majority of the Cattle have been shipped for Brighton market. Sheep and Lambs here sold for the New York market.

CAMBRIDGE CATTLE MARKET—July 5.

At market 260 Cattle—about all Beeves, and no Stores.

Prices—Market Beef—Extra $8,00 per cwt; 1st quality, $8,50; 2d do, $7,75@8,00; 3d, do, $7,50; ordinary, $7.—Hides, ¥ cwt. $6,00@6,50. Tallow $8,50@9. Pelts, 50@75c. Calf Skins, 16c ¥ lb. Veal Calves $5 to $10.

Stores—Working Oxen—No sales.

Cows and Calves—$32 to $47@62. Two years old—$25 to $28@30. Three years old—$32 to $51@72.

Sheep and Lambs—1,083 at market. Prices—Extra—$4,50 to $5,00@5,00. By lot—$2,25 to $3,75@4.

Swine—None.

PROVIDENCE, July 1, 1854.

Wool—The market has been more active, particularly for pulled, which has been taken freely at regular sales.—The following are the sales for the week:

Fleece, 5,000 pounds at from 27½c to 30c; largest sales at 37½c and 41c.

Pulled, 41,000 pounds at from 30c to 47c; largest sales at 39c, 40c and 47½c.

Foreign, 5,400 pounds at from 13 to 32c.

Total sales of the week, 51,400 pounds.

BRIGHTON CATTLE MARKET—July 6.

At market 1,000 Beef Cattle, 75 Cows and Calves, 3,000 Sheep, and 1,075 Swine. 700 of the Swine were fat hogs, still fed.

Prices—Beef Cattle—Prices have declined. Extra $8,-5@8,50; first quality, $7,50@8,00; 2d, $7,00@7,25; 3d, 6,00@6,75.

Working Oxen—None at market.

Cows and Calves—Sales at from $25 to $53. Sheep—Small lots $2,75 to $4,25@4,50.

Swine—Dull and no sales of any account in lots—lots retail from 5¾ to 7c.

KEDZIE'S RAIN WATER FILTERS.

MANUFACTURED BY

J. E. Cheney & Co., Rochester, N. Y.

The use of water impregnated with lime and other mineral substances, is, in the opinion of all medical men, in one of the chief exciting causes of many diseases incident to the varied climate of this country.

These Filters have been fully tested, for many years, by hundreds of families in this city and in various parts of the country, and have in all cases given the highest satisfaction.

Rain water, of whatever color, taste, or smell, by this means becomes as clear as crystal. 230-1and f

THE DANSVILLE MODEL WATER-CURE,

Is one of the most spacious, convenient, and best arranged establishments in the country. The situation for health, and beautiful and romantic scenery is unsurpassed. The main building is 100 feet by 30, and four stories high, with bath rooms on every story, furnished with the *richest* and *purest* water in the world. In front of the building are four porches, making in the aggregate, a promenade of four hundred feet in length. The medical attendance is all that can be desired, and experienced and capable persons are employed as bath attendants. Mrs. Stebbins, female physician, has had several years experience in the treatment of diseases of her own sex. The proprietors and physicians intend to spare no means that can be employed, that will hasten a sure and permanent cure of their patients, and that can render their stay at their establishment pleasant and agreeable.

Address Dr. W. M. STEPHENS,
235-2t* Dansville, Livingston Co., N. Y.

DRILLING IN WHEAT.

Moore's Seed Planter, or Grain Drill.

Patented July 2, 1850.—This valuable implement of husbandry, which has been thoroughly tested in many places, is used for planting Wheat, Rye, Corn, Oats, Barley, Beans, &c. It operates equally well on all kinds of land, and is not injured by coming in contact with rocks, roots, &c.; and it is believed, is superior to any other implement of the kind in use, as may be seen by the testimonials of many of the best farmers in the State. There are several advantages in drilling over broad-cast sowing, among which are these:—It is most expeditious; it saves labor, which is inquiry; it completes the process of seeding in harvest it more; and experience has proved that more grain is obtained, of a heavier berry, and with less seed, owing to its being covered at any required depth, where every kernel has moisture and a chance to germinate.

Drilling Wheat.—Edward Stabler, in his admirable essay on the advantage of drill seeding, states that after examining its results on some 500 or 1,000 acres, besides large experience on his own land, he finds there is not a single instance where it has not proved the most profitable.—First, in the saving of seed, and secondly in the increased product of the grain, amounting to from one to seven bushels in the acre. He had known the increase, in one case, by careful comparison of the two modes, to amount to nine bushels per acre in favor of drilling. He relates an interesting incident:—A farmer offered a drill for the increase in a crop of 50 acres of wheat, to be determined by sowing a few steps broad-cast for comparison; but before the harvest, the farmer preferred paying the hundred dollars for the price of a drill, with interest. On carefully ascertaining the increase, he found it to be one hundred and fifty-three bushels.—*Albany Cultivator.*

Extract from the N. Y. Tribune, Feb. 3, 1853, article on Industrial Exhibitions at the World's Fair, London:

"Those who understand the subject, know that at least one-third of the seed may be saved, and a fourth added to the crop by drilling, as contrasted with the old, slovenly process of sowing by hand. The annual saving by the general adoption of drilling in this country, would be equal in value to all the gold we receive from California."

The highest premiums have been awarded to this Drill at the Agricultural Fairs in Delaware, at Philadelphia, Baltimore, Detroit, in Maryland, and at various County Fairs in Pennsylvania, Ohio, Michigan, and other States.

TESTIMONIALS.

To E. W. Hunner & Co.:—The Grain Drill which we severally purchased of you in 1852, works to our entire satisfaction. Its simplicity, and certainty of distribution, together with its cheapness, commend it in preference to any Drill with which we are acquainted. Samuel Lewis, Esq., York, Liv. Co., N. Y.; Wm. W. Fletcher, Jr., Chas. Hazleton, Elijah Armstrong, Geo. W. Uhl, Leaming Clark, Geneseo; Chas. Hendershott, Andrew Boyd, Mich'd Johnson, Groveland.

Extract of a letter from Mr. McCrone, near Newcastle, Delaware:—"Your Drill stands unrivalled, as is admitted by all Farmers in the neighborhood, that have seen it in operation."

"This is to certify, that we, the undersigned, have used Lewis Moore's Improved Grain Drill, and we believe that for simplicity, durability, cheapness, ease, speed and regularity of sowing, it surpasses anything of the kind heretofore in use among us, and we do recommend it to farmers as being a machine the best adapted to their wants."—Signed, Wm. Llwellin, Lancaster Co., Pena., and thirteen other farmers.

Orders will be received for these machines by the subscribers, who have purchased the right to make and sell them in the Counties of Monroe, Ontario, Wyoming, and Livingston.

Cash prices at the shop,—8 teeth Drills, 8 in a part, $65; 9 teeth do., 7 and 8 in a part, $70; 10 teeth do., 8 in a part, $75; 11 do., 8 in a part, $80. E. W. HUNNER & CO.

Geneseo, Livingston Co., N. Y., June, 1854. 230-3t

PURE WINE.

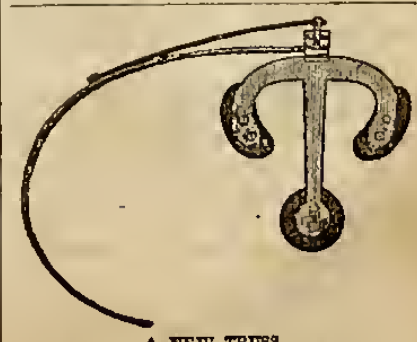
The Subscribe has on hand between sixty and seventy barrels of Wine from nine to four years old, manufactured by himself from native American grapes, which he offers to Physicians, Druggists and others, for Medicinal or Communion purposes. Warranted *pure*—not containing a particle of drugs of any kind, or of spirit except that caused by fermentation. The impression has gone abroad that Wine can not be made that will keep, unless some spirit be added—but it is a mistake. I have made Wine from the grape, where I now reside, between twenty and thirty years, and have never used a drop of ardent spirit. I have kept it until it is years of age, when it was perfectly fine.

It is well known that nearly all the Wines of commerce are made up of materials entirely foreign to the grape, containing many things very deleterious to health, which persons with weak nerves and delicate health, requiring a cordial, can not use. Many have informed me that after trying in vain to use Foreign Wine when recommended, they have procured Wine of me, and it answered all the purposes for which Wine was needed.

I have six or seven different kinds of Wine, made from as many different grapes,—among which are the Catawba, Isabella, Pratt, Muscat, Early York, Empire, &c.; also young Vine Roots of the above varieties for sale.

My Wine is sold also by W. B. Walker, Druggist, Geneseo, N. Y.; Whitney & Kellogg, H. W. Miller, Mt. Morris; Dr. D. D. Ingham, Lima; D. A. Chapman, Canandaigua; Edward Niles, Dansville; S. D. Spring, Hinckport; Dr. H. Campbell, Caledonia; N. S. Bryant, LeRoy; Lansing & Judd, Warsaw; S. & B. B. Higgins, Perry; M. H. Dales, Caylerville; J. Bryan & Co., Rochester; Dr. O. Davis, Alden. G. H. Taylor, Shelburn Falls, Massachusetts; Bidwell & Woodbury, Adrian, Michigan.

SAMUEL WARREN.
York, Livingston Co., N. Y., July 5, 1854. 236-1t



A NEW TRUSS.

The above Truss, patented January 17th, 1854, has been successfully used in a large number of cases, both in old and recent ruptures. It can be applied to children as well as to older persons, to a rupture of the navel, as well as to one of the groin. The pads and spring can be adjusted so that a greater or less degree of pressure can be brought to bear upon the rupture, at the desire of the wearer. It seldom fails to give the greatest amount of ease and comfort, and in recent cases curing the patient in the course of six months or a year.

This Truss can be obtained of the subscriber, at Moscow, Livingston county, N. Y., where all orders will be promptly attended to. [236-3t] L. B. WHITE.

FARM FOR SALE.

The subscriber offers for sale the farm on which he now resides, situated in the town of Portage, Liv. Co., N. Y., containing 100 acres. The farm is about 4 miles from the village of Nunda, 3 miles from the famous Portage Bridge, and ¾ mile from Hunt's Hollow Station, on the Buffalo and N. Y. City Railroad,—within 14 hours ride of New York city and 2 hours of Buffalo. The soil is of the first quality, well suited to wheat or any crop usually raised in Western New York, and well watered. On the premises is a choice selection of fruit of the various kinds usually cultivated, in good bearing condition. The buildings are good and convenient. Any one wishing to engage in the Nursery business, would find it a very desirable location, as the soil is admirably adapted to the culture of fruit trees and every variety of fruit. It will be sold on most reasonable terms—most of the purchase money remaining 8 or 9 years if desired. G. WING.

Hunt's Hollow, Liv. Co., N. Y., July, 1854. 235-3t

THE GREAT RED DRAGON,

OR, THE MASTER KEY TO POPERY.

BY ANTHONY GAVIN,

CATHOLIC PRIEST, OF SARAGOSSA, SPAIN.

BOOK AGENTS WANTED,

To sell the work which is now ready, and surpasses in detail and interest any other work on the subject of Popery ever issued. The terrible revelations which it contains will startle every Protestant with horror, as coming from one who was a participator in the bloody deeds, and who has had the best opportunity ever possessed by any man to unveil the mysteries of the Great Babylon of Popery.

Finely Illustrated. Address immediately,
SAMUEL JONES, Publisher,
235-5t 80 Washington St., Boston, Mass.

CAVEATS.—Inventors and others desiring to apply for Caveats, are informed that all the necessary drawings and papers are prepared by the undersigned, with the utmost dispatch and on the most moderate terms. All other Patent business promptly attended to.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. ALFRED E. BEACH,
Solicitor of American and Foreign Patents, People's Patent Office, 86 Nassau st., New York. 235-4t

PATENT AGENCY.

Inventors can have their drawings and papers prepared under their own inspection, by applying to

JOHN PHIN, C. & M. E. Agent for procuring and for the sale of Patents, 16 Buffalo St., Rochester, N. Y.

Particular attention paid to rejected applications, and to Chemical Patents.

Will also send the claim of any invention patented within the last 14 years, on receipt of one dollar. PATENT RIGHTS FOR SALE. 235-1f

A VALUABLE FARM FOR SALE.

Situated in the town of Conquest, 4 miles northwest of Weedsport, a good market on the Canal, and 33½ from Rochester & Syracuse direct Railroad. Said Farm contains 163 acres; 140 improved and in a good state of cultivation; well adapted for all kinds of produce, and well situated for two farms if desirable, as there are two houses and two barns, two orchards containing a good variety of fruit, also a wood lot on each end of the farm. Thirty-five acres can be put in to wheat this fall. Said farm can be had cheap; terms easy, and possession given when desired. Stock and farming implements can be had if desirable. For further particulars inquire of the subscriber on the premises.

234-24p JACOB EAKER.
Weedsport, Cayuga Co., N. Y., June 19th, 1854.

GAFFNEY, BURKE & CO.,

IMPORTERS, WHOLESALE AND RETAIL DEALERS IN

Foreign and Domestic Dry Goods,

No. 53 Main Street, and Nos. 1 and 3 North St. Paul Street,

GAFFNEY'S BLOCK, ROCHESTER,

Have now in store one of the largest stocks of Dry Goods ever brought to this city, in which may be found every desirable article of Ladies' and Gents' Dress Goods, adapted to the season. Their improved facilities for importing, and the great advantage of having a resident partner in New York, daily attending the Auction Sales, enable them to offer to Merchants and Dealers, by piece, case or bale, as cheap as can be purchased in the New York and Boston Markets.

WHOLESALE ROOMS Nos. 1 & 3 North St. Paul St., GAFFNEY'S BLOCK, ROCHESTER.

Summer Dress Goods.—We have just opened a very large stock of Summer Dress Goods, consisting of a fine assortment of Brilliants, plain and figured Barèges and Tissues, plaid and striped Pongee Silks, Muslins, plaid and striped Lawns, Printed Jacourts, &c., &c. The styles are entirely new and beautiful.

GAFFNEY, BURKE & CO., 53 Main St., Rochester.

Broche and Crape Shawls.—We have now on hand a very large stock of Broche and Crape Shawls, all colors and qualities, which we are selling at very great bargains, as they were purchased much less than cost to import, at an Auction Sale.

GAFFNEY, BURKE & CO.,
Gaffney's Block, 53 Main St., Rochester.

More New Silks.—We have just received another large assortment of Summer Silks, from an Auction Sale, which were purchased CHEAP FOR CASH, and will be sold at less than cost to import. The styles are very handsome and entirely new. We have also just received 40 pieces of those celebrated BLACK SILKS, which we are selling as cheap as usual. GAFFNEY, BURKE & CO.,
53 Main St., Gaffney's Block, Rochester.

FARM FOR SALE.

About engaging in other business, I will sell my farm at a bargain. It contains 38 acres of good land, well watered by durable springs—situated nearly 1½ miles from Macedon station, on N. Y. Central Railroad, and about 2 miles from Macedon locks. On the farm are suitable farm-buildings and a young orchard of excellent fruit. For further particulars inquire of S. L. SHOTWELL,
233-4t* Macedon Centre, Wayne Co., N. Y.

SAVERY'S TEMPERANCE HOTEL,

AND

TELEGRAPH DINING SALOON,

No. 14 Beekman Street, N. Y.

Kept on the European plan. Meals at all hours of the day. Lodging Rooms, from $2 to $3 per week, or 50 cts. per night.

Bela Sawyer, Sup't. John S. Savery, Proprietor. 233-4t

WOOD AND COPPER PLATE ENGRAVING.

Miller & Mix, Heliogoes and Engravers, No. 10, third story, Arcade, Rochester, N. Y., will be happy to exhibit specimens of their work, embracing a great variety of book illustrations, views of public and private buildings, landscapes, portraits, machinery, society seals, &c. Particular attention given to engraving Agricultural Implements, Portraits of Domestic Animals, &c.

Invitation, Wedding, Visiting and Business Cards Engraved and Printed at short notice, and in a style to give entire satisfaction. Orders by mail will receive as prompt attention as though ordered personally. L. C. MIX,
233-1f JOHN MILLER.

CHAIN HORSE-POWERS, THRESHERS, &C.

Endless Chain Horse-Powers, Threshers and Riddles, (lately improved,) made and sold by the subscribers, at Central Hedge, Schoharie Co., N. Y. Warranted to suit. Price, for two horse machines, $155.

One of these machines threshed the wheat allotted it for trial, at the trial of Agricultural Implements, at Geneva, in July, 1853, in less time (and gave a better percentage of clean grain,) than any other machine on the ground, considering the amount of power applied.

230-4teow. G. WESTINGHOUSE & CO.

HALLOCK'S AGRICULTURAL WAREHOUSE AND SEED STORE.

Emery's Horse Powers, Threshing Machines and Separators, Circular and Crosscut Saw Mills, Clover Hullers, Hay Cutters, Corn Shellers, together with other Machines fitted for Horse Power. Also, Plows, Harrows, Cultivators, Reaping Machines, Seymour's Grain Drills, &c. Hay Cutters of various sizes, for hand use—Road Scrapers, Horse Rakes, Ox Yokes and Bows, Agricultural and Horticultural Implements generally. Also—Grass, Field and Garden Seeds, of the best imported and Shaker growth.

E. D. HALLOCK.

Warehouse and Sale Rooms No. 24 Exchange Street, Rochester, N. Y. 226-tf

LAND PLASTER

At Canandaigua, Victor, and Fisher's Railroad Depots. The subscribe has on hand at each of the above Railroad Stations, 500 tons of pure, fresh ground land Plaster.—Farmers can depend upon getting their Plaster at the above places, of a superior quality and not kiln dried.

217-4m. JIREH ROWLEY.

KETCHUM'S MOWING MACHINE.

This machine stands without a successful rival, as *the mowing machine of the age*. The supply will not be equal to the demand. If any person desires one for the coming season, they cannot speak too soon. The uniform price at Buffalo is $110,00. All who will forward us an order accompanied with the cash or satisfactory reference, may depend upon being faithfully served with a machine in good season. H. C. WHITE & CO.,

Buffalo Ag. Warehouse and Seed Store, 11 & 13 West Seneca street, Buffalo, N. Y 211tf.

Poetical.

(Written for the Rural New-Yorker.]

MY SISTER.

BY J. H. MILLER.

I had a little sister once,
A blue-eyed, laughing maid,
How bleak is every spot, where I
With that dear sister, played!
The garden, where we watched the flowers
Unfold their petals fair,
How oft I seek its rosy bowers
As if to meet *her* there!

The spring, which gushes cold and clear
From out the steep hill side,
Whence, stealing softly through the fields
Its limpid waters glide;
How oft I gaze into its depths
And fancy I can trace,
Reflected there, as long ago,
Her graceful, roguish face!

I wander through the sylvan aisles
Of forests dark and dim,
And on my ear, in cadence sweet,
Falls nature's pealing hymn.
But every note thrills through my heart,
And blinding tear-drops fall,
For she is dead, whose bird-like laugh,
Was sweeter than them all.

One sunny day in early spring,
We wandered, hand in hand,
In search of pretty stones and shells,
Along the ocean strand.
We climbed a rock to pluck a flower,
And standing there, we spied
Another, blooming far below,
Swayed by the rising tide.

We scrambled down the shelving cliff—
My sister was before;
She stretched her hand to snatch the flower,
And, reeling, toppled o'er!
One parting look she bent on me,
And then the flashing wave
Closed o'er her form, for I, alas!
I had no power to save.

For down beneath the glassy brine
She sleeps a dreamless sleep,
While o'er her head forever swells
The music of the deep.
The flowers she loved still brightly bloom,
But bloom for her no more,—
She wanders free 'mong fairer flowers
On heaven's eternal shore!

Russell, Geauga Co., O., 1854.

Rural Sketch Book.

[Written for Moore's Rural New-Yorker.]

THE USURER AND HIS VICTIM.

BY MRS. M. W. B.

In every community will be found men who have accumulated money, perhaps honestly, who possess an inordinate desire to increase it in the surest and most rapid manner possible, and too often resort to means for the accomplishment of that end, regardless of the consequences to others. I will refer directly to the practice of "*shaving notes*," and lending money on exorbitant interest — or, in other words, "making other men's necessities their opportunities." To satisfy an elastic conscience, they say it is a strictly honest operation, because the borrower, or giver of a note, acts voluntarily. Is this always the fact? Certainly not, for, in nine cases out of ten, the victim is so entangled in a mesh of circumstances, that he loses the actual control of his own affairs.

I was about to suppose a case, but that is unnecessary, as instances similar to the following are not of rare occurrence, and serve to illustrate the operations of the system.

Perhaps Mr. A., a worthy and industrious man, purchases of Mr. B. a small place, for which he pays four hundred dollars, and gives his note for one hundred more, payable in one year. The day arrives for its payment, and finds Mr. A. without the means to meet it.—Mr. B., unwilling to distress his debtor, and unable to do without the money, sells the demand to a "note-shaver" for ninety dollars.—After the lapse of a few months, it is again presented for payment. Mr. A., still unable to pay it, is threatened with an execution; to avoid this, and purchase a still further reprieve, he agrees to give his creditor a cow—perhaps the only one—in the hope that the business in which he is engaged will soon enable him to pay the debt. But his customers fail to pay him, and another pay-day arrives,—another execution is threatened,—another reprieve purchased—each time interest added, and a new note given, until by piecemeal his little property is swallowed up, and he is forced to leave the place which he purchased with a reasonable prospect of its being a permanent home. Were these acts of Mr. A. voluntary?

I will relate another case in point. It is the experience of an individual whom I shall call Mr. R., from whom I received some of the details, which are here given as a warning to young men to beware of the "Shylocks," who seek to become rich, by taking advantage of the necessities and misfortunes of their fellow men. Such cases as this may not be of so frequent occurrence as the above, but in its general aspect is a counterpart to the experience of many others.

Mr. R., some years since, located himself in a central and populous town in one of our Western States, and engaged in mercantile and other business to a considerable extent. Industrious and enterprising, he was for a time eminently successful. At what he considered a favorable moment, he invested most of his property in real estate, which was at that time rapidly rising in value. Sharing in the spirit of *improvement* which characterized the times and place, he had recourse to bank accommodations to continue and carry out his plans. This answered his purpose for a while, but then came a change—a blighting change—in the financial affairs of the country, and many, very many, who believed themselves rich, inevitably sunk to "poor man's estate." Real estate shared in the general depression; and Mr. R., buoyed up by the hope of better prospects when the crisis should have passed, and unwilling to sell his property at such depreciated value, had recourse to Mr. Shrub, who kept an office, and made a business of "shaving notes," and granting loans on short dates for a very high rate of interest. Mr. R. made some arrangements by which he obtained the requisite amount. Circumstances, and the state of business generally, induced him to continue this method of obtaining temporary relief during two or three years, paying Mr. Shrub hundreds of dollars for extra interest, living in the belief that a favorable change would occur—every month losing more and more of the power to control his own affairs.

Previous to Mr. R.'s first application to Mr. Shrub, he had commenced a manufacturing business with another individual, who mortgaged his share to obtain the means of carrying on their operations. The business went on,—Mr. R. lessened his liabilities to a large amount; yet there remained heavy demands against him, and Mr. Shrub held a claim on a great portion of his real estate, and actually seized on Mr. R.'s share of the manufacturing business.

Business becoming more and more depressed, and money extremely scarce, it was agreed by the partners to sell their establishment.—The mortgagee of Mr. R.'s partner thought the property worth ——— dollars, and on the day of sale was willing to bid accordingly, in opposition to Mr. Shrub, his only competitor. While the bid was in the hands of the latter, he told his opponent, who did not want it, that they might as well take the property *together* at the bid then made, as to run it up any higher. It was accordingly knocked down for little more than half its acknowledged value. Subsequently the mortgagee of Mr. R.'s partner paid to the latter a sum that made up the amount of his portion equal to the real value, or what the mortgagee thought it worth previous to the sale. Mr. Shrub was solicited to do the same for Mr. R., but refused.

The situation of Mr. R. became indeed trying—as yet no star gleamed on his prospects—all was dark, and he was obliged to close up his affairs. He made arrangements with his creditors to place his property in the hands of a trustee, and have it sold for their benefit.—Mr. Shrub was made trustee, and received the commissions and expenses incident to settling such concerns, which, with usurious interest, &c., made up a sum out of Mr. R.'s property sufficient to purchase a homestead that would satisfy any unambitious man. Mr. R.'s debts were fully discharged, and he was left a *poor man*. "Cast down, but not dismayed," he left the scene of his misfortunes, and sought by labor, in a rural and retired situation, if not to retrieve his fortune, to earn a competent support, free from the turmoils and harassing cares incident to an active and extensive business. But while enjoying this tranquillity, a calamity far greater than the loss of property came upon him—month after month his sight gradually failed away, till he became *almost blind*. In this situation he was for nearly two years mainly dependent on the industry of his wife for support.

At length, by a successful surgical operation, Mr. R.'s sight was partially restored, but his health and energies so much impaired, that very few avocations could be adopted with reasonable hope of success. In following one of those few avocations, he once more sought the scene of his highest hopes of success in life, and of their blight. He there found that the *Shrub* had expanded its branches, and struck deep its roots, overshadowing many frail plants that were destined to perish for the lack of that genial sunshine that their position denied.

During the time that has elapsed since the sale of Mr. R.'s property, the country has enjoyed an unparalleled degree of prosperity, and real estate has become even more valuable than he anticipated. In view of his situation, and recollecting that Mr. Shrub was a "high-professing" church-member, he appealed to him to render this simple act of justice, namely, to pay to him the same sum his former partner had received from the mortgagee of his share of their joint property. But this was denied;—even the appeal, which was one that should have moved the slumbering conscience, was treated with silent contempt. In closing his last letter to Mr. Shrub, after reviewing their former transactions, Mr. R. says: "My sight is still so imperfect, that it is but little I can do. You have recently seen on the streets and on the roadside, a person that appears to be an old man, with a cane, traveling from house to house, for the purpose of selling a few hooks, whereby to gain a small pittance towards the maintenance of himself and family. I do not mention this as being degrading. Although it is a business in which *impositions* have been practiced, it CAN *be honestly* and honorably pursued. This man you once knew as a merchant and citizen, with whom you had various and extended dealings; he now makes this last appeal to *your honor and justice*, not to your *charity*, and this, not for the sake of himself, but of those who have natural claims on him for support."

Mr. R., like thousands of others, became the *slave of circumstances*. While sitting in darkness, and contemplating the transactions of his past life, he made a very proper and firm resolve, that as in all communities there are likely to be Shrubs, he would not omit any opportunity of warning young men to be careful, and avoid, as much as in them lies, all circumstances that tend in any degree to destroy their free-agency in any of the business operations of life.

ONE GLASS OF WINE.

A very interesting story of the birth, parentage, and rise to power of the Emperor of France, is given in *Harper's Magazine*. Included in that article, we also find the history of "one glass of wine," as follows:

The Duke of Orleans, the eldest son of King Louis Phillippe, was the inheritor of whatever rights the royal family could transmit. He was a noble young man—physically and intellectually noble. One morning he invited a few companions with him, as he was about to take his departure for Paris to join his regiment.—In the conviviality of the hour, he drank a little too much wine. He did not become intoxicated: he was not in any respect a dissipated man. His character was lofty and noble.—But in that joyous hour he drank a glass too much. He slightly lost the balance of his body and of his mind. Bidding adieu to his companions he entered his carriage.

But for that extra glass of wine he would have kept his seat. He leaped from the carriage. But for that extra glass of wine he would have alighted on his feet. His head struck the pavement. Senseless and bleeding he was taken into a beer shop and died. That extra glass of wine overthrew the Orleans dynasty, confiscated their property of one hundred millions of dollars, and sent the whole family into exile.

MATHEMATICAL QUESTION.—Suppose two couriers, A and B, start from places directly opposite, to meet each other? A leaving the town C, at the same time B leaves D. A travels 4 miles, and B, 5 miles per hour; A is detained 2 hours on the road while B is detained but 1. Now, how far will each travel, allowing the distance to be 140 miles from C. to D.?

Geneva, N. Y., 1854. M. L. S.

Answer to Miscellaneous Enigma in No. 27.— *Tempest Insurance Company.*

Wit and Humor.

"CUT LOOSE AGAIN, MISTER."

A friend of ours, who is a most accomplished salesman, and who is kept very busy in one of the up-town dry goods houses, was complimented, not long since, in a manner and form as follows, to wit:

He had a countryman in the store, and was showing him a very handsome piece of ladies' dress goods, not with any great hope of selling it; still there was some slight chance, and besides, it is necessary—so our friend avers—to keep constantly in practice. So he dashed ahead in fine style, praised the richness of the pattern, extolled the texture of the fabric, held it up to a favorable light, avouched for its ultra fashionableness; and, in short, let loose a torrent of eloquence, in which it was difficult to distinguish which was the more flattered, the taste of the admiring rustic or the quality of the magnificent *mousseline*. Brumpkin's eye flashed with gratified pride at the complimentary allusions to himself, and unconcealed astonishment at the development of beauty in the goods and fluency in the salesman. Catching our friend by the arm, he exclaimed, "Stop right here one minute!" and dashed out of the store with two or three rapid bounds. Grasping a stool, a little hotbrecl, holding the bolt of goods across both hands, just as though he had frozen in the attitude in which he had thoroughly impressed the rural gentleman.—Meanwhile the latter individual whisked two bouncing girls out of a carryall which stood in front of the store, and half pulling, half pushing them, brought them up in front of the fluent tongue.

"Girls! stand there—right there, Sally—*and now, Mister, cut loose again! I just want the gals to hear you!*"

It is almost needless to say, in view of the peculiarity of the circumstances, that our friend was utterly overwhelmed with his emotions, and for once in his life failed in his utterance—to the great disappointment of the father and both daughters.—*Montgomery (Ala.) Mail.*

One of Rev. Dr. Cox's Stories.—A good brother in a western church, had a call to preach. Being unable to read, he employed a friend to read the Scripture lesson. On one occasion, the chapter selected was Genesis xxii., which contains the words, "*Three right did Milcah bear to Nahor, Abraham's brother.*" This text stuck in the preacher's memory, and he discoursed therefrom as follows:—"Brethren and sisters, let us consider our blessings. We have all the comforts of life. We have our flocks and herds, and our hearts are filled with food and gladness. Morning and evening our wives and daughters milk the cows, and our wants are all supplied. In the days of good old Abraham, the case was different, for then, as you have heard, it *took eight to milk a bear*, and they did not get much at that.

A Cute Trick.—A bright little girl, four years of age, was riding in the country, with her uncle, a short time since, when in passing a farm-yard, they saw a peacock:

"Oh! look, look! look!" said the little girl, "see the pretty bird!"

"Yes," said her uncle, but without stopping.

"But, stop the horse uncle, I want to look at him longer," said little Mary.

"I can't now," said he, "I'm in a hurry."

Mary hesitated a moment, then giving her doll, which she held in her hand, a toss to the side of the road,

"There, uncle Ed," said she, "you get out and pick up my baby, while I look at the bird!"

A merchant examining a hogshead of hardware, on comparing it with the invoice, found it all right, except a hammer less than the invoice. "Och! don't be troubled," said the Irish porter, "sure the nagur took it out to open the hogshead with."

The following bit of rhetoric occurs in a speech made in Congress by the Hon. Christian Straub, of Pennsylvania:—This, to my mind, is the best proof I ever saw that the lion and the lamb never were created to be birds of a feather."

"The Turkish quarrel smells in the nostrils of Europe," writes an indignant and olfactory journalist. No wonder while one party is an Otto man, and the other a Musky might.

It was a Portland lady that said she would make a poor sailor, and to which a nautical friend replied, "But you would make an excellent *mate* though."

You have no business to have business with other people's business; but mind your own business, and that is business enough for any business man.

When a boy passes through a graveyard in the night, does he whistle to keep his own spirits up, or keep the spirits of other people down?

The reason why so few marriages are happy is because young ladies spend their time in making nets, not in making cages.—*Swift.*

A gentleman who did not trust to his memory wrote in his memorandum-book:—"I must be married when I get to town."

An advocate of capital punishment argues that the gallows are calculated to elevate mankind.

How can a man be turned into a tumbler? By turning the contents of a tumbler into him.

Why is Russia like Rome in the golden age? Because it has a C—zar at its head.

THE WOOL GROWER AND STOCK REGISTER.

VOL. VI.—ENLARGED AND IMPROVED!

The Wool Grower and Stock Register is the *only* American journal devoted to the important and profitable branches of *Wool and Stock Husbandry*. It contains a vast amount of *useful* and *reliable* information on the above and kindred subjects, and should be in the hands of every owner or breeder of Sheep, Cattle, Horses, Swine, or Poultry—whether located East or West, North or South, for the most of the matter given in its pages is equally adapted to all sections of the Union. The Current, &c. The Sixth Volume, commencing July, 1854, will be

Enlarged to 32 Octavo Pages Monthly!

And improved in both Contents and Appearance. Among other matters of interest to Wool Growers, Breeders, Graziers, Dairymen, &c., the new volume will contain Pedigrees of Pure-Bred Cattle, Horses, Sheep, etc., and the Names and Residences of the principal Breeders and Owners of Improved Stock throughout the country. It is published in the best style, and illustrated with many Engravings—including Portraits of Historic Animals, Designs of Farm Buildings, &c., &c. The careful Reviews of the Wool and Cattle Markets, given in each number, are alone worth many times the price of the paper.—To Wool Growers this feature is invaluable.

TERMS—Only Fifty Cents a Year; Five Copies for $2; Eight for $3,—*in advance*. Any additional number at 37½ cents per copy. Club papers will be sent to different post-offices, if desired. ☞ Back volumes (well bound in paper, for mailing) furnished at above rates.

☞ Now is the Time to Subscribe and form Clubs. Money, properly enclosed, may be mailed at our risk, if addressed to D. D. T. MOORE, Rochester, N. Y.

HOME PROTECTION.

Tempest Insurance Company, Capital $250,000, Organized December 24, 1852; Chartered March 1, 1853. Houses only Insured by this Company. No one risk taken for more than $3,000.

Many distinguished persons have insured their homes, to the amount of $3,000 each, in this Company, among whom are Ex-President Van Buren, Kinderhook; Ex-Governor Seward, Auburn.

Auburn, May 16th, 1853.

To whom it may concern.—We are personally acquainted with many of the Officers and Directors of the Tempest Insurance Company, located at Meridian, Cayuga Co., N. Y. In our opinion they are among the most wealthy and substantial class of Farmers in this county.

J. N. STARIN,
ELMORE P. ROSS,
THOMAS Y. HOWE, Jr.

The above gentlemen will be recognized as the Cashier of Cayuga County Bank, Auburn; Postmaster, Auburn, and Ex-Member of Congress, Auburn, Cayuga County.

N. B.—The public are cautioned to bear in mind the name, (*Tempest,*) and not submit to an imposition daily practiced by two-by-four Mutual Co's.

234-tf C. R. TIMBY, Secretary.

VALUABLE FARM FOR SALE,

In the town of Penfield, Monroe Co., N. Y., containing 61¾ acres, 50 of which are under improvement; with a good stone house and out-buildings, good fruit of all kinds, 8 acres of wheat, 8 acres of corn and potatoes, 12 acres of oats, and 6 acres of grass on the premises. The farm is pleasantly located, on a good road, 10 miles east of Rochester, 100 rods north of Lovell's Corners, 3 miles from Fairport Depot, a pleasant village, and in sight of the school-house and Brick church. Price, $3,500; one-third of the purchase money can lay on bond and mortgage for a term of years.

Also, a house and lot, with good fruit and well of water, at Lovell's Corners, for sale cheap. Inquire on the premises for further particulars, or address S. D. WAIT.

Penfield, Monroe Co., N. Y., June, 1854. 234-tf

Address T. P. REMINGTON,
232-5t* No. 22 South Front-st. Philadelphia.

THE PEOPLE'S PATENT OFFICE.

This well known establishment is still carried on under the personal superintendence of the undersigned, by whom all the necessary drawings, specifications, and documents, for Patents, Caveats, Designs, Foreign Patents, &c., are prepared with the utmost fidelity and dispatch, on very moderate terms.

Persons wishing for information or advice relative to Patents or Inventions, may at all times consult the undersigned *without charge*, either personally at his office, or by letter. To those living at a distance, he would state, that all the needful steps necessary to secure a Patent, can be arranged by letter, just as well as if the party were present, and the expense of a journey be thus saved. When parties wish to be informed as to the probability of being enabled to obtain Patents, it will be necessary for them to forward by mail a rough outline sketch and description of the inventions. No fee or charge is made for such examinations.

Private consultations held daily with inventors from 9 A. M. to 5 P. M. All consultations and business strictly private and confidential.

Models from a distance may be sent by express or otherwise. For further information apply to or address, post-paid, ALFRED E. BEACH,

Editor and Proprietor of the People's Journal, Solicitor of American and Foreign Patents. People's Patent Office, 86 Nassau-street, New York. 227-13t

THE PEOPLE'S JOURNAL, a record of Science, Mechanics, Invention and Agriculture.
